NOVEMBER, 1882.

NO. I.

---

## VENICE.

It is a great pleasure to write the word; but I am not sure there is not a certain impudence in pretending to add anything to it. Venice has been painted and described many thousands of times, and of all the cities of the world it is the easiest to visit without going there. Open the first book and you will find a rhapsody about it; step into the first picture-dealer's and you will find three or four high-colored "views" of it. There is nothing more to be said about it. Every one has been there, and every one has brought back a collection of photographs. There is as little mystery about the Grand Canal as about our local thoroughfare; and the name of St. Mark is as familiar as the postman's ring. It is not forbidden, however, to speak of familiar things, and I believe that, for the true Venice-lover, Venice is always in order. There is nothing new to be said about it certainly, but the old is better than any novelty. It would be a sad day, indeed, when there should be anything new to say. I write these lines with the full consciousness of having no information whatever to offer. I do not pretend to enlighten the reader; I pretend only to give a filip to his memory; and I hold any writer sufficiently justified who is himself in love with his topic.

I.

MR. RUSKIN has given it up, that is very true; but it is only after extracting half a life-time of pleasure and an immeasurable quantity of fame from it. We all may do the same, after it has served our turn, which it probably will not cease to do for many a year to come. Meantime, it is Mr. Ruskin who, beyond any one, helps us to enjoy. He has, indeed, lately produced several aids to depre-

sion in the shape of certain little humorous—ill-humorous—pamphlets (the series of "St. Mark's Rest"), which embody his latest reflections on the subject of Venice and describe the latest atrocities that have been perpetrated there. These latter are numerous and deeply regrettable; but to admit that they have spoiled Venice would be to admit that Venice is easily spoiled,—an admission pregnant, as it seems to us, with disloyalty. Fortunately, one reacts against the Ruskinian contagion, and one hour of the lagoon is worth a hundred pages of demoralized prose. This queer, late-coming prose of Mr. Ruskin (including the revised and condensed issue of the "Stones of Venice," only one little volume of which has appeared, or, perhaps, will ever appear) is all to be read, though much of it seems to be addressed to children of tender age. It is pitched in the nursery-key, and might be supposed to emanate from an angry governess. It is, however, all suggestive, and much of it is delightfully just. There is an inconceivable want of form in it, though the author has spent his life in laying down the principles of form, and scolding people for departing from them; but it throbs and flashes with the love of his subject,—a love disconcerted and abjured, but which has still some of the force of inspiration. Among the many strange things that have befallen Venice, she has had the good fortune to become the object of a passion to a man of splendid genius, who has made her his own, and, in doing so, has made her the world's. There is no better reading at Venice, therefore, as I say, than Ruskin, for every true Venice-lover can separate the wheat from the chaff. The narrow theological spirit, the moralism *à tout propos*, the queer provincialities and pruderies, are mere wild weeds in a mountain of flowers. One may

doubtless be very happy in Venice without reading at all,—without criticising or analyzing, or thinking a strenuous thought. It is a city in which, I suspect, there is very little strenuous thinking, and yet it is a city in which there must be almost as much happiness as misery. The misery of Venice stands there for all the world to see; it is part of the spectacle,—a thorough-going devotee of local color might consistently say it is part of the pleasure. The Venetian people have little to call their own,—little more than the bare privilege of leading their lives in the most beautiful of towns. Their habitations are decayed; their taxes heavy; their pockets light; their opportunities few. One receives an impression, however, that life presents itself to them with attractions not accounted for in this meager train of advantages, and that they are on better terms with it than many people who have made a better bargain. They lie in the sunshine; they dabble in the sea; they wear bright rags; they fall into attitudes and harmonies; they assist at an eternal *conversazione*. It is not easy to say that one would have them other than they are, and it certainly would make an immense difference should they be better fed. The number of persons in Venice who evidently never have enough to eat is painfully large; but it would be more painful if we did not equally perceive that the rich Venetian temperament may bloom upon a meager diet. Nature has been kind to it, and sunshine and leisure and conversation and beautiful views form the greater part of its sustenance. It takes a great deal to make a successful American; but to make a happy Venetian takes only a handful of quick sensibility. The Italian people have, at once, the good and evil fortune to be conscious of few wants; so that if the civilization of a society is measured by the number of its needs, as seems to be the common opinion to-day, it is to be feared that the children of the lagoon would make but a poor figure in a set of comparative tables. Not their

misery, doubtless, but the way they elude their misery, is what pleases the sentimental tourist, who is gratified by the sight of a beautiful race that lives by the aid of its imagination. The way to enjoy Venice is to follow the example of these people, and make the most of simple pleasures. Almost all the pleasures of the place are simple; this may be maintained even under the imputation of ingenious paradox. There is no simpler pleasure than looking at a fine Titian,—unless it be looking at a fine Tintoretto, or strolling into St. Mark's,—it is abominable, the way one falls into the habit,—and resting one's light-wearied eyes upon the windowless gloom; or than floating in a gondola, or hanging over a balcony, or taking one's coffee at Florian's. It is of these superficial pastimes that a Venetian day is composed, and the pleasure of the matter is in the emotions to which they minister. These, fortunately, are of the finest; otherwise, Venice would be insufferably dull. Reading Ruskin is good; reading the old records is, perhaps, better; but the best thing of all is simply staying on. The only way to care for Venice, as she deserves it, is to give her a chance to touch you often,—to linger and remain and return.

## II.

THE danger is that you will not linger enough,—a danger of which the author of these lines had known something. It is possible to dislike Venice, and to entertain the sentiment in a responsible and intelligent manner. There are travelers who think the place odious, and those who are not of this opinion often find themselves wishing that the others were only more numerous. The sentimental tourist's only quarrel with his Venice is that he has too many competitors there. He likes to be alone; to be original; to have (to himself, at least) the air of making discoveries. The Venice of

VENICE. (FROM THE PAINTING BY D. MARTIN RICO. BY PERMISSION OF A. J. DREXEL.)

A VENETIAN BALCONY.

to-day is a vast museum where the little wicket that admits you is perpetually turning and creaking, and you march through the institution with a herd of fellow-gazers. There is nothing left to discover or describe, and originality of attitude is completely impossible. This is often very annoying; you can only turn your back on your impertinent playfellow and curse his want of delicacy. But this is not the fault of Venice: it is the fault of the rest of the world. The fault of Venice is that, though it is easy to admire it, it is not so easy to live in it. After you have been there a week, and the bloom of novelty has rubbed off, you wonder whether

you can accommodate yourself to the peculiar conditions. Your old habits become impracticable, and you find yourself obliged to form new ones of an undesirable and unprofitable character. You are tired of your gondola (or you think you are), and you have seen all the principal pictures and heard the names of the palaces announced a dozen times by your gondolier, who brings them out almost as impressively as if he were an English butler bawling titles into a drawing-room. You have walked several hundred times around the Piazza, and bought several bushels of photographs. You have visited the antiquity-mongers, whose horrible sign-boards dis-

honor some of the grandest vistas in the Grand Canal; you have tried the opera and found it very bad; you have bathed at the Lido and found the water flat. You have begun to have a shipboard-feeling,—to regard the Piazza as an enormous saloon and the Riva degli Schiavoni as a promenade-deck. You are obstructed and encaged; your desire for space is unsatisfied; you miss your usual exercise. You try to take a walk, and you fail, and meantime, as I say, you have come to regard your gondola as a sort of magnified baby's cradle. You have no desire to be rocked to sleep, though you are sufficiently kept awake by the irritation produced, as you gaze across the shallow lagoon, by the attitude of the perpetual gondolier, with his

ness. The loss is your own, moreover; it is not,—with all deference to your personal attractions,—that of your companions who remain behind; for though there are some disagreeable things in Venice, there is nothing so disagreeable as the visitors. The conditions are peculiar, but your intolerance of them evaporates before it has had time to become a prejudice. When you have called for the bill to go, pay it and remain, and you will find on the morrow that you are deeply attached to Venice. It is by living there from day to day that you feel the fullness of its charm; that you invite its exquisite influence to sink into your spirit. The place is as changeable as a nervous woman, and you know it only when you know all the

FEEDING THE PIGEONS IN ST. MARK'S SQUARE.

turned-out toes, his protruded chin, his absurdly unscientific stroke. The canals have a horrible smell, and the everlasting Piazza, where you have looked repeatedly at every article in every shop-window and found them all rubbish, where the young Venetians who sell bead-bracelets and "panoramas" are perpetually thrusting their wares at you, where the same tightly buttoned officers are forever sucking the same black weeds, at the same empty tables, in front of the same *caffès*,—the Piazza, as I say, has resolved itself into a sort of magnificent tread-mill. This is the state of mind of those shallow inquirers who find Venice all very well for a week; and if in such a state of mind you take your departure, you act with fatal rash-

aspects of its beauty. It has high spirits or low, it is pale or red, gray or pink, cold or warm, fresh or wan, according to the weather or the hour. It is always interesting and almost always sad; but it has a thousand occasional graces, and is always liable to happy accidents. You become extraordinarily fond of these things; you count upon them; they make part of your life. Tenderly fond you become; there is something indefinable in those depths of personal acquaintance that gradually establish themselves. The place seems to personify itself, to become human and sentient, and conscious of your affection. You desire to embrace it, to caress it, to possess it; and, finally, a soft sense of possession grows up, and your visit becomes a per-

THE BRIDGE OF SIGHS.

petual love-affair. It is very true that if you go there, like the author of these lines, about the middle of March, a certain amount of disappointment is possible. He had not been there for several years, and in the interval the beautiful and helpless city had suffered an increase of injury. The barbarians are in full possession, and you tremble for what they may do. You are reminded, from the moment of your arrival, that Venice scarcely exists any more as a city at all; that it exists only as a battered peep-show and bazaar. There

was a horde of savage Germans encamped in the Piazza, and they filled the Ducal Palace and the Academy with their uproar. The English and Americans came a little later. They came in good time, with a great many French, who were discreet enough to make very long repasts at the Caffè Quadri, during which they were out of the way. The months of April and May, of the year 1881, were not, as a general thing, a favorable season for visiting the Ducal Palace and the Academy. The valet-de-place had marked them for his own and held triumphant possession of them. He celebrates his triumphs in a terrible brassy voice, which re-sounds all over the place, and has, whatever

ST. MARK'S AND THE CAMPANILE.

language he be speaking, the accent of some other idiom. During all the spring months in Venice these gentry abound in the great resorts, and they lead their helpless captives through churches and galleries in dense, ir-

little warrant for regarding it as a religious affair. The restoration of the outer walls, which has lately been so much attacked and defended, is certainly a great shock. Of the necessity of the work only an expert is, I sup-

IN ST. MARK'S.

responsible groups. They infest the Piazza; they pursue you along the Riva; they hang about the bridges and the doors of the *caffès*. In saying just now that I was disappointed at first, I had chiefly in mind the impression that assails me to-day in the whole precinct of St. Mark's. The condition of this ancient sanctuary is surely a great scandal. The peddlers and commissioners ply their trade—often a very unclean one—at the very door of the temple; they follow you across the threshold, into the sacred dusk, and pull your sleeve, and hiss into your ear, scuffling with each other for customers. There is a great deal of dishonor about St. Mark's altogether, and if Venice, as I say, has become a great bazaar, this exquisite edifice is now the biggest booth.

### III.

It is treated as a booth in all ways, and if it had not, somehow, a great spirit of solemnity within it, the traveler would soon have

pose, in a position to judge; but there is no doubt that, if a necessity it be, it is a deeply regrettable one. To no more distressing necessity have people of taste lately had to resign themselves. Wherever the hand of the restorer has been laid, all semblance of beauty has vanished, which is a sad fact, considering that the external loveliness of St. Mark's has been for ages less impressive only than that of the still comparatively uninjured interior. I know not what is the measure of necessity in such a case, and it appears indeed to be a very delicate question. To-day, at any rate, that admirable harmony of faded mosaic and marble, which, to the eye of the traveler emerging from the narrow streets that lead to the Piazza, filled all the farther end of it with a sort of dazzling, silvery presence,—to-day this lovely vision is in a way to be completely reformed, and, indeed, well-nigh abolished. The old softness and mellowness of color,—the work of the quiet centuries and of the breath of the salt sea,—is giving way to large, crude patches of new material, which

have the effect of a monstrous malady rather than of a restoration to health. They look like blotches of red and white paint and dishonorable smears of chalk on the cheeks of a noble matron. The face toward the Piazzetta is in especial the newest-looking thing conceivable,—as new as a new pair of boots, or as the morning's paper. We do not profess, however, to undertake a scientific quarrel with these changes, and admit that our complaint is a purely sentimental one. The march of industry in united Italy must doubtless be looked at as a whole, and one must endeavor to believe that it is through innumerable lapses of taste that this deeply interesting country is groping her way to her place among the nations. For the present, it is not to be denied, certain odd phases of the process are more visible than the result, to arrive at which it seems necessary that, as she was of old a passionate

votary of the beautiful, she should to-day burn everything that she has adored. It is, doubtless, too soon to

judge her, and there are moments when one is willing to forgive her even the restoration of St. Mark's. Inside, as well, there has been a considerable attempt to make the place more tidy; but the general effect, as yet, has not seriously suffered. What I chiefly remember is the straightening out of that dark and rugged old pavement,—those deep undulations of primitive mosaic, in which the wandering tourist was thought to perceive an intended resemblance to the waves of the ocean. Whether intended or not, the analogy was an image the more in a treasure-house of images; but from a considerable portion of the church it has now disappeared. Throughout the greater part, indeed, the pavement remains as recent generations have known it,—dark, rich, cracked, uneven, spotted with porphyry and time-blackened malachite, and polished by the knees of innumerable worshippers; but in other large sections the idea imitated by the restorers is that of the ocean in a dead calm, and the model they have taken, the floor of a London club-house or of a New York hotel. I think no Venetian and scarcely any Italian cares much for such differences; and when, a year ago, people in England were writing to the "Times" about

THE PIAZZETTA.

DESDEMONA'S HOUSE.

RIALTO BRIDGE, BUILT BY ANTONIO DA PONTE, 1588-91.

the whole business, and holding meetings to protest against it, the dear children of the lagoon (so far as they heard, or heeded, the rumor) thought them partly busy-bodies and partly asses. Busy-bodies they doubtless were, but they took a good deal of disinterested trouble. It never occurs to the Venetian mind of to-day that such trouble may be worth taking; the Venetian mind vainly endeavors to conceive a state of existence in which personal questions are so insipid that people have to look for grievances in the wrongs of brick and marble. I must not, however, speak of St. Mark's as if I had the pretension of giving a description of it, or as if the reader desired one. The reader has been too well served already. It is surely the best-described building in the world. Open the "Stones of Venice," open Théophile Gautier's "Italia," and you will see. These writers take it very seriously, and it is only because there is another way of taking it that I venture to speak of it: the way that offers itself after you have been in Venice a couple of months, and the light is not in the great Square, and you pass in under the pictured porticoes, with a feeling of habit and friendliness, and a desire for something cool and dark. There are moments, after all, when the church is comparatively quiet and empty, when you may

sit there with an easy consciousness of its beauty. From the moment, of course, that you go into an Italian church for any purpose but to say your prayers, or look at the ladies, you rank yourself among the trooping barbarians I just spoke of; you treat the place like an orifice in the peep-show. Still, it is almost a spiritual function,—or, at the worst, an amorous one,—to feed one's eyes on the mighty color that drops from the hollow vaults and thickens the air with its richness. It is all so quiet and sad and faded; and yet it is all so brilliant and living. The strange figures in the mosaic pictures, bending with the curve of niche and vault, stare down through the glowing dimness; and the burnished gold that stands behind them catches the light on its little, uneven cubes. St. Mark's owes nothing of its character to the beauty of proportion or perspective; there is nothing grandly balanced or far-arching; there are no long lines nor triumphs of the perpendicular. The church arches indeed; but it arches like a dusky cavern. Beauty of surface, of tone, of detail, of things near enough to touch and kneel upon and lean against,—it is from this the effect proceeds. In this sort of beauty the place is incredibly rich, and you may go there every day and find afresh some lurking pictorial nook. It is a treasury of bits, as

the painters say ; and there are usually three or four painters, with their easels set up in uncertain equilibrium, on the undulating floor. It is not easy to catch the real complexion of St. Mark's, and these laudable attempts at portraiture are apt to look either lurid or livid. But, if you cannot paint the old loose-looking marble slabs, the great panels of basalt and jasper, the crucifixes, of which the lonely anguish looks deeper in the vertical light, the tabernacles whose open doors disclose a dark Byzantine image, spotted with dull, crooked gems,—if you cannot paint these things, you can at least grow fond of them. You grow fond even of the old benches of red marble, partly worn away by the breeches of many generations, and attached to the base of those wide pilasters, of which the precious plating, delightful in its faded brownness, with a faint gray bloom upon it, bulges and yawns a little with honorable age.

## IV.

EVEN at first, when the vexatious sense of the city of the Doges having been reduced to earning its living as a curiosity-shop was in its keenness, there was a great deal of entertainment to be got from lodging on the Riva degli Schiavoni and looking out at the far-

shimmering lagoon. There was entertainment indeed in simply getting into the place and observing the queer incidents of a Venetian *aménagement*. A great many persons contribute, indirectly, to this undertaking, and it

SAN GIORGIO MAGGIORE.

is surprising how they spring out at you during your novitiate, to remind you that they are bound up in some mysterious manner with the constitution of your little establishment. It was an interesting problem, for instance, to trace the subtle connection existing between the niece of the landlady and the occupancy of the fourth floor. Superficially,

BUCENTAUR, THE STATE BARGE OF VENICE.

A NARROW CANAL.

it was not easily visible, as the young lady in question was a dancer at the Fenice theater—or when that was closed, at the Rossini—and might have been supposed to be absorbed by her professional duties. It proved to be necessary, however, that she should hover about the premises in a velvet jacket and a pair of black kid gloves, with one little, white button; as, also, that she should apply a thick coating of powder to her face, which had a charming, oval, and a sweet, weak expression, like that of most of the Venetian young girls, who, as a general thing (it was not a peculiarity of the landlady's niece), are fond of besmearing themselves with flour. It soon became plain that it is not only the wavy-twinkling lagoon that you behold from a habitation on the Riva; you see a little of everything Venetian. Straight across, before my windows, rose the great pink mass of San Giorgio Maggiore, which, for an ugly

Palladian church, has a success beyond all reason. It is a success of position, of color, of the immense detached Campanile, tipped with a tall, gold angel. I know not whether it is because San Giorgio is so grandly conspicuous, and because it has a great deal of worn, faded-looking brick-work; but for many persons the whole place has a kind of suffusion of rosiness. If we were asked what is the leading color at Venice we should say pink, and yet after all we cannot remember that this elegant tint occurs very often. It is a faint, shimmering, airy, watery pink; the bright sea-light seems to flash with it, and the pale whitish-green of lagoon and canal to drink it in. There is, indeed, in Venice a great deal of very evident brick-work, which is never fresh nor loud in color, but always burnt out, as it were, always exquisitely mild. There are certain little mental pictures that rise before the sentimental tourist at the simple mention, written or

spoken, of the places he has loved. When I hear, when I see, the magical name I have written above these pages, it is not of the great Square that I think, with its strange basilica and its high arcades, nor of the wide mouth of the Grand Canal, with the stately steps and the well-poised dome of the Salute; it is not of the low lagoon, nor the sweet Piazzetta, nor the dark chambers of St. Mark's. I simply see a narrow canal in the heart of the city,—a patch of green water and a surface of pink wall. The gondola moves slowly; it gives a great, smooth swerve, passes under a bridge, and the gondolier's cry, carried over the quiet water, makes a kind of splash in the stillness. A girl is passing over the little bridge, which has an arch like a camel's back,

looking at it from his window, when he is not floating about with that delightful sense of being for the moment a part of it, which any gentleman in a gondola is free to entertain. Venetian windows and balconies are a dreadful lure, and while you rest your elbows on these cushioned ledges the precious hours fly away. But, in truth, Venice is not, in fair weather, a place for concentration of mind. The effort required for sitting down to a writing-table is heroic, and the brightest page of MS. looks dull beside the brilliancy of your *milieu*. All nature beckons you forth, and murmurs to you sophistically that such hours should be devoted to collecting impressions. Afterward, in ugly places, at unprivileged times, you can convert your

MONKS GOING TO THE CHURCH OF SANTA MARIA DELLA SALUTE, ON THE FÊTE OF SANTO ANTONIO.  
(FROM PHOTOGRAPH OF PAINTING BY MISS CLARA MONTALBA.)

with an old shawl on her head, which makes her look charming; you see her against the sky as you float beneath. The pink of the old wall seems to fill the whole place; it sinks even into the opaque water. Over the wall is a garden, out of which the long arm of a white June rose—the roses of Venice are splendid—has flung itself by way of spontaneous ornament. On the other side of this small water-way is a great, shabby façade of gothic windows and balconies,—balconies on which dirty clothes are hung, and under which a cavernous-looking doorway opens from a low flight of slimy water-steps. It is very hot and still, the canal has a queer smell, and the whole place is enchanting. It is poor work, however, talking about the colors of things in Venice. The sentimental tourist is perpetually

impressions into prose. Fortunately for the present prosier, the weather was not always fine; the first month was wet and windy, and it was better to look at the lagoon from an open casement than to respond to the advances of persuasive gondoliers. Even then, however, there was a constant entertainment in the view. It was all cold color, and the steel-gray floor of the lagoon was streaked the wrong way by the wind. Then there were charming, cool intervals, when the churches, the houses, the anchored fishing-boats, the whole gently curving line of the Riva, seemed to be washed with a pearly white. Later, it all turned warm,—warm to the eye as well as to other senses. After the middle of May the whole place was in a glow. The sea took on a thousand shades, but they were

only infinite variations of blue, and those rosy walls I just spoke of began to flush in the thick sunshine. Every patch of color, every yard of weather-stained stucco, every glimpse of nestling garden or daub of sky above a *calle*, began to shine and sparkle,—began, as the painters say, to “compose.” The lagoon was streaked with odd currents, which played across it like huge, smooth finger-marks. The gondolas multiplied and

as you see this movement in profile, in a gondola that passes you,—see, as you recline on your own low cushions, the arching body of the gondolier lifted up against the sky,—it has a kind of nobleness which suggests an image on a Greek frieze. The gondolier at Venice is your very good friend,—if you choose him happily,—and on the quality of the personage depends a good deal that of your impressions. He is a part of your daily life,

HAY-BOATS—SMALL CANAL OFF “CANALE DELLA GIUDECCA.”

spotted it all over; every gondola and every gondolier looking, at a distance, precisely like every other. There is something strange and fascinating in this mysterious impersonality of the gondola. It has an identity when you are in it, but, thanks to their all being of the same size, shape, and color, and of the same deportment and gait, it has none, or as little as possible, as you see it pass before you. From my windows on the Riva there was always the same silhouette,—the long, black, slender skiff lifting its head and throwing it back a little, moving, yet seeming not to move, with the grotesquely graceful figure on the poop. This figure inclines, as may be, more to the graceful or to the grotesque,—standing in the “second position” of the dancing-master, but indulging, from the waist upward, in a freedom of movement which that functionary would deprecate. One may say, as a general thing, that there is something rather awkward in the movement of even the most graceful gondolier, and something graceful in the movement of the most awkward. In the graceful men of course the grace predominates, and nothing can be finer than the large, firm way in which, from their point of vantage, they throw themselves over their tremendous oar. It has the boldness of a plunging bird, and the regularity of a pendulum. Sometimes,

your double, your shadow, your complement. Most people, I think, either like their gondolier or hate him; and if they like him, like him very much. In this case they take an interest in him after his departure; wish him to be sure of employment, speak of him as the gem of gondoliers, and tell their friends to be certain to “secure” him. There is usually no difficulty in securing him; there is nothing elusive or reluctant about a gondolier. They are, for the most part, excellent fellows, and the sentimental tourist must always have a kindness for them. More than the rest of the population, of course, they are the children of Venice; they are associated with its idiosyncrasy, with its safest charm, with its silence, with its melancholy. When I say they are associated with its silence, I should immediately add that they are associated, also, with its sound. Among themselves they are an extraordinary talkative company. They chatter at the *traghetti*, where they always have some sharp point under discussion; they bawl across the canals; they bespeak your commands as you approach; they defy each other from afar. If you happen to have a *traghetto* under your window, you are well aware that they are a vocal race. I should go even further than I went just now, and say that the voice of the gondolier is, in fact,

the sound of Venice. There is scarcely any other, and that, indeed, is part of the interest of the place. There is no noise there save distinctly human noise; no rumbling, no vague uproar, nor rattle of wheels and hoofs. It is all articulate, personal sound. One may say, indeed, that Venice is, emphatically, the city of conversation; people talk all over the place, because there is nothing to interfere with their being heard. Among the populace it is a kind of family party. The still water carries the voice, and good Venetians exchange confidences at a distance of half a mile. It saves a world of trouble, and they don't like trouble. Their delightful garrulous language helps them to make Venetian life an long *conversazione*. This language, with its soft elisions, its odd transpositions, its kindly contempt for consonants and other disagreeables, has in it something peculiarly human and accommodating. If your gondolier had no other merit, he would have the merit that he speaks Venetian. This may rank as a merit, even—some people perhaps would say especially—when you don't understand what he says. But he adds to it other graces which make him an agreeable feature in your life. The price he sets on his services is touchingly small, and he has a happy art of being obsequious, without being, or, at least, without seeming abject. For occasional liberalities he evinces an almost lyrical gratitude. In short, he has delightfully good manners, a merit which he shares, for the most part, with Venetians at large. One grows very fond of these people, and the reason of one's fondness is the frankness and sweetness of their address. That of the Italian people, in general, has much to recommend it; but in the Venetian manner there is something peculiarly ingratiating. One feels that the race is old, that it has a long and rich civilization in its blood, and that if it has not been blessed by fortune, it has, at least, been polished by time. It has not a genius for morality, and, indeed, makes few pretensions in that direction. It scruples not to represent the false as the true, and is liable to confusion in the assignation of property. It is peculiarly susceptible to the tender sentiment, which it cultivates with a graceful disregard of the more rigid formalities. I am not sure that it is very brave, and was not struck with its being very industrious. But it has an unflinching sense of the amenities of life; the poorest Venetian is a natural man of the world. He is better company than persons of his class are apt to be among the nations of industry and virtue—where people are also, sometimes, perceived to lie and steal. He has a great desire to please and to be pleased.

v.

IN this latter point the cold-blooded stranger begins at last to imitate him; he begins to lead a life that is, before all things, good-humored: unless, indeed, he allow himself, like Mr. Ruskin, to be put out of his good-humor by Titian and Tiepolo. The hours he spends among the pictures are his best hours in Venice, and I am ashamed of myself to have written so much of common things when I might have been making festoons of the names of the masters. But, when we have covered our page with such festoons, what more is left to say? When one has said Carpaccio and Bellini, Tintoretto and the Veronese, one has struck a note that must be left to resound at will. Everything has been said about the mighty painters, and it is of little importance to record that one traveler the more has found them to his taste. "Went this morning to the Academy; was very much pleased with Titian's 'Assumption.'" That honest phrase has doubtless been written in many a traveler's diary, and was not indiscreet on the part of its author. But it appeals little to the general reader, and we must, moreover, not expose our deepest feelings. Since I have mentioned Titian's "Assumption," I must say that there are some people who have been less pleased with it than the gentleman we have just imagined. It is one of the possible disappointments of Venice, and you may, if you like, take advantage of your privilege of not caring for it. It imparts a look of great richness to the side of the beautiful room of the Academy on which it hangs; but the same room contains two or three works less known to fame which are equally capable of inspiring a passion. "The 'Annunciation' struck me as coarse and superficial": that was once written in a simple-minded traveler's note-book. At Venice, strange to say, Titian is altogether a disappointment; the city of his adoption is far from containing the best of him. Madrid, Paris, London, Florence, Dresden, Munich,—these are the homes of his greatness. There are other painters who have but a single home, and the greatest of these is Tintoretto. Close beside him sit Carpaccio and Bellini, who make with him the dazzling Venetian trio. Paul Veronese may be seen and measured in other places; he is most splendid in Venice, but he shines in Paris and in Dresden. You may walk out of the noon-day dusk of Trafalgar Square in November, and in one of the chambers of the National Gallery see the family of Darius rustling and pleading and weeping at the feet of Alexander. Alexander is a beautiful young Venetian in crimson

SCALA ANTICA IN THE COURT OF GOLDONI'S HOUSE.

pantaloons, and the picture sends a glow into the cold London twilight. You may sit before it for an hour, and dream you are floating to the water-gate of the Ducal Palace, where a certain old beggar, with one of the handsomest heads in the world—he has sat to a hundred painters for Doges, and for personages more sacred—has a prescriptive right to pretend to pull your gondola to the steps and to hold out a greasy, immemorial cap. But you must go to Venice, in fact, to see the other masters, who form part of your life while you are there, and illuminate your view of the universe. It is difficult to express one's relation to them; for the whole Venetian art-world is so near, so familiar, so much an extension and adjunct of the actual world, that it seems almost invidious to say one owes more to one of them than to another. Nowhere (not even in Holland, where the correspondence between the real aspects and the little polished canvases is so constant and so exquisite) do art and life seem so inter-

fused and, as it were, so consanguineous. All the splendor of light and color, all the Venetian air and the Venetian history, are on the walls and ceilings of the palaces; and all the genius of the masters, all the images and visions they have left upon canvas, seem to tremble in the sunbeams and dance upon the waves. That is the perpetual interest of the place,—that you live in a certain sort of knowledge, as in a rosy cloud. You don't go into the churches and galleries by way of a change from the streets; you go into them because they offer you an exquisite reproduction of the things that surround you. All Venice was both model and painter, and life was so pictorial that art could not help becoming so. With all diminutions, life is pictorial still, and this fact gives an extraordinary freshness to one's perception of the great Venetian works. You judge of them not as a connoisseur, but as a man of the world, and you enjoy them because they are so social and so actual. Perhaps, of all works of art that are equally great, they demand least reflection on the part of the spectator,—they make least of a mystery of being enjoyed. Reflection only confirms your admiration, but it is almost ashamed to show its head. These things speak so frankly and benignantly to the sense that we feel there is reason as well in such an address. But it is hard, as I say, to express all this, and it is painful as well to attempt it—painful, because in the memory of vanished hours, so filled with beauty, the sense of present loss is overwhelming. Exquisite hours, enveloped in light and silence, to have known them once is to have always a terrible standard of enjoyment. Certain lovely mornings of May and June come back with an ineffaceable fairness. Venice is not smothered in flowers at this season, in the manner of Florence and Rome; but the sea and sky themselves seem to blossom and rustle. The gondola waits at the wave-washed steps, and if you are wise you will take your place beside a discriminating companion. Such a companion, in Venice, should, of course, be of the sex that discriminates most finely. An intelligent woman who knows her Venice seems doubly intelligent, and it makes no woman's perceptions less keen to be aware that she cannot help looking graceful as she glides over the waves. The handsome Pasquale, with uplifted oar, awaits your command, knowing, in a general way, from observation of your habits, that your intention is to go to see a picture or two. It perhaps does not immensely matter what picture you choose: the whole affair is so charming. It is charming to wander through the light and shade of intricate canals, with perpetual

STATUE OF COLLEONI, BY VERROCCHIO. (IN THE CAMPO DI S. ZANIPOLO.)

architecture above you and perpetual fluidity beneath. It is charming to disembark at the polished steps of a little empty *campo*—a sunny, shabby square, with an old well in the middle, an old church on one side, and tall Venetian windows looking down. Sometimes the windows are tenantless; sometimes a lady

Baptism of Christ, by Cima, which, I believe has been more or less repainted. You can make the thing out in spots; you can see that it has a fullness of perfection. But you turn away from it with a stiff neck, and promise yourself consolation in the Academy and at the Madonna dell' Orto, where two

in a faded dressing-gown is leaning vaguely on the sill. There is always an old man holding out his hat for coppers; there are always three or four small boys dodging possible umbrella-pokes while they precede you, in the manner of custodians, to the door of the church.

#### VI.

THE churches of Venice are rich in pictures, and many a masterpiece lurks in the unaccommodating gloom of side-chapels and sacristies. Many a noble work is perched behind the dusty candles and muslin roses of a scantily visited altar; some of them, indeed, are hidden behind the altar, in a darkness that can never be explored. The facilities offered you for approaching the picture, in such cases, are a kind of mockery of your irritated desire. You stand on tip-toe on a three-legged stool, you climb a rickety ladder, you almost mount upon the shoulders of the *custode*. You do everything but see the picture. You see just enough to perceive that it is beautiful. You catch a glimpse of a divine head, of a fig-tree against a mellow sky; but the rest is impenetrable mystery. You renounce all hope, for instance, of approaching the magnificent Cima le Conegliano in San Giovanni in Bragora; and bethinking yourself of the immaculate purity that dwells in the works of this master, you renounce it with chagrin and pain. Behind the high altar, in that church, there hangs a

noble picture, by the same hand,—pictures as clear as a summer twilight,—present themselves in better circumstances. It may be said, as a general thing, that you never see Tintoretto. You admire him, you adore him, you think him the greatest of painters, but, in the great majority of cases, you don't see him. This is partly his own fault: so many of his works have turned to blackness, and are positively rotting in their frames. At the Scuola di San Rocco, where there are acres of Tintoretto's, there is scarcely anything at all adequately visible, save the immense "Crucifixion" in the upper story. It is true that in looking at this huge composition you look at many pictures; it has not only a multitude of figures, but a wealth of episodes; and you pass from one of these to the other, as if you were "doing" a gallery. Surely, no single picture in the world contains more of human life; there is everything in it, including the most exquisite beauty. It is one of the greatest things of art; it is always interesting. There are pictures by Tintoretto which contain touches more exquisite, revelations of beauty more radiant, but there is no other such vision of an intense reality and a splendid execution. The interest, the impressiveness, of that whole corner of Venice, however melancholy the charm of these gorgeous and ill-lighted chambers, gives a strange importance to a visit to the Scuola. Nothing that all travelers go to see appears to suffer less from the incursions

of travelers. It is one of the loveliest booths of the bazaar, and the author of these lines has always had the good fortune, which he wishes to every other traveler, of having it to himself. I think most visitors find the place rather alarming and wicked-looking. They walk about a while among the fitful figures that gleam here and there out of the great tapestry (as it were) with which Tintoretto has hung all the walls, and then, depressed and bewildered by the portentous solemnity of these objects, by strange glimpses of unnatural scenes, by the echo of their lonely footsteps on the vast stone floors, they take a hasty departure, and find themselves again, with a sense of release from danger, and of the *genius loci* having been a sort of mad white-washer who worked with a bad mixture, in the bright light of the *campo*, among the beggars, the orange-venders, and the passing gondolas. Solemn, indeed, is the place, solemn and strangely suggestive, for the simple reason that we shall scarcely find four walls elsewhere that inclose within a like area an equal quantity of genius. The air is thick with it, and dense and difficult to breathe; for it was genius that was not happy, inasmuch as it lacked the art to fix itself for ever. It is not immortality that we breathe at the Scuola di San Rocco, but conscious, reluctant mortality. Fortunately, however, we have the Ducal Palace, where everything is so brilliant and splendid that poor, dusky Tintoretto is lifted in spite of himself into the concert. This deeply original building is, of course, the loveliest thing in Venice, and a morning's stroll there is a wonderful illumination. Cunningly select your hour—half the enjoyment of Venice is a question of dodging—and go at about one o'clock, when the tourists have gone to lunch and the echoes of the charming chambers have gone to sleep among the sunbeams; there is no brighter place in Venice, by which I mean that, on the whole, there is none half so bright. The reflected sunshine plays up through the great windows from the glittering lagoon, and shimmers and twinkles over gilded walls and ceilings. All the history of Venice, all its splendid, stately past, glows around you in a strong sea-light. Every one here is magnificent, but the great Veronese is the most magnificent of all. He swims before you in a silver cloud; he thrives in an eternal morning. The deep blue sky burns behind him, streaked across with milky bars; the white colonnades sustain the richest canopies, under which the first gentlemen and ladies in the world both render homage and receive it. Their glorious garments rustle in the air of the sea, and their sun-lighted faces are the very complexion of Venice. The mixture of

pride and piety, of politics and religion, of art and patriotism, gives a magnificent dignity to every scene. Never was a painter more nobly joyous, never did an artist take a greater delight in life, seeing it all as a kind of breezy festival and feeling it through the medium of perpetual success. He revels in the gold-framed ovals of the ceilings, with the fluttering movement of an embroidered banner that tosses itself into the blue. He was the happiest of painters, and he produced the happiest picture in the world. The "Rape of Europa" hardly deserves this title; it is impossible to look at it without aching with envy. Nowhere else in art is such a temperament revealed; never did inclination and opportunity combine to express such enjoyment. The mixture of flowers and gems and brocade, of blooming flesh and shining sea and waving groves, of youth, health, movement, desire,—all this is the brightest vision that ever descended upon the soul of a painter. Happy the artist who could entertain such a vision; happy the artist who could paint it as the "Rape of Europa" is painted. Tintoretto's visions were not so bright as that; but he had several that were radiant enough. In the room that contains the "Rape of Europa" are several smaller canvases by the greatly more complex genius of the Scuola di San Rocco, which are almost simple in their loveliness, almost happy in their simplicity. They have kept their brightness through the centuries, and they shine with their neighbors in those golden rooms. There is a piece of painting in one of them which is one of the sweetest things in Venice, and which reminds one afresh of those wild flowers of execution that bloom so profusely and so unheeded in the dark corners of all of Tintoretto's work. "Pallas chasing away Mars" is, I believe, the name that is given to the picture; and it represents in fact a young woman of noble appearance, administering a gentle push, to a fine young man in armor, as if to tell him to keep his distance. It is of the gentleness of this push that I speak, the charming way in which she puts out her arm, with a single bracelet on it, and rests her young hand, with its rosy fingers parted, upon his dark breast-plate. She bends her enchanting head with the effort,—a head which has all the strange fairness that Tintoretto always sees in women,—and the soft, living, flesh-like glow of all those members, over which the brush has scarcely paused in its course, is as pretty an example of genius as all Venice can show. But why speak of Tintoretto when I can say nothing of the great "Paradise," which unfolds its somewhat smoky splendor, and the won-

THE DUCAL PALACE.

der of its multitudinous circles, in one of the other chambers? If it were not one of the first pictures in the world, it would be about the biggest, and it must be confessed that at first the spectator gets from it chiefly an impression of quantity. Then he sees that this quantity is really wealth; that the dim confusion of faces is a magnificent composition, and that some of the details of this composition are supremely beautiful. It is impossible, however, in a retrospect of Venice, to specify one's happiest hours, though, as one looks backward, certain ineffaceable moments start here and there into vividness. How is it possible to forget one's visits to the sacristy of the Frari, however frequent they may have been, and the great work of John Bellini which forms the treasure of that apartment?

## VII.

NOTHING in Venice is more perfect than this, and we know of no work of art more complete. The picture is in three compartments: the Virgin sits in the central division with her child; two venerable saints, standing close together, occupy each of the others. It is impossible to imagine anything more finished or more ripe. It is one of those things that sums up the genius of a painter, the experience of a life, the teaching of a school. It seems painted with molten gems, which have only been clarified by time, and it is as solemn as it is gorgeous, and as simple

as it is deep. John Bellini is, more or less, everywhere in Venice, and wherever he is, he is almost certain to be first—first, I mean, in his own line; he paints little else than the Madonna and the saints; he has not Carpaccio's care for human life at large, nor Tintoretto's, nor that of the Veronese. Some of his greater pictures, however, where several figures are clustered together, have a richness of sanctity that is almost profane. There is one of them on the dark side of the room at the Academy, containing Titian's "Assumption," which, if we could only see it,—its position is an inconceivable scandal,—would evidently be one of the mightiest of so-called sacred pictures. So, too, is the Madonna of San Zaccaria, hung in a cold, dim, dreary place, ever so much too high, but so mild and serene, and so grandly disposed and accompanied, that the proper attitude for even the most critical amateur, as he looks at it, seems to be the bended knee. There is another noble John Bellini, one of the very few in which there is no Virgin, at San Giovanni Crisostomo,—a St. Jerome, in a red dress, sitting aloft upon the rocks, with a landscape of extraordinary purity behind him. The absence of the peculiarly erect Madonna makes it an interesting surprise among the works of the painter, and gives it a somewhat less strenuous air. But it has brilliant beauty, and the St. Jerome is a delightful old personage. The same church contains another great picture, for which he must find a shrine apart in his

memory ; one of the most interesting things he will have seen, if not the most brilliant. Nothing appeals more to him than three figures of Venetian ladies which occupy the foreground of a smallish canvas of Sebastian del Piombo, placed above the high altar of San Giovanni Crisostomo. Sebastian was a Venetian by birth, but few of his productions are to be seen in his native place ; few, indeed, are to

cure that she is gentle, and so quiet that, in comparison, all minor assumptions of calmness suggest only a vulgar alarm. But, for all this, there are depths of possible disorder in her light-colored eye. I had meant, however, to say nothing about her, for it is not right to speak of Sebastian when one has not found room for Carpaccio. These visions come to one, and one can neither hold them nor brush

A MEMORY OF VENICE.

be seen anywhere. The picture represents the patron saint of the church, accompanied by other saints, and by the worldly votaries I have mentioned. These ladies stand together on the left, holding in their hands little white caskets ; two of them are in profile, but the foremost turns her face to the spectator. This face and figure are almost unique among the beautiful things of Venice, and they leave the susceptible observer with the impression of having made, or rather having missed, a strange, a dangerous, but a most valuable, acquaintance. The lady, who is superbly handsome, is the typical Venetian of the sixteenth century, and she remains in the mind as the perfect flower of that society. Never was there a greater air of breeding, a deeper expression of tranquil superiority. She walks like a goddess—as if she trod, without sinking, the waves of the Adriatic. It is impossible to conceive a more perfect expression of the aristocratic spirit, either in its pride or in its benignity. This magnificent creature is so strong and se-

them aside. Memories of Carpaccio, the magnificent, the delightful—it is not for want of such visitations, but only for want of space, that I have not said of him what I would. There is little enough need of it for Carpaccio's sake, his fame being brighter to-day—thanks to the generous lamp Mr. Ruskin has held up to it—than it has ever been. Yet there is something ridiculous in talking of Venice without making him, almost, the refrain. He and Tintoretto are the two great realists, and it is hard to say which is the more human, the more various. Tintoretto had the mightier temperament, but Carpaccio, who had the advantage of more newness and more responsibility, sailed nearer to perfection. Here and there he quite touches it, as in the enchanting picture, at the Academy, of St. Ursula asleep in her little white bed, in her high, clean room, where the angel visits her at dawn ; or in the noble St. Jerome in his study, at S. Giorgio degli Schiavoni. This latter work is a pearl of sentiment, and I may add, without being

A CANAL IN VENICE. (FROM THE PAINTING BY D. MARTIN RICO. BY PERMISSION OF GEO. BARRIE, ESQ.)

fantastic, a ruby of color. It unites the most masterly finish with a kind of universal largeness of feeling, and he who has it well in his memory will never hear the name of Carpaccio without a throb of almost personal affection. This, indeed, is the feeling that descends upon you in that wonderful little chapel of St. George of the Slaves, where this most personal and sociable of artists has expressed all the sweetness of his imagination. The place is small and incommensurable, the pictures are out of sight and ill-lighted, the custodian is rapacious, the visitors are mutually intolerable, but the shabby little chapel is a palace of art. Mr. Ruskin has written a pamphlet about it which is a real

aid to enjoyment, though I cannot but think the generous artist, with his keen senses and his just feeling, would have suffered at hearing his eulogist declare that one of his other productions—in the Museo Civico in Palazzo Correr, a delightful portrait of two Venetian ladies, with pet animals—is the “finest picture in the world.” It has no need of that to be thought admirable; and what more can a painter desire?

#### VIII.

MAY in Venice is better than April, but June is best of all. Then the days are hot, but not too hot, and the nights are more

beautiful than the days. Then Venice is rosier than ever in the morning, and more golden than ever as the day descends. It seems to expand and evaporate, to multiply all its reflections and iridescences. Then the life of its people and the strangeness of its constitution becomes a perpetual comedy, or, at least, a perpetual drama. Then the gondola becomes your habitation, and you spend days between sea and sky. You go to the Lido, though the Lido has been spoiled. When I was first in Venice, in 1869, it was a very natural place, and there was only a rough lane across the little island, from the landing-place to the beach. There was a bathing-place in those days, and a restaurant, which was very bad, but where, in the warm evenings, your dinner did not much matter as you sat letting it cool upon the wooden terrace that stretched out into the sea. To-day the Lido is a part of United Italy, and has been made the victim of villainous improvements. A little cockney village has sprung up in its rural bosom, and a third-rate Boulevard leads from Santa Elisabetta to the Adriatic. There are bitumen walls and gas-lamps, lodging-houses, shops, and a day theater. The bathing establishment is bigger than before, and the restaurant as well; but it is a compensation, perhaps, that the cuisine is no better. Such as it is, however, you will not scorn occasionally to partake of it on the breezy platform under which bathers dart and splash, and which looks out to where the fishing-boats, with sails of orange and crimson, wander along the darkening horizon. The beach at the Lido is still lovely and beautiful, and you can easily walk away from the cockney village. The return to Venice in the sunset is classical and indispensable, and those who, at that glowing hour, have floated toward the towers that rise out of the lagoon, will not easily part with the impression. But you indulge in larger excursions—you go to Burano and Torcello, to Malamocco and Chioggia. Torcello, like the Lido, has been improved; the deeply interesting little cathedral of the eighth century, which stood there on the edge of the sea, as touching in its ruin, with its grassy threshold and its primitive mosaics, as the bleached bones of a human skeleton washed ashore by the tide, has now been restored and made cheerful, and the charm of the place, its strange and suggestive desolation, has well-nigh departed. It will still serve you as a pretext, however, for a day on the lagoon, especially as you will disembark at Burano and admire the wonderful fisher-folk, whose

good looks—and bad manners, I am sorry to say—can scarcely be exaggerated. Burano is celebrated for the beauty of its women and the rapacity of its children, and it is a fact that though some of the ladies are rather bold about it, every one of them shows you a handsome face. The children assail you for coppers, and, in their desire to be satisfied, pursue your gondola into the sea. Chioggia is a larger Burano, and you carry away from either place a half-sad, half-cynical, but altogether pictorial impression; the impression of bright-colored hovels, of bathing in stagnant canals, of young girls with faces of a delicate shape and a susceptible expression, with splendid heads of hair, and complexions smeared with powder, faded yellow shawls that hang like old Greek draperies, and little wooden shoes that click as they go up and down the steps of the convex bridges; of brown-cheeked matrons with lustrous tresses and high tempers, massive throats encased with gold beads, and eyes that meet your own with a certain traditional defiance. The men throughout the islands of Venice are almost as handsome as the women; I have never seen so many good-looking fellows. At Burano and Chioggia they sit mending their nets, or lounge at the street-corners, where conversation is always high-pitched, or clamor to you to take a boat; and everywhere they decorate the scene with their splendid color—cheeks and throats as richly brown as the sails of their fishing-smacks—their sea-faded tatters, which are always a “costume”—their soft Venetian jargon, and the gallantry with which they wear their hats—an article that nowhere sits so well as on a mass of dense Venetian curls. If you are happy, you will find yourself, after a June day in Venice (about ten o'clock), on a balcony that overhangs the Grand Canal, with your elbows on the broad ledge, a cigarette in your teeth, and a little good company beside you. The gondolas pass beneath, the watery surface gleams here and there from their lamps, some of which are colored lanterns that move mysteriously in the darkness. There are some evenings in June when there are too many gondolas, too many lanterns, too many serenades in front of the hotels. The serenading (in particular) is overdone; but on such a balcony as I speak of you needn't suffer from it, for in the apartment behind you,—an accessible refuge,—there is more good company, there are more cigarettes. If you are wise you will step back there presently.

*Henry James, Jr.*

*H. Smith*

## HENRY JAMES, JR.

THE events of Mr. James's life—as we agree to understand events—may be told in a very few words. His race is Irish on his father's side and Scotch on his mother's, to which mingled strains the generalizer may attribute, if he likes, that union of vivid expression and dispassionate analysis which has characterized his work from the first. There are none of those early struggles with poverty, which render the lives of so many distinguished Americans monotonous reading, to record in his case: the cabin hearth-fire did not light him to the youthful pursuit of literature; he had from the start all those advantages which, when they go too far, become limitations.

He was born in New York city in the year 1843, and his first lessons in life and letters were the best which the metropolis—so small in the perspective diminishing to that date—could afford. In his twelfth year his family went abroad, and after some stay in England made a long sojourn in France and Switzerland. They returned to America in 1860, placing themselves at Newport, and for a year or two Mr. James was at the Harvard Law School, where, perhaps, he did not study a great deal of law. His father removed from Newport to Cambridge in 1866, and there Mr. James remained till he went abroad, three years later, for the residence in England and Italy which, with infrequent visits home, has continued ever since.

It was during these three years of his Cambridge life that I became acquainted with his work. He had already printed a tale—"The Story of a Year"—in the "Atlantic Monthly," when I was asked to be Mr. Fields's assistant in the management, and it was my fortune to read Mr. James's second contribution in manuscript. "Would you take it?" asked my chief. "Yes, and all the stories you can get from the writer." One is much securer of one's judgment at twenty-nine than, say, at forty-five; but if this was a mistake of mine I am not yet old enough to regret it. The story was called "Poor Richard," and it dealt with the conscience of a man very much in love with a woman who loved his rival. He told this rival a lie, which sent him away to his death on the field,—in that day nearly every fictitious personage had something to do with the war,—but Poor Richard's lie did not win him his love. It still seems to me that the situation was strongly and finely felt. One's

pity went, as it should, with the liar; but the whole story had a pathos which lingers in my mind equally with a sense of the new literary qualities which gave me such delight in it. I admired, as we must in all that Mr. James has written, the finished workmanship in which there is no loss of vigor; the luminous and uncommon use of words, the originality of phrase, the whole clear and beautiful style, which I confess I weakly liked the better for the occasional gallicisms remaining from an inveterate habit of French. Those who know the writings of Mr. Henry James will recognize the inherited felicity of diction which is so striking in the writings of Mr. Henry James, Jr. The son's diction is not so racy as the father's; it lacks its daring, but it is as fortunate and graphic; and I cannot give it greater praise than this, though it has, when he will, a splendor and state which is wholly its own.

Mr. James is now so universally recognized that I shall seem to be making an unwarrantable claim when I express my belief that the popularity of his stories was once largely confined to Mr. Fields's assistant. They had characteristics which forbade any editor to refuse them; and there are no anecdotes of thrice-rejected manuscripts finally printed to tell of him; his work was at once successful with all the magazines. But with the readers of "The Atlantic," of "Harper's," of "Lippincott's," of "The Galaxy," of "The Century," it was another affair. The flavor was so strange, that, with rare exceptions, they had to "learn to like" it. Probably few writers have in the same degree compelled the liking of their readers. He was reluctantly accepted, partly through a mistake as to his attitude—through the confusion of his point of view with his private opinion—in the reader's mind. This confusion caused the tears of rage which bedewed our continent in behalf of the "average American girl" supposed to be satirized in Daisy Miller, and prevented the perception of the fact that, so far as the average American girl was studied at all in Daisy Miller, her indestructible innocence, her invulnerable new-worldliness, had never been so delicately appreciated. It was so plain that Mr. James disliked her vulgar conditions, that the very people to whom he revealed her essential sweetness and light were furious that he should have seemed not to see what existed through him. In other

words, they would have liked him better if he had been a worse artist—if he had been a little more confidential.

But that artistic impartiality which puzzled so many in the treatment of Daisy Miller is one of the qualities most valuable in the eyes of those who care how things are done, and I am not sure that it is not Mr. James's most characteristic quality. As "frost performs the effect of fire," this impartiality comes at last to the same result as sympathy. We may be quite sure that Mr. James does not like the peculiar phase of our civilization typified in Henrietta Stackpole; but he treats her with such exquisite justice that he lets *us* like her. It is an extreme case, but I confidently allege it in proof.

His impartiality is part of the reserve with which he works in most respects, and which at first glance makes us say that he is wanting in humor. But I feel pretty certain that Mr. James has not been able to disinherit himself to this degree. We Americans are terribly in earnest about making ourselves, individually and collectively; but I fancy that our prevailing mood in the face of all problems is that of an abiding faith which can afford to be funny. He has himself indicated that we have, as a nation, as a people, our joke, and every one of us is in the joke more or less. We may, some of us, dislike it extremely, disapprove it wholly, and even abhor it, but we are in the joke all the same, and no one of us is safe from becoming the great American humorist at any given moment. The danger is not apparent in Mr. James's case, and I confess that I read him with a relief in the comparative immunity that he affords from the national facetiousness. Many of his people are humorously imagined, or rather humorously *seen*, like Daisy Miller's mother, but these do not give a dominant color; the business in hand is commonly serious, and the droll people are subordinated. They abound, nevertheless, and many of them are perfectly new finds, like Mr. Tristram in "The American," the bill-paying father in the "Pension Beaurepas," the anxiously Europeanizing mother in the same story, the amusing little Madame de Belgarde, Henrietta Stackpole, and even Newman himself. But though Mr. James portrays the humorous in character, he is decidedly not on humorous terms with his reader; he ignores rather than recognizes the fact that they are both in the joke.

If we take him at all we must take him on his own ground, for clearly he will not come to ours. We must make concessions to him, not in this respect only, but in several others, chief among which is the motive for

reading fiction. By example, at least, he teaches that it is the pursuit and not the end which should give us pleasure; for he often prefers to leave us to our own conjectures in regard to the fate of the people in whom he has interested us. There is no question, of course, but he could tell the story of Isabel in "The Portrait of a Lady" to the end, yet he does not tell it. We must agree, then, to take what seems a fragment instead of a whole, and to find, when we can, a name for this new kind in fiction. Evidently it is the character, not the fate, of his people which occupies him; when he has fully developed their character he leaves them to what destiny the reader pleases.

The analytic tendency seems to have increased with him as his work has gone on. Some of the earlier tales were very dramatic: "A Passionate Pilgrim," which I should rank above all his other short stories, and for certain rich poetical qualities, above everything else that he has done, is eminently dramatic. But I do not find much that I should call dramatic in "The Portrait of a Lady," while I do find in it an amount of analysis which I should call superabundance if it were not all such good literature. The novelist's main business is to possess his reader with a due conception of his characters and the situations in which they find themselves. If he does more or less than this he equally fails. I have sometimes thought that Mr. James's danger was to do more, but when I have been ready to declare this excess an error of his method I have hesitated. Could anything be superfluous that had given me so much pleasure as I read? Certainly from only one point of view, and this a rather narrow, technical one. It seems to me that an enlightened criticism will recognize in Mr. James's fiction a metaphysical genius working to æsthetic results, and will not be disposed to deny it any method it chooses to employ. No other novelist, except George Eliot, has dealt so largely in analysis of motive, has so fully explained and commented upon the springs of action in the persons of the drama, both before and after the facts. These novelists are more alike than any others in their processes, but with George Eliot an ethical purpose is dominant, and with Mr. James an artistic purpose. I do not know just how it should be stated of two such noble and generous types of character as Dorothea and Isabel Archer, but I think that we sympathize with the former in grand aims that chiefly concern others, and with the latter in beautiful dreams that primarily concern herself. Both are unselfish and devoted women, sublimely true to a mistaken ideal in their marriages; but,

though they come to this common martyrdom, the original difference in them remains. Isabel has her great weaknesses, as Dorothea had, but these seem to me, on the whole, the most nobly imagined and the most nobly intentioned women in modern fiction; and I think Isabel is the more subtly divined of the two. If we speak of mere characterization, we must not fail to acknowledge the perfection of Gilbert Osmond. It was a profound stroke to make him an American by birth. No European could realize so fully in his own life the ideal of a European *dilettante* in all the meaning of that cheapened word; as no European could so deeply and tenderly feel the sweetness and loveliness of the English past as the sick American, Searle, in "The Passionate Pilgrim."

What is called the international novel is popularly dated from the publication of "Daisy Miller," though "Roderick Hudson" and "The American" had gone before; but it really began in the beautiful story which I have just named. Mr. James, who invented this species in fiction, first contrasted in the "Passionate Pilgrim" the New World and Old World moods, ideals, and prejudices, and he did it there with a richness of poetic effect which he has since never equalled. I own that I regret the loss of the poetry, but you cannot ask a man to keep on being a poet for you; it is hardly for him to choose; yet I compare rather discontentedly in my own mind such impassioned creations as Searle and the painter in "The Madonna of the Future" with "Daisy Miller," of whose slight, thin personality I also feel the indefinable charm, and of the tragedy of whose innocence I recognize the delicate pathos. Looking back to those early stories, where Mr. James stood at the dividing ways of the novel and the romance, I am sometimes sorry that he declared even superficially for the former. His best efforts seem to me those of romance; his best types have an ideal development, like Isabel and Claire Belgarde and Bessy Alden and poor Daisy and even Newman. But, doubtless, he has chosen wisely; perhaps the romance is an outworn form, and would not lend itself to the reproduction of even the ideality of modern life. I myself waver somewhat in my preference—if it is a preference—when I think of such people as Lord Warburton and the Touchetts, whom I take to be all decidedly of this world. The first of these especially interested me as a probable type of the English nobleman, who amiably accepts the existing situation with all its possibilities of political and social change, and insists not at all upon the surviving feudalities, but means to be a

manly and simple gentleman in any event. An American is not able to pronounce as to the verity of the type; I only know that it seems probable and that it is charming. It makes one wish that it were in Mr. James's way to paint in some story the present phase of change in England. A titled personage is still mainly an inconceivable being to us; he is like a goblin or a fairy in a story-book. How does he comport himself in the face of all the changes and modifications that have taken place and that still impend? We can hardly imagine a lord taking his nobility seriously; it is some hint of the conditional frame of Lord Warburton's mind that makes him imaginable and delightful to us.

It is not my purpose here to review any of Mr. James's books; I like better to speak of his people than of the conduct of his novels, and I wish to recognize the fineness with which he has touched-in the pretty primness of Osmond's daughter and the mild devotedness of Mr. Rosier. A masterly hand is as often manifest in the treatment of such subordinate figures as in that of the principal persons, and Mr. James does them unerringly. This is felt in the more important character of Valentin Belgarde, a fascinating character in spite of its defects,—perhaps on account of them—and a sort of French Lord Warburton, but wittier, and not so good. "These are my ideas," says his sister-in-law, at the end of a number of inanities. "Ah, you call them ideas!" he returns, which is delicious and makes you love him. He, too, has his moments of misgiving, apparently in regard to his nobility, and his acceptance of Newman on the basis of something like "manhood suffrage" is very charming. It is of course difficult for a remote plebeian to verify the pictures of legitimist society in "The American," but there is the probable suggestion in them of conditions and principles, and want of principles, of which we get glimpses in our travels abroad; at any rate, they reveal another and not impossible world, and it is fine to have Newman discover that the opinions and criticisms of our world are so absolutely valueless in that sphere that his knowledge of the infamous crime of the mother and brother of his betrothed will have no effect whatever upon them in their own circle if he explodes it there. This seems like aristocracy indeed! and one admires, almost respects, its survival in our day. But I always regretted that Newman's discovery seemed the precursor of his magnanimous resolution not to avenge himself; it weakened the effect of this, with which it had really nothing to do. Upon the whole, however, Newman is an adequate and satisfying representative of Americanism, with

his generous matrimonial ambition, his vast good-nature, and his thorough good sense and right feeling. We must be very hard to please if we are not pleased with him. He is not the "cultivated American" who redeems us from time to time in the eyes of Europe; but he is unquestionably more national, and it is observable that his unaffected fellow-countrymen and women fare very well at Mr. James's hands always; it is the Europeanizing sort like the critical little Bostonian in the "Bundle of Letters," the ladies shocked at Daisy Miller, the mother in the "Pension Beaurepas" who goes about trying to be of the "native" world everywhere, Madame Merle and Gilbert Osmond, Miss Light and her mother, who have reason to complain, if any one has. Doubtless Mr. James does not mean to satirize such Americans, but it is interesting to note how they strike such a keen observer. We are certainly not allowed to like them, and the other sort find somehow a place in our affections along with his good Europeans. It is a little odd, by the way, that in all the printed talk about Mr. James—and there has been no end of it—his power of engaging your preference for certain of his people has been so little commented on. Perhaps it is because he makes no obvious appeal for them; but one likes such men as Lord Warburton, Newman, Valentin, the artistic brother in "The Europeans," and Ralph Touchett, and such women as Isabel, Claire Belgarde, Mrs. Tristram, and certain others, with a thoroughness that is one of the best testimonies to their vitality. This comes about through their own qualities, and is not affected by insinuation or by downright *petting*, such as we find in Dickens nearly always and in Thackeray too often.

The art of fiction has, in fact, become a finer art in our day than it was with Dickens and Thackeray. We could not suffer the confidential attitude of the latter now, nor the mannerism of the former, any more than we could endure the prolixity of Richardson or the coarseness of Fielding. These great men are of the past—they and their methods and interests; even Trollope and Reade are not of the present. The new school derives from Hawthorne and George Eliot rather than any others; but it studies human nature much more in its wonted aspects, and finds its ethical and dramatic examples in the operation of lighter but not really less vital motives. The moving accident is certainly not its trade; and it prefers to avoid all manner of dire catastrophes. It is largely influenced by French fiction in form; but it is the realism of Daudet rather than the realism of Zola

that prevails with it, and it has a soul of its own which is above the business of recording the rather brutish pursuit of a woman by a man, which seems to be the chief end of the French novelist. This school, which is so largely of the future as well as the present, finds its chief exemplar in Mr. James; it is he who is shaping and directing American fiction, at least. It is the ambition of the younger contributors to write like him; he has his following more distinctly recognizable than that of any other English-writing novelist. Whether he will so far control this following as to decide the nature of the novel with us remains to be seen. Will the reader be content to accept a novel which is an analytic study rather than a story, which is apt to leave him arbiter of the destiny of the author's creations? Will he find his account in the unflagging interest of their development? Mr. James's growing popularity seems to suggest that this may be the case; but the work of Mr. James's imitators will have much to do with the final result.

In the meantime it is not surprising that he has his imitators. Whatever exceptions we take to his methods or his results, we cannot deny him a very great literary genius. To me there is a perpetual delight in his way of saying things, and I cannot wonder that younger men try to catch the trick of it. The disappointing thing for them is that it is not a trick, but an inherent virtue. His style is, upon the whole, better than that of any other novelist I know; it is always easy, without being trivial, and it is often stately, without being stiff; it gives a charm to everything he writes; and he has written so much and in such various directions, that we should be judging him very incompletely if we considered him only as a novelist. His book of European sketches must rank him with the most enlightened and agreeable travelers; and it might be fitly supplemented from his uncollected papers with a volume of American sketches. In his essays on modern French writers he indicates his critical range and grasp; but he scarcely does more, as his criticisms in "The Atlantic" and "The Nation" and elsewhere could abundantly testify.

There are indeed those who insist that criticism is his true vocation, and are impatient of his devotion to fiction; but I suspect that these admirers are mistaken. A novelist he is not, after the old fashion, or after any fashion but his own; yet since he has finally made his public in his own way of storytelling—or call it character-painting if you prefer,—it must be conceded that he has chosen best for himself and his readers in choosing the form of fiction for what he has to say. It is,

after all, what a writer has to say rather than what he has to tell that we care for nowadays. In one manner or other the stories were all told long ago; and now we want merely to know what the novelist thinks about persons and situations. Mr. James gratifies this philosophic desire. If he sometimes forbears to tell us what he thinks of the last state of his people, it is perhaps because that does not interest him, and a large-minded criticism might well insist that it was childish to demand that it must interest him.

I am not sure that my criticism is suf-

ficiently large-minded for this. I own that I like a finished story; but then also I like those which Mr. James seems not to finish. This is probably the position of most of his readers, who cannot very logically account for either preference. We can only make sure that we have here an annalist, or analyst, as we choose, who fascinates us from his first page to his last, whose narrative or whose comment may enter into any minuteness of detail without fatiguing us, and can only truly grieve us when it ceases.

---

### FAITH'S FORTITUDE.

WITH but a sail and bank of fragile oars,  
And only stars to guide their aimless aim,  
The ancient Northmen crossed the seas, and came  
Triumphant to our sunny unknown shores.

It was the legends of these dauntless rowers—  
Vague legends, giving no man place or name—  
Which kindled in Columbus' breast, like flame,  
His dream of western lands of boundless stores.  
Such ocean lies around our little life,  
Trackless, and deeper than our fathoms run;  
We, brave, launch out, and steer by sails or sun:  
Of fiercest storms we take the brunt and strife;  
To later voyagers our wrecks are rife  
With good, long after all our pain is done.

The ignorant Sepoy soldiers, when they saw  
The pontoon bridges tossing frail and light  
Upon deep waters rushing swift and white,  
Marched on them, tranquil, with no doubting awe:  
Their faith and fine obedience had no flaw.  
But, halting, terror-stricken at the sight,  
The elephants, immovable from fright,  
Refused to cross. By dull material law  
Their clumsy instinct reckoned and was bound.  
They would not trust what they had never tried.  
So faith, to calm obedience allied,  
Transports our souls triumphant over ground  
Where reason halts; across abysses wide  
And deep, which reason cannot span nor sound.

Our selfish hearts rebel and chafe at this,  
And take a specious refuge in pretense  
Of comprehending God's omnipotence.  
Our one sure safety we reject and miss,  
When once we make our good the test of His.  
His final ends surpass our feeble sense;  
His plan is greater than our preference;  
Who told us we had any right to bliss?  
Our tears are but our arrogant conceit.  
Two things that grow and yield the sweetest sweet,  
The lofty cocoa-palm, and sugar-cane,  
As well on waters salt as on fresh rain  
Will thrive, and in their sap and fruit complete,  
No lurking taste of bitter will remain.

*H. H.*

## VICTOR HUGO.\*

ALL of my generation—all who have reached the age of forty, have known Hugo from childhood. To Hugo I owe my first emotions. My family then lived at Lyons, which to people of the south of France is a place of exile. Black, foggy, comfortless, it is a dreary home for children who need gayety and sunshine. Our sun was Victor Hugo. My elder brother, having a little pocket-money to spend, invested it in the large illustrated *livraisons* of the poet's works,—the popular edition, with plates, by Beaucé,—and at night, lying in the same bed, we devoured the feast of poesy with the appetite natural to lads twelve years old. Many a time, wrapping the candle in thick paper lest the light should betray us, have we lain awake till dawn to read Victor Hugo. "Are you asleep, children?" Papa Daudet would cry from the next room, and we would be silent, pretending to sleep. When, by and by, we returned to the interrupted reading, our alarm gave zest to the banquet. He who thus charmed us was to us more than human. We murmured the cadence of his cradle-song; we caught the throb, the rhythmic beat of his ballad:

" Par saint Gille!  
Viens nous-en,  
Mon agile  
Alezan;  
Viens, écoute,  
Par la route,  
Voir la joûte  
Du roi Jean . . . "

—and with feverish hand we turned the pages of the "Feuilles d'Automne," the "Chants du Crépuscule," the "Orientales," and all those noble works in whose sonorous names I still feel the magic of old, though less in the words themselves than in the memory of my earliest sensations.

After those nights of poetic enthusiasm came my school days,—the period of formal and wearisome drilling in text-books, rules, and grammars. To understand what I suffered during that epoch one must recall the condition of our provincial schools in 1851. Hugo was still under the ban of the university. I can only remember one professor at Lyons who read us any of the poet's works, and I think of him gratefully still. All the rest considered Hugo's name a synonym for false taste and false style. A professor of rhetoric used to read and ridicule a few passages, a few detached phrases, as an example of

errors that we should avoid. He recited them with absurd emphasis and shook in his chair with laughter. My school-mates were servile enough to join in the merriment, applauding their teacher; for my part I was as sorely wounded by these sarcasms as though they had been directed at myself. Whatever was quoted as false, harsh, or trivial, seemed to me excellent. I heartily approved of it. I had the divine instinct of childhood, the freshness of impression which no university tutor could wrest from me.

In 1857, when I came to Paris, Hugo was in exile. I now had my second revelation of the poet. It was the hour when the "Châtiments" was in everybody's hands. Its sale was forbidden in France, but the Belgian editions passed from friend to friend. Hugo was no longer the poet only; he had become the great citizen—the mouth-piece of the outraged conscience of the nation. This book brought him into our modern life. All our young men, of whom Gambetta was one, knew the "Châtiments" by heart. I can recall Castagnary, who is to-day a Councilor of State, and was then an attorney's clerk,—I can recall him as he declaimed Hugo's verses in a café near the Tuileries, a meeting-place of the body-guard, the armed retainers of the castle. In his waistcoat, with large lappels, à la Robespierre,—made from the velvet of an old arm-chair,—I can see him still, standing on a table and reciting, in his soft and flute-like voice, the strophes of the "Manteau Impérial:"

" Chastes buveuses de rosée,  
Qui, pareilles à l'épousée,  
Visitez le lis du coteau,  
Ô sœurs des corolles vermeilles,  
Filles de la lumière, Abeilles,  
Envolez vous de ce manteau!

Ruez vous sur l'homme, guerrières!  
Ô généreuses ouvrières—  
Aveuglez l'immonde trompeur!  
Acharnez-vous sur lui, farouches.  
Et qu'il soit chassé par les mouches,  
Puisque les hommes en ont peur!"

Our pretorian guards understood little of the allegory, but they were charmed by the harmony of the language and the meter, and unwittingly applauded the ode of retribution.

From that moment all eyes in France turned to the exile's island. From time to time came master-works therefrom,—the "Contempla-

\* Translated from the original French, which was written expressly for the CENTURY MAGAZINE.

tions," the "Chansons des Rues et des Bois," the "Misérables," the "Travailleurs de la Mer," "L'Homme qui Rit," and the admirable "Légende des Siècles," which marked a forward step in the poet's life-labors. Each was received with unanimous acclamation. Admiration held us bound to the poet. We read with affectionate sorrow his noble and mournful dedications:

"Livre qu'un vent t'emporte  
En France où je suis né:  
L'arbre déraciné  
Donne sa feuille morte. . . ."

And below them the flaming initials: V. H.

The attitude of his friends, the romanticists, served as example to us of a younger generation. All were faithful to him; even those who accepted the Empire, like Théophile Gautier and Sainte-Beuve, refused to desert the veteran. In the closing days of the Empire, "Hernani" was represented at the Théâtre Français. Édouard Thierry, a romanticist, was the manager, and it was he who put the heroic drama on the stage. The audience received it very warmly. So, by his memory and by his books, during the entire reign of Napoleon III., Hugo lived in the midst of us.

All the poets of to-day, who are his sons, sent him their enthusiastic homage, for the imperial police could not close the mouth of the muse. Banville wrote his "Ballade à Victor Hugo, Père de tous les Rimeurs." Its sad refrain expressed the thought which dwelt in our hearts and presided at our gatherings:

"Gautier parmi ces joailliers  
Est prince, et Leconte de Lisle  
Forge l'or dans ses ateliers:  
Mais le Père est là-bas dans l'île."

We could imagine him, "le Père," seated on those rocks which he loves to describe, on the shore of the sounding sea, the coast-line of France traced dimly on the horizon. We could see his eyes follow the white sails, innocently cruel in their invitations to him who could not follow them to his fatherland. His banishment clothed him with a wild and sublime majesty. Guernsey was only a pedestal for his fame, an observatory from which he viewed and encouraged us.

"Islands," said a friend of mine the other day, "occupy a large place in the history of our time. Think of Corsica and Saint Helena, of Guernsey and Caprera! Things that exceed the common stature of humanity take place on the islands." The island where Hugo lived is no less glorious than that which saw the birth of Napoleon.

To visit our proscribed king the seas had to be crossed. From time to time pilgrimages

were made to Guernsey. The Empire was so confident of its stability that it ceased to trouble itself about these matters,—the lyre could be no serious rival to the sword. The doors of his country were opened, but Hugo would not come in. He continued his protest by submitting to voluntary exile; he was one of those whom the success of brute force could not tame.

"S'il n'en reste que dix, je serai le dixième,  
Et s'il n'en reste qu'un, je serai celui-là."

Those eighteen years of banishment did much to keep his fame untarnished. He reigned without diminution of popularity. He would have been less great had he not suffered proscription. His terrible ordeal was of use to him; it not only added to his lyre a new and powerful chord, it also served, by keeping his life remote, to prevent his admirers from ever growing weary of him.

But at last the king came home again, and events combined to give him a welcome worthy of his renown. The prophecy of the poet was fulfilled. Improbable as they had sounded when foretold, in the early days of the victorious empire, all the predicted chastisements were turned to reality. Sedan was, indeed, a sorry counterpart of the First Empire,—the inglorious collapse of the edifice of December. France, alas! seemed to bend beneath the blow; defeat struck not the sovereign alone, but the nation. All was wreck and ruin. Prussia's iron band was closing around Paris. It was therefore a day full of emotion for us all when, amid the anguish of invasion, we learned that Victor Hugo was coming. He came at the very moment when the investment was complete, with the last train, the last breath of free air. On the way, he had seen the Bavarians; he had seen villages burnt with petroleum, and he came to imprison himself in Paris. On his arrival at the Saint-Lazare station, a memorable ovation was given him by the people,—a clamorous people, stirred by the revolutionary spirit, ready for great deeds, rejoicing in its reconquered liberty rather than frightened by the cannon which growled at its ramparts. I can see the carriage making its way down the Rue d'Amsterdam, Victor Hugo standing upright in it, borne by the mob, and weeping. Surely, this was the pinnacle of greatness: that a poet's destiny should thus be made part of occurrences so fateful.

On the morrow, the memory of this great reception was swept away in a wave of lamentable events. But at least the poet was among us; his poems were read in the theaters, in the guard-rooms, even in the forts,

while the shells were whistling through the air. It was during the siege that I saw him for the first time face to face. I was at the Théâtre Français, the vestibule of which had been turned into a hospital. Beds were laid in rows under the mirrors; Édouard Thierry, the manager, in the cap of the ambulance service, the red cross on the ground-work of white worked upon his sleeve, was directing the dressing of wounds; Madam Favart, Nathalie, and Madeleine Brohan, were tending the wounded; and the poet, with the *képi* of a national guard upon his head, was passing silent and sorrowful among the beds of the vanquished.

Hugo took up his abode in the Rue de Clichy. All Paris, which had suffered his absence so long, came there to visit him; there were dinners and parties every day at his house. I, among the rest, went to call on the master, and took my wife, who, being reared in a family of artists, knew Hugo's poetry as well as I, and held him in equal regard. Flaubert was to introduce us. In a troubled voice we asked the porter to tell us on which story Victor Hugo lived. The simple words seemed hard to pronounce. We were asking on which story lived Bug-Jargal, Hernani, Ruy-Blas. Could they inhabit a *bourgeois* lodging in the Rue de Clichy? The poet lived on the third story; his rooms were adorned with works of art; in the drawing-room were fine pieces of bronze and a large Venetian chandelier.

In meeting Victor Hugo, my preconceived ideas suffered no shock. His simple, peaceful dignity fascinated me. I contemplated at leisure that extraordinary forehead; those cheeks which had the tint of a rock embrowned by the sea-winds; the beard and hair short and bristling, shaded like old wood-moss; the eye deep and soft, generally motionless, fastened upon an image within itself. After my first visit, I could chat with him familiarly, and on these occasions the cold eyes would brighten, and Hugo would regard me with the expression of playful slyness which he sometimes assumes. Those who talk freely with the poet are few. His genius inspires too much respect.

I spent a delicious evening—for, to have heard Hugo talk, is one of the pleasantest recollections of my literary life. He has a prodigious memory which forgets nothing, grasps the entire century, links together twenty generations, and passes with all the freshness of youth from M. de Talleyrand to M. de Broglie, from the first Bonaparte to Napoleon III. We, like him, had seen the siege of Paris; but, unlike us, he had seen the War in Spain. His mode of address is

an original mixture of lofty politeness and easy good-nature, having something of the manner of an old French peer, who in antique style kisses the hand of a lady,—and combined with this something also of the affectionate familiarity of the exile.

Madame Drouët did the honors of Hugo's drawing-room. She was his companion in banishment, his invaluable friend, and, as she stood beside us smiling, her hair white as swan's down, she amply justified the reputation for beauty which she enjoyed in her day. The poet's grandchildren entered the room, all tumbled and disordered. Jeanne and Georges are the children of Charles Hugo, the poet's eldest son, who died in 1871, and was brought by his father from Bordeaux to Paris at the moment when the revolution of March 18 burst on us. The barricades of the Place de la Bastille opened respectfully before the mourning father, and let the hearse go by which held the body of his son. This son, whose death was so deeply lamented, left Victor Hugo two charming children, who love him and are worshiped by him. Their grace and dainty qualities he has sung in "l'Art d'être Grand-Père." Their mother, who accompanied them, is a very pretty young woman, with large, bright eyes, a person of elegance and fashion, who knows how to bring to the poet all that he needs of the bustle and gossip of Paris. Near her stood one who was to become her second husband,—Édouard Lockroy, who, in the last days of the Empire, founded the newspaper "Le Rappel," having for partners Meurice, Vacquerie, and the two sons of Victor Hugo. Lockroy's face is bright and lively, typical of Paris which has chosen him for its deputy,—a witty, saucy face, without fear or reproach, young, in spite of its prematurely whitened hair. I knew him as an art-student, when he was leaving the studio, a true *rapin*, fond of making caricatures. He might have become a painter, too, but his father, an author and actor, had played in Hugo's romantic dramas, and that achievement, it appears, marked out the son for a career of adventure. And, in truth, the jovial fellow, taking life broadly, asking no better than to laugh, met with adventures in abundance. He was sent to Syria by an illustrated paper to sketch the massacres of Christians by the Druses. He was found by M. Renan under some forlorn Mussulman roof, abandoned, robbed, shivering with fever. Still thirsting for travel and excitement, he donned a red shirt, and accompanied the cosmopolitan hero, whom Italy so loudly mourns to-day. He took part in nearly all the expeditions of Garibaldi. At present he is simply the wittiest of our deputies.

Vacquerie, a masterly writer, I also saw, and Meurice, his inseparable crony. Both were recruits, though now promoted, of the great wars of romanticism. One is tall, the other short: Auguste Vacquerie thin and long,—a Norman Don Quixote; Paul Meurice of Kal-muck build, with hair brushed straight and mustache hard and stiff. Both formed part of the family. Then came the intimate friends of the house,—Paul de Saint Victor, the author of "*Hommes et Dieux*," the most delicate worker in prose known to our literature since Gautier; Théodore de Banville, the latest, but not the least fervid of the romanticists; Leconte de Lisle, chief of the poetic school of the Parnassians; Emile de Girardin, Ivan Tourguéneff, Gustave Flaubert, Monselet, and others whom I forget. Of those whom I saw in Hugo's drawing-room, surrounding him under the chandelier, listening to him, hymning his glory, some are no more. Flaubert, Girardin, Saint-Victor,—the novelist, the journalist, the critic: these have passed out of the circle of the poet's friends. Death has taken them from us.

In the midst of the tributes paid by so many master-minds to Victor Hugo, as to a king who, after a long voyage, returns to take possession of his throne, I felt more than once a very singular emotion. One notices that, in spite of all, the poet retains evidences of his adventurous life, even in the short and easy jacket which he wears. One thinks involuntarily of the promiscuous society with which he must so long have mingled. Of the flood of visitors who thronged Hugo's drawing-room, many came and were received who had never been seen there before December. I often reflected on the life of exiled kings, as I stood in this throng and saw the purest diamond in Parisian society rubbed by the commonest pebble. Kings, as well as proscribed poets, must adopt the same tolerant mode of existence, make the same submission to social necessities, permit the same facility of intercourse. I will add, moreover, that the serious side of my book, "*Les Rois en Exil*," was studied in the drawing-room of Victor Hugo.

In those days, when the great poet talked more than to-day, he would install himself on a narrow, little sofa, where there was only room for two. Each of us, in turn, would there take seat beside him and chat for a few moments. Now, in later days, the evenings are less prolonged than of old, and come to an end about ten o'clock; but when I first used to go to the Rue de Clichy, we still indulged in those midnight cups of tea which Hugo would fortify with rum and transform to grog of formidable strength. One day

he served me himself, and emptied into both our cups about half a bottle of rum mixed with Spanish wine, thus concocting an old Guernsey sea-dog's "night-cap." I felt scorched for a week, but Hugo drank it without winking, and with Olympian serenity.

His health, in fact, is wonderfully robust. His eighty years are full of sap. At table, he is well worth watching. Sound in digestion, strong in appetite, between each dish he pours out huge draughts of sweet wine. He eats slowly, with majestic air, masticating his food like an old lion. You feel that he is a man always in good health; one who bathes every morning in cold water; who works with open windows; who, when he comes home in winter from the Senate, does not even close the carriage windows. He seems to grow no older. His voice alone has changed somewhat. There are longer pauses in his speech. His words seem to come from a distance.

His life has always been scrupulously exact. In the days of the Rue de Clichy, he rose at five and went out at eight, save in extraordinarily bad weather. Like Montaigne and Madame de Staël, he always loved the great city, even its gutters, even its evil spots. But since his return from exile this passion has grown stronger than ever. Who does not know the lines which he addressed to Paris at the moment of his return,—the lines which breathe so deep an affection:

"J'irai, je rentrerai dans ta muraille sainte,  
Ô Paris!  
Je te rapporterai l'âme jamais éteinte  
Des proscrits."

He had scarcely arrived in the beloved city before he was anxious to know its new districts, its latest passages, its broad avenues, now filled with the noise of the horns of the tramway conductors, the Seine covered with ferry-boats. All those innovations of late years, which give Paris a new physiognomy, rejoiced the heart of the poet. His greatest pleasure, at early morning, was to climb to the top of an omnibus, and so traverse the whole city, passing the sumptuous boulevards, the workmen's quarters, the districts of the poor, until he reached the gloomy streets of the suburbs, near the fortifications where, along the walls that skirt the yards of low, one-storied houses, grow in luxuriance the dandelion and the nettle. Every day, in the heart of Paris, which is undergoing so many changes, Victor Hugo would discover some picturesque, unknown corner; and it is in this manner, on the top of an omnibus, observing and dreaming, at the time when the streets awaken to their morning life,

that he has written most of his latest poems. Indeed, there can be no better observatory, none more propitious to the flashing glance of thought, the straying of the imagination, than this humble post on the public conveyance, which, going from one barrier to the other, making its easy journey in three-quarters of an hour, introduces you successively to all the quarters of Paris, revealing and anon concealing, as in a dream, the rich first floor, with its heavy, ornamented curtains half-opened, and with its creamy waves of muslin, and, farther on, the poorer suburbs, where the eye looks into basements sombre and bare, for which a tin reflector steals from the street a few rays of sunlight, or where, for the needs of work or of trade, the gas is lighted before noon. Victor Hugo was known to his neighbors on the omnibus. They had learnt the name of the fine-looking, strong, old man, in his short jacket, with a felt hat on his head, who took his place beside them and politely passed their change. Sometimes the conductor had to inform them, whispering in their ear, "It is Victor Hugo." But the poet's wish to be unrecognized was more gallantly respected than that of a queen on her travels. His desire was understood by all, and while they might glance at him aside, out of a corner of the eye, they pretended not to know him. In the south of France, at Marseilles for example, where everything is expressed, where the people are turbulent and enthusiastic, the carriage would have been unharnessed, the pavements lined with people, the drive interrupted. In Paris, the citizens are of finer instinct, their discretion is exquisitely delicate. At the time of François Victor Hugo's death—François, the last of his sons,—the poet, leaving the deserted home, the distracted household, and seeking solitude in the crowd, had contracted an almost daily habit of lunching on a cutlet or a couple of eggs, and of reading the papers at a tavern in the district of Saint Georges. It was a meeting-place of painters and men of letters. One of my friends, a poet, who took his meal at the same hour, would sometimes find himself seated at a table near the master. Often he would pass him the newspaper, the salt forgotten by the waiter, or the bottle of ice-water. He was sorely tempted to make himself known, for Hugo would have recalled his name. But he was discreet, and held his peace, and even now, his dream, his most ardent desire, is to be introduced to the poet.

When his morning ride is over, Victor Hugo comes home, takes lunch, and, if there be no session in the Senate, writes and works

till evening. In his wonderful organism, so healthy and well balanced, the production of literary work has never been for a moment arrested, either by sorrow or by exile. His capacity resembles a vast spring of water, a Vaucluse fountain fed perennially by the fall of snow and recent rain, drawing from unfathomable depths into the sunlight, with astonishing fullness, force, and regularity, its overflowing waters, bubbling and clear. What glorious verses, what waves of thought and imagery, still lie hidden beneath the soil! Victor Hugo will never check the supply; he can keep nothing back; he would give us all he has. It is admirable to hear him talk, with his placid smile, and the serene tranquility of a sage, concerning the few years which are left him to live, the grand schemes which he carries in his head, and which he would not leave unfinished. Happily, there is no limit at hand beyond which his green old age may not expand, and here, in these latest months, is a splendid work which the whole world reads with admiration,—"*Torquemada*," the dramatic epic of the Inquisition.

Hugo himself reads nothing, for he has no time to spare. No literary work of our day has ever passed under his eyes. He has never read one of my books. On one occasion, when he was about to pay me some compliment, I hastened to interrupt him. His almost paternal friendship for the man is more dear to me than would be his esteem for the writer. By way of exception, however, he read the articles which Emile Zola devoted to him in the "*Figaro*." In the midst of the great concert of admiration which France performed at the feet of the old poet, one discordant note, and one alone, was heard. The novelist attacked Hugo with zeal, often with harshness. He had no personal antipathy for the poet, but made the attack in accordance with his literary theories. In assailing the author of "*Notre Dame de Paris*" he meant to assail the chief of the romantic movement. For my own part, without being at all embarrassed by the recollection of those attacks, I told Hugo how sincerely I prized the abilities of Emile Zola. And Zola, on his side, knows perfectly well what I think of the criticisms showered by him on the patriarch of romanticism. Whatever may be said or done, Hugo's literary influence is unbounded, and we all are subject to it, Zola as well as the rest. Hugo has invented a language and has imposed it on his epoch. It is a violent language and a bold one; it is full of resonance and color; it is, in brief, the language of the nineteenth century, the only language that can express the passions and paint the aspects of our society, which a complex civil-

ization has thrown into disorder. We may regret the language of the seventeenth century, or that of Voltaire. But, whether we will or no, from the day we take a pen in hand, we must write the language of Victor Hugo. Verse-maker or prose-maker, none escapes him, not even Balzac: nay, Balzac less than others, for the keen steel of Balzac's tools was tempered in the master's forge. For this reason we should only speak of him and his work with a profound sentiment of gratitude and admiration. A dutiful son, though he be strong and tall, will not war with his grandfather, particularly if his weapons are borrowed from the elder's panoply.

Moreover, whatever inevitable signs of weakness may be shown by a genius which is too prolific to be always perfect, Victor Hugo performs in our country, at the present time, an office which is his alone, and the glory of which none can dispute. Without Hugo, I am fond of repeating, France, being devoted to prose, would have lost the habit of the great language of poetry. Save a few stage verses, which are the better received the more they resemble prose, I can say in sober earnest, that the poems of Victor Hugo are the only poems to which the French public lends ear to-day. The sisterhood which worshiped Lamartine, the lily-browed and fair-tressed maidens, have long since closed their dreamy eyes. Our young men have forgotten Musset, and care no more for wild orgies. Pierre Dupont is forgotten; Béranger, the great Béranger whom Châteaubriand admired, is sung no more, not even in the tap-rooms. Those admirable artists, Baudelaire and Gautier, who are dead, Banville and Leconte de Lisle, who live, have no fit renown outside the narrow circle of men of letters and men of taste. As for the young contemporary poets, with the possible exception of François Coppée, they know that their flasks, filled with refined essences, are not to the taste of the public. In this general disarray of our poets, Hugo alone covers the retreat: blowing the horn of Roncevaux, creating the din and doing the work of an army.

If fame so great as his brooks few contradictions, in practical life on the other hand it has its inconveniences. Unless he learns to keep his working-hours free from the trespass of the importunate, the life of a distinguished man of our time is no longer his own. The folks who scribble and rhyme have not always observed, in their relations with Victor Hugo, the discretion and reserve which we have applauded in his fellow-travelers of the omnibus. They deny the poet his free and peaceful enjoyment of his small fragment of life, some corner, some particle of which is being daily

worn away by the current of the century. Worthy people, thinking no harm, write to Victor Hugo, begging a reply and demanding his opinion of several stout volumes of five hundred pages each. Well, I really am not spiteful, but I cannot conceal the satisfaction with which I now shatter their illusions, the joy with which I say to them: "Write, good friends, send Victor Hugo your volumes; Victor Hugo will not read them. Victor Hugo will not even open your letters." He has two good watch-dogs, Mme. Drouët and Richard Lesclide, the latter an enthusiast from Bordeaux, whose admiration for the poet made him take the part of secretary. It is Mme. Drouët and Richard Lesclide who read and reply. While they are thus engaged, the poet is at leisure to write poetry. What would become of him, ye gods! if he had merely to open the mail which reaches him every morning from France and from abroad. What would he do with the particularly impertinent letters which sometimes find their way into his correspondence. Hugo once received a request from a country lawyer, quite unknown to him, who wanted one hundred thousand francs by return of post, or was else determined to blow out his brains. Nobody can imagine, indeed, what strange demands we literary people, who are somewhat before the public, are liable to receive. It is barely six weeks ago that a young Prussian countess, whose name I had never heard, took to sending me letters and notes of every size and shape. She said that she needed eighty thousand francs to unite her to the man of her choice, and make her life happy. She added that nothing could be easier for me than to obtain this sum among my Parisian friends. If I could obtain it, I confess I would put it to another use than that of joining this unknown Dorothea to her Hermann.

After his correspondence, the reception of visitors causes a considerable waste of the poet's time. Admiration is naturally as indiscreet as it is candid. All who go through Paris want to see Victor Hugo: from the Emperor of Brazil and the King of the Sandwich Islands to the English or American young ladies who, with a letter of introduction in their hand, and a guide-book under their arm, go to see the poet after they have paid their respects to the tomb of Napoleon, the treasure of Notre Dame, and the well of Grenelle. Victor Hugo's household undertakes to defend him from the enthusiasm of travelers and the attentions of foreigners. But, in the days when the poet lived in the Rue de Clichy, this defense was difficult. The easiest way to save him from vulgar impertinence was to remove him from the center of Paris.

He has been living for several years in one of the avenues which lead from the Arc de Triomphe to the fortifications. A recent decision of the Municipal Council of Paris has changed its name from the Avenue d'Eylau to the Avenue Victor Hugo. The district is in a state of transition, being not yet wholly Paris, and nevertheless being no longer the country. Its mansions, all of white, too high to stand solitary, seem unstable enough to cause alarm, and look like children's toy-houses, lost in the monotonous expanse of building-sites clotted with scanty grass and heaped with rubbish, enclosed by gray palings, with a cabbage-garden or a patch of artichokes kept in order by the janitor of the place, and here and there with a board marking the lots which are for sale and giving the address of the agent. Few go by in the day-time; a white-washer's cart may be seen, or a market-gardener's, or perhaps a couple of red-trousered soldiers strolling disconsolate through the neighborhood. At night there is complete solitude: gas-lamps stand at long distances apart, in a melancholy row, serving no other purpose than that of making the night more visible; and beyond, in the endless darkness of the avenue, shining like a light-house to the visitor who has lost his way, are the kitchens of two little solitary residences, always open and always gleaming, throwing their hospitable light over five or six yards of the pavement. Those two residences are the home of Victor Hugo. They are built in the English fashion, after the style now popular in the belt of houses which gird Paris,—commodious and private, having neither janitor nor neighbors, realizing the dream of being truly at home.

The poet occupies one of them. In the neighboring house, which has a door in its wall, live the grandchildren of Victor Hugo, with their mother and Édouard Lockroy, her second husband. I name the children first because they are the masters, and, in a degree, the tyrants of the two houses. The mode of life, indeed, has undergone no change in the new home. We occasionally go to dinner in the Avenue Victor Hugo, as we went in the Rue de Clichy, and we are still fascinated by the simple welcome that awaits us. The evening receptions are attended by the same friends as of old; but there is less crowding and more intimacy.

This dwelling, which to the stranger seems so modest, has had its day of epic grandeur; it is for ever memorable to those who, like myself, witnessed the rejoicings of February 25, 1881. On that day it became for an instant the center of the first city in the world: for the whole of Paris came to its doors to lay there a tribute of admiration. In 1879, when

"Ruy Blas" was revived at the Théâtre Français, Victor Hugo had already been acclaimed by those whom convention calls "All Paris." The emotion and cheers of this distinguished throng, which saw the old master-work revived after so many years, were very sweet to Victor Hugo. In 1880, at the fiftieth anniversary of "Hernani" he saw his bust crowned, amid the actors, by the hands of Sarah Bernhardt; and on that day he truly felt that, being still alive, he had passed into immortality. But there still was wanting the popular festival, more spontaneous, conceived on a grander scale, which should show the poet how deeply his work had penetrated France, how much he was loved even by those who could scarcely read,—by the poor, the artisans, the "misérables" for whom he had often written, whose sufferings he had told, whose cause he had championed. All were full of gratitude, and the seed sown in the shadow, in so many thousand hearts, was bound to bear at least one glorious harvest.

Such was the character of last year's festival. Springing from an instinctive and enthusiastic movement of public opinion, it took as its pretext the celebration of the eightieth birthday of the poet, who, in reality, was only seventy-nine. An immense crowd, such as Paris alone can gather, passed in surging waves, for hours together, beneath Hugo's windows. They came from all points of the city, and formed a procession in the Place de l'Étoile. The trumpeters went first, sounding their brazen melodies; the corporation followed after, bearing their ensigns as before a sovereign. Flowers were carried in the crowd, and crowns and flags. Banners floated in the wind, and on these standards of peace, inscribed, not with the names of bloody victories, but with the date of the greatest battles of thought, I could read "Hernani," "Les Feuilles d'Automne," "Les Orientales," and see all the dreams of my childhood passing before me in a worthy apotheosis.

I walked in the throng with my wife and children. We advanced with difficulty, so long was the procession. We were placed by chance amid a group of freemasons, who were marching behind their banner, each carrying his scarf in a shoulder-knot, as on a holiday. We marched behind a poorly dressed couple, a man and a woman, and when we came in sight of the house, covered already with tributary flowers, and observed the poet standing with his grand-children, while all Paris defiled before his window—

"Put on your scarf," cried the woman in front of us.

"I dare not," replied her husband, "it is too dirty."

"What does that matter?" cried she. "He will not see it."

So the old, soiled scarf was brought out, having done duty at all the ceremonies of the order; and as we passed the house our friend rolled it around him. In truth, the poet did not see the scarf,—this simple token of respect,—but I afterward related to him the little dialogue, and he smiled.

I did not go to see Hugo on the day of the festival. I remained in the street with the crowd, and shouted like the rest—like a hundred thousand other Parisians. But I did go the next day. The house wore a new aspect. The crowns were heaped up in the

conservatory; in the drawing-room hung banners and garlands, grouped with excellent taste amid palms and bouquets; the furniture was hidden beneath the flower-offerings. The children were there, wearied with standing so long at the window and replying with their little hands to the acclamations of the crowd. Alone, unwearied, amid the gifts of our City of Light, which, in one day, had paid its debt of gratitude to him who adds so much to its splendor, appeared Victor Hugo, still calm, serious, majestic, his serenity unbroken by the most glorious homage which has ever been received by man living among men.

*Alphonse Daudet.*

## THE POET YEARS.

(1807 TO 1812.)

(Longfellow, Whittier, Mrs. Browning, Dr. Holmes, Tennyson, Poe, and Robert Browning were born during these years.)

DROP those six pages from the century's story,  
And how much of its radiance were gone;  
Drop from the day its crowning sunset glory,  
The calm light of its dawn!

From that glad spring-time broke a full-voiced bevy,  
With singing every heart and house to fill—  
Perennial, though bound and stark and heavy  
The wintry earth lies still.

The robin, caroling so cheer, so docile;  
The shy wood-thrush's chiming vesper-bell;  
New England's bobolink, old England's throistle,  
With blithe or plaintive swell;

The British blackbird's musical elations  
America's wide vales and corn-fields thrill;  
Far Britain hears the nightly iterations  
Of mourning whip-poor-will.

And both lands catch the wild-bird notes obscurer  
That yet rise ever and again so strong,  
So high and clear—his flight than petrel surer,—  
Imperial his song.

O choral jubilant! O years of healing,  
Of joy and light and solace, hope and peace!  
Long, long ere shall be hushed your anthem pealing,  
Your consolation cease!

*James T. McKay.*

## A COAL FRAGMENT.

AMID the fields of snow and ice  
Which block the passage to the pole,  
Mysterious lands which still entice  
The adventurous modern soul,

This fragment of a softer clime,  
Of some dead summer-world, was found,  
The unburied relic of a time  
That slumbers in its mound:

A black coal fragment marked with ferns,  
No thing of beauty—yet to me  
A dream of life that darkly burns  
Beneath the arctic sea.

*G. E. Montgomery.*

---

## A NEW PROFESSION FOR WOMEN.

THE stranger in New York who may chance to visit the east side of the city in the neighborhood of Twenty-sixth street will have his attention called to a long, grayish, four-story prison-like structure, with a wing, situated in a block which extends to the East River, and inclosed by a high, forbidding stone wall. This is Bellevue Hospital, the chief free public institution of the kind in New York. For many years it has been famous for the high medical and surgical skill of which it is the theater, its faculty embracing many leading members of the profession in the city. For many years to come it is likely to be popularly associated with another high development of the curative arts,—the results of the founding, in 1873, of the Bellevue Training-school for Nurses, and of a new profession for women in America.

Not long ago, a lady living in the suburbs of one of our eastern cities, whose daughter was ill with fever, was urged by her physician to employ a professional nurse. She was loth to do this, but, as the malady increased in virulence, she finally yielded. The following morning the servant announced "the nurse." To the mother's imagination—overwrought as it was by lack of rest and by unrelenting watching—the words called up the most disagreeable anticipations of a careless and disorderly person, and perhaps even a dark reminiscence of Sairey Gamp scolding trembling invalids, removing their pillows, or drinking copiously from black bottles, while grim-visaged Betsey Prig looked on with unconcern. With these pictures of the professional nurse before her, she descended to the hall. There, to her surprise, she found a young woman of intelligent face, neat apparel, and quiet demeanor.

"You are ——"

"The nurse, madam."

Saying which, the stranger exhibited a badge inscribed with the words "Bellevue Hospital Training-school for Nurses," and decorated with a stork, the emblem of watchfulness.

The physician now appearing, the nurse listened attentively to his instructions. Her movements, while preparing for duty, inspired with confidence both mother and patient. Her skillful hand prepared the food, her watchful eye anticipated every want. She was calm, patient, and sympathizing; but, though eager to please and cheer the invalid, she did not stoop to simulate an affection she did not feel, nor to express hopes of recovery that could not be realized. The exaction, the impatience incident to illness, seemed but to incite her to renewed effort in behalf of her charge. She met every emergency with knowledge and unruffled spirit. To the physician she proved an invaluable assistant, executing his orders intelligently, and recording accurately the various symptoms as they were developed. She watched the temperature of the room as closely as she did that of the patient, and, while always polite and obliging, was never obsequious. The mother had doubtless heard indirectly of the school of which her efficient nurse was a graduate, but she was, as many others are, unfamiliar with its work and aims.

To understand the almost revolutionary progress that, through the instrumentality of this school, has been made in the system of nursing the sick, let us look for a moment at the previous condition of this great hospital. The present building was constructed about

sixty years ago, by the poor-house authorities; for thirty years it was an almshouse, and since then it has been used exclusively for hospital purposes. So unenlightened was the general view of the obligations of a city toward its sick and injured in those days, that for years the only nursing was done by convicts of the Female Penitentiary. The profanity, drunkenness, theft, and profligacy of these attendants were soon too scandalous to be ignored, and in 1848 this system was abolished, and "hired nurses, selected from among poor women of reputable character and decent habits," were employed in all the wards.\* The advance from no nursing to poor nursing told sensibly on the death-rate, which, however, owing to poor hospital supplies, bad ventilation and beds, defects of heating and cleanliness, and the general indifference to the welfare of the patients, still continued large; the best medical skill was useless against incompetence and neglect.

So matters continued until the year 1872, when the attention of the Local Visiting Committee of the New York State Charities Aid Association† was called to Bellevue. This committee was composed of sixty members, chiefly ladies of high social position and intelligence, two visitors being assigned to each ward. Their duties were to visit the hospital weekly, and to report its actual condition to the Association. They found in the building nine hundred patients, most of them in want, many in positive distress. The men's wards were so crowded that three patients would have to sleep on two beds and five on three. Others were forced to sleep on the floor without blankets or pillows, as there was no supply of extra clothing, except what could be obtained from the stock belonging to deceased patients. A few of the "hired nurses" were still there, and they seemed to have learned nothing by experience, save indifference to suffering. There were no night nurses, and only three night watchmen for six hundred patients. They sometimes drugged the patients with morphine to keep them quiet, and drank the stimulants that had been prescribed. In the kitchen it was ascertained that tea and soup were frequently made in the same boiler; the coffee was nauseous, and the beef dry and hard. "Special diet" existed only in name, and, even if ordered and provided, it had little chance of reaching the patients or even the nurses, being confiscated on the way up from the kitchen by the work-house women, who had been committed for drunkenness or dis-

orderly conduct, and had been transferred to Bellevue as "helpers."

Judging from these inspections, the committee became convinced that no improvement could be hoped for in the management of the hospital until a complete reform of the nursing should be effected; and, inspired by the example and success of similar work in England by Florence Nightingale, the founder of the modern system of nursing, they set themselves to this task with resolution, tact, and intelligence. At first they met with little encouragement from the medical profession, but now their staunchest supporters are found within it. One distinguished physician said, "I do not believe in the success of a training-school for nurses at Bellevue. The patients are of a class so difficult to deal with, and the service is so laborious, that the conscientious, intelligent women you are looking for will lose heart and hope long before the two years of training are over."\* A clergyman well acquainted with the hospital echoed this opinion, and thought it was "not a proper place for ladies to visit." One or two physicians thought the lives of such people not worth saving. Other grades of opposition or indifference presented themselves—political, social and professional. The experiment was a new one, and the theory on which it was undertaken ran counter to the traditions of those employed in the hospital. Before such obstacles, stout hearts might well have hesitated, but the courageous and intelligent managers were only thereby the more firmly convinced of the necessity of patient and persistent effort.

The first step was to learn how to organize the school in the best way, and for this end Dr. W. Gill Wylie, of New York, volunteered to go to Europe at his own expense, to study the foreign systems. Upon his return he brought a cordial letter from Miss Nightingale, in which she set forth the principles upon which the management of the school has been based. Chief of these is the entire subordination of the nursing corps to the medical staff, the nurses being under the discipline of a superintendent, or matron, whose duty it is to see that the work is performed to the satisfaction of the physicians. To her report the head-nurses, who have a surveillance of both the day and night nurses. The position assigned to the matron, by which she is made solely responsible for the effi-

\* Exceptions to the general attitude were found in the cordial coöperation of the late Dr. James R. Wood, Dr. Austin Flint, and Dr. Stephen Smith, who were fast friends of the enterprise from the start, and have been of the greatest aid as advisers to the Board of Management.

\*Address of Dr. Reese.

† See "A Great Charity Reform," in THE CENTURY MAGAZINE for July, 1882.

ciency of the nursing corps, is one of the most important features. The tact and judgment displayed by the training-school managers in the practical application of these sensible ideas of the function of nursing, have saved a vast amount of friction, and won for the school the friendship of many physicians who were naturally prejudiced against it, and might easily have been forced into opposition by any encroachment upon their rights.

The boundaries of the nurses' duties having been laid down with circumspection, voluntary subscriptions were called for and made to the amount of \$23,000, and a house was rented near the hospital, in which the nurses should lodge and board.

To find a person capable of taking charge of such an institution proved a difficult task. Miss Bowden, otherwise known as "Sister Helen, of All Saints," then of Baltimore, but formerly of the well-known school at University College, London, was finally selected. Equal difficulty was experienced in procuring assistants for her. Advertisements were inserted in the journals, and physicians were applied to; but such was the scarcity of educated nurses in this country at that time, that, after a search of many months, and after the most liberal offers, only four were found who were in any wise capable, one of whom proved inefficient. Later on, Sister Helen, compelled to return to England, was succeeded by Miss Perkins, of Norwich, Conn., under whose management the school has continued to increase in numbers and usefulness. At first but six pupils were obtained. The scheme adopted—that developed by Miss Nightingale—demanded in the applicant a combination of requisites the mere enumeration of which appalled many who had been encouraged to seek admission to the school. These are: Good education, strong constitution, freedom from physical defects, including those of sight and hearing, and unexceptionable references. The course of training consists in dressing wounds, applying fomentations, bathing and care of helpless patients, making beds, and managing positions. Then follow the preparation and application of bandages, making rollers and linings of splints. The nurse must also learn how to prepare, cook, and serve delicacies for the invalid. Instruction is given in the best practical methods of supplying fresh air, and of warming and ventilating the sick-room. In order to remain through the two years' course and obtain a diploma, still more is required, viz.: Exemplary deportment, patience, industry, and obedience. The first year's experience was far from satisfactory. Among seventy-three applicants, hailing from the various States, only twenty-nine were found

that gave promise of ability to fulfill the conditions. Of these, ten were dismissed for various causes before the expiration of the first nine months. To serve medicine to the patients in the wards of a great public hospital smacks not a little of novelty and of romance, and goes far, at first, to compensate for a hospital's unpleasant surroundings and its odor of disinfectants; but a short period of wound-dressing and night-watching is sufficient to dispel such illusions. Every year, young women whose abilities warranted their admittance at the commencement of the course have been permitted to depart before its completion, owing to an evident distaste on their part for the duties imposed upon them. But the managers, though surprised at the result of their first efforts, were not discouraged. As time went by, the number of applicants increased, and, though the high standard first established was not departed from, the proportion of those capable of fulfilling the requirements multiplied. Some applicants, who did not seem especially adapted to the work, proved most efficient, and on this topic the managers say that, after their long experience, they have found that the fitness of an applicant can be determined only by absolute trial.

The nurses at the Bellevue school may be divided into two classes: those who study the art of nursing with a view to gaining a livelihood or supporting their families, and those who look forward to a life of usefulness among the poor sick. All are lodged and boarded free of charge during the two years' course, and are paid a small sum monthly, while in the school, to defray their actual necessary expenses, and, in order to avoid all distinction between rich and poor, every nurse is expected to receive this pay.

The "Nurses' Home," the head-quarters of the school, is No. 426 East Twenty-sixth street, a large and handsome building, erected for the purpose and given to the school by Mrs. W. H. Osborn. From the outside of this building the tastefully arranged curtains and polished panes of its several chambers present a striking contrast to the somber, frowning walls of the great charity hospital opposite. Besides studying from text-books, and attending a systematic course of lectures, the pupils are occupied by the care of the patients in the hospital, and in the general management of the wards. The nurses are taught how to make accurate observations and reports of symptoms for the physicians' use, such as state of pulse, temperature, appetite, intelligence, delirium or stupor, breathing, sleep, condition of wounds, effect of diet, medicine, or stimulant. This instruction is given by the visiting and resident physicians and surgeons of Bellevue, at the bedside

of the patients, and by the superintendent and head-nurse. At first, only the female wards were supplied; but, as illness makes no distinction of sex, it was found impossible to complete the nurse's education without practice among sick men, and early in the career of the institution some of the male wards were included, until now 14 wards of from 16 to 20 beds each are under the supervision of the new system. There is no reason,

after a *mêlée* in which he was shot through the chest. His face wears a puzzled expression as the nurse quietly and skillfully dresses the wound; such kind attention is a revelation to him. In the next cot is a man who has been run over, while intoxicated, by a truck. His injuries are serious, and require the almost undivided attention of a skilled nurse; if she had not been at hand, the surgeon would be obliged to amputate the leg that now swings

BELLEVUE HOSPITAL AND GROUNDS.

except the want of money, why this system should not be extended to the entire hospital.

Look in at the male surgical ward. These young women in white caps and aprons and blue-and-white striped seersucker dresses seem to have had something of the training of the soldier added to that of the nurse. There is little talking and no laughing. When they do speak, it is in subdued tones. Each seems to understand her duties. One of the house physicians enters, and, beckoning to a nurse, gives her directions regarding a particular patient recently visited. She listens attentively makes no reply, and turns at once to obey. A soldier, pausing in his rounds, presenting arms to his superior officer and listening respectfully for orders, would not have exhibited a more perfect discipline. On either hand the patients lie on their cots, in the various stages of relapse or recovery. As a rule, these are hard-featured, ill-favored men. Some are only waiting here until the healing of their wounds to be tried for felonious assault, house-breaking, or murder. One is a bar-keeper, brought in the previous night in an ambulance,

easily upon the strap-support. On the opposite side of the ward, stretched upon a cot near the door, is a workman who has been injured by falling from a scaffold. He has a careworn, anxious expression, that proceeds not from physical, but mental troubles. He has just told the nurse that his wife is very ill, and that there is no one to look after her and the children. He does not know, but will soon learn, that another young woman with even more experience than the one sitting near him, is already on her way to his wife, the number of his house having been ascertained from the hospital entry-book on the ground floor. In another division of this ward are gathered the most complicated cases. The labors of the nurse must here be unremitting; yet little medicine is required. Some of these poor fellows who lie in rows are, doubtless, beyond the influence of that, but the world is still sweet to them, and the spark of life that fitfully lights up their wan, colorless faces may, if carefully tended, still be kept aglow. One patient is undergoing an operation, though not a dangerous one. The nurse stands by,

A DEMONSTRATION IN BANDAGING.

supporting his head and shoulders. Ether is not required, but the man has been already broken down with his malady; his face twitches with pain, his hands open and shut convulsively, and a groan escapes him, deep, prolonged, and expressive not only of present pain, but of the weary months of suffering that he has experienced. Now the surgeon's work is done, and the poor fellow, before sinking back again upon his pillow, murmurs a stuttering apology to the nurse for having shown what he takes to be weakness while under the lancet.

In the female wards the work of the trained nurses is employed to better purpose probably than elsewhere within the walls of the institution. The old and the young hobble about on crutches, or lie on their cots with blanched, careworn faces, and deep-sunken eyes. A kindly faced nurse is feeding an old woman from a bowl. Whatever it contains, it causes a smile to light up what before had been sullen and frigid features. Another is carefully bandaging a wounded arm, striving, meanwhile, to argue away from the sufferer the specter that haunts her. The most uninviting and wretched tenement-houses do not reveal a class more in need of help and sympathy than the patients in the female wards of Bellevue.

The bell of an ambulance which has just arrived strikes three startling strokes, the signal for the medical division. A few minutes pass, and two men bring in a stretcher, on which rests the form of a woman clad in genteel but much-worn apparel. Two nurses lift the motionless form upon a bed, and examine the card made out for each patient upon her arrival. It is superscribed "No Friends," and a careful examination of the small leather bag tightly clasped in her hand fails to furnish additional intelligence. She was found lying insensible upon the pavement, and, though she regained consciousness for a few minutes previous to the arrival of the ambulance, she stubbornly refused to answer questions, to give her name, or tell what ailed her. But the nurses soon discovered this trouble. The woman was starving—had been starving herself purposely. She had had some misfortune, of which she refused to speak. Her first words upon recovering consciousness were of regret that she had not been permitted to die. Later on, however, she was encouraged to partake of nourishing food. With this and good nursing, her spirits to a certain extent revived, until, upon her departure, she had, to all appearance, ceased to reflect upon that which had caused her distress.

Upon the completion of their labors in the

Training-School, and after passing a satisfactory examination, the nurses, furnished with diplomas, signed by the managers and the examining board of the hospital, begin their several careers. Some are called to superintend state and city hospitals, a continually increasing number seek private practice, or rather are sought by it, while not a few, as has already been said, devote themselves to the sick among the poor.

The value of the service performed by these noble women cannot be adequately estimated

tages of a nurse's training, would fail signally where she would succeed. For the mere attendance on the invalid is not the whole of the service performed by the visiting nurse. She sweeps and cleans the rooms, cooks the food, does the washing, if necessary, goes upon errands—in short, takes the place of the mother, if she be ill. All this has been learned at the training-school. Neither illness nor death itself can appall her: she has served a long novitiate in nursing the one, and the other has long since lost its terrors.

TENEMENT-HOUSE WORK.

without visiting the tenement-house district wherein it is performed. They lodge in a house provided for the purpose by the Woman's Branch of the City Missions, by which they are supported, and are to New York what the "District Nurses" are to London. From early morning until evening they endure fatigue, heat, cold, and storm, in their efforts to relieve the distressed. Neither the gruff responses, nor the ingratitude of those for whom they toil, have, in a single known instance, forced them to cease their work. An equally zealous person, without the advan-

Here is the substance of an account given by one of these charitable women, of a typical day's work.

"I heard that a young man was dying of consumption in a tenement-house on the east side. After searching for some time, I found the house, squeezed in between two larger and equally dilapidated structures, in the rear of those facing the street. It had no door, and, like such houses generally, was so dark, even in broad daylight, that I had to grope my way to the upper chambers by aid of the stair-rail. A woman in the yard told me that the

THE PATIENT.

man I wished to see lodged, she thought, on the top floor. Upon my arrival I knocked for some time at the doors of the front chambers, but no one answered. Then I tried the back hall-room. 'Who's there?' a man's voice roughly demanded. 'I want to speak with you,' I answered. 'Well, who are you?' I said that I would explain my business, if he would open the door, and, after a few moments, it was opened just a few inches. The face of a little, weazened old man appeared. 'What do you want?' he demanded, scowlingly. 'I heard there was an invalid here, and I want to try and do something for him.' 'Well, he doesn't want anything.' 'But,' I persisted, 'can't I see him for a moment?' 'No, you can't.' He would have slammed the door in my face, but I had caught sight of the poor fellow, his son, who was crouched in one corner. I beckoned to him, and he unwillingly came toward the door in time to prevent its being closed. 'Don't you like beef-tea?'

I asked. 'No, I don't,' he returned. 'But I have some here that you will like. I'm sure it's different from what you've seen. Let me make some for you. You needn't take it, if you don't like it.' 'I don't know,' he said. 'I might.' And, despite the scowls of the father, who was opposed to my entrance, I sat down by the stove, gathered some pieces of wood from a pile in the corner, and made a fire warm enough to heat the beef-tea. The young man was in the last stages of consumption, and said he had not eaten anything for some time, though I saw some bits of dry bread and pork upon an adjoining shelf. He had no sooner tasted the tea I made for him than he smacked his lips with evident surprise and pleasure, and declared it very good. It seemed to warm him up mentally as well as physically, seeing which, I plied him with questions regarding his illness and means of support,—questions which, notwithstanding the evident displeasure of his father, he an-

THE NURSE.

swered courteously and intelligently. Before my departure I put the room in order, and brought to the invalid and his father sufficient good food for a few days, and showed them how to prepare it.

"My next visit was to a little boy who had been run over while playing in the street. He was dead when I reached him, and his mother, worn out alike by mental and physical exhaustion, for she had not slept at all, and had eaten but little for several days, was lying moaning upon a bed. Another child lay in an adjoining room, quite ill with malarial fever. This is so prevalent among tenement-house children in warm weather, that we usually carry with us something to relieve them. So I did what I could for her, and then began to arrange the rooms and prepare the dinner. The mother appeared indifferent to what was taking place; but the father, a truck-driver by profession, who sat silent at the window, seemed much pleased with my efforts. The rooms were close and the atmosphere was permeated with bad air coming from the lower halls. The back windows looked into those of ill-kept, tumble-down structures across a court, the odors of which were alike offensive. The family clothes were suspended upon some of the ropes that formed a sort of cobweb between the adjoining buildings. They had remained hanging there for nearly a week, and after serving the dinner, I set about taking them in. This was no easy matter. While tugging upon the lines, they caught upon those belonging to the inmates of the other houses, and clogged up the pulley, and, before I had completed my labors, I had been roundly scolded for my awkwardness by the stout, red-faced occupants of the windows in the quadrangle. The cartman had been compelled to remain home and neglect his work for several days, in order to assist his wife. His money was almost gone in consequence,—at a time, too, when an unusual outlay was necessary. So I returned early the following day, and remained until the affairs of the household were again in smooth-running order.

"The most unsatisfactory visits we make are to those addicted to the use of intoxicating liquor. It was upon one of these I next called. In a little, dingy apartment in the wing of an old house which seemed to lean for support upon its neighbor, equally unsteady, I found a woman whose children I had nursed for weeks at a time. I had before seen her when under the influence of liquor, but now she seemed to be almost crazed with it. The children, ragged and dirty, were lying upon the floor, and, when I offered to look after them during her absence—for she was putting

on her bonnet—she almost flew at me, with taunts that I had abandoned her when she was starving. As a matter of fact, I had been with her upon the previous day."

Such is the work, such the experience of those of the training-school graduates who elect to exchange the comforts (often the luxuries) of home, and the society of friends, for the exposures and dangers incident to a life among the poor sick.

When the managers of the training-school announced, some years since, that they would send nurses to private families in cases of illness, the applications were so few that they were led to fear that this branch of the school would be unsupported, and that the nurses would find themselves deceived regarding their future prospects. But the value of the trained nurse, little known at that time in America, soon began to be recognized, and the demand for such services increased, until, at the present time, there is a greater call for nurses than can be supplied. Many who formerly refused to consider a suggestion to call in a nurse, now eagerly apply for them; and surgeons, in certain instances, have refused to perform operations without the subsequent assistance of a trained nurse.

Before going to a private house, the nurse is carefully instructed by the superintendent. She must not leave it without communicating with her, nor return from her duties without a certificate of conduct and efficiency from the family of the patient or the physician attending. She is expected and urged to bear in mind the importance of the situation, and to show, at all times, self-denial and forbearance. She must take upon herself the entire charge of the sick-room. Above all, she is charged to hold sacred any knowledge of its private affairs which she may acquire through her temporary connection with the household. She receives a stipulated sum for her services, but this will not always compensate her for the annoyances with which the position is occasionally beset.

In addition to this field in New York city and vicinity, there is an increasing demand throughout the country for experienced nurses to take charge of hospitals and schools. Graduates of the Bellevue school have been called to be superintendents of the nursing departments of the following institutions: Massachusetts General Hospital; Boston City Hospital; New Haven City Hospital; New York Hospital; Mt. Sinai Hospital, New York City; Brooklyn City Hospital; Cook County Hospital, Chicago; St. Luke's Hospital, Denver; Charity Hospital, New Orleans, and the Minneapolis (Minn.) Hospital. Others are matrons of Roosevelt Hospi-

New York City; Charleston (S. C.) Hospital; Lawrence (Mass.) Hospital, and the Seaman's Hospital, Savannah, Ga.

Thus has the great work set afoot by a few noble women of New York developed, little by little, amid difficulties of which it would be useless to complain, since all have been surmounted. The results have amply justified their conviction that a demand for efficient nurses would speedily follow their supply, and that American women could be found willing to nurse the pauper sick, provided they were at the same time assured of a competence. That the profession of trained nurse will rise in estimation as the value of her services becomes better known, there is little doubt. Other occupations than hers have successfully met and overcome prejudice. Less than two centuries ago, the English clergy were entertained in the servants' hall, were sent upon errands, and were expected to marry my lady's waiting-maid. It was later yet when the surgeon was separated from the barber, as that by no means ancient pile, the Barber-Surgeons' hall, still standing in London—may remind us. Against any such lingering prejudice the moral and professional character of the school will prove an ample defense. Founded in the belief that the value of a nurse is in proportion to her intelligence, capacity, and refinement, it has proved an important step forward in our civilization, and its standard is not likely to be lowered in order to make a show of graduates. During the nine years of its existence one hundred and forty-nine pupils have received diplomas, seventy-eight of whom are now practicing in New York city. Perhaps twice as many capable women have been

turned away because the school cannot be further enlarged until the financial support of the enterprise is more considerable than at present.

In conclusion it must be said that, while Miss Nightingale's theories are the basis of the Training-School, its managers have found it necessary to depart from the English system in some important particulars. For instance, Miss Nightingale regards it as indispensable that the superintendent and the nurses should live within the hospital. "Our experience is the reverse of this," say the committee. "American women, being of a sensitive, nervous organization, are at first depressed by the painful aspects of hospital life, and when they become interested in the work they take it greatly to heart. Hence it is of importance to have a cheerful, comfortable home where they can each day throw off the cares of their profession." To the restfulness of the Home is attributed the exceptional health of the nurses, among whom but one death and very few dangerous illnesses have occurred since the opening of the school, almost ten years ago. Another necessity in an American training-school is the abolition of caste. In England the "ward sister" (who has received thorough training) is expected to be a lady, superior in social position and intelligence to the nurses, who are drawn from the class of domestic servants. At Bellevue, the preliminary examination, and the high standard subsequently exacted, exclude, and are meant to exclude them. But among those who enter there is no distinction. All submit to the same discipline and perform the same duties, none of which, being connected with the sick, is considered menial.\*

*Franklin H. North.*

\* The introduction of trained nurses into county poor-houses is a natural sequence of their successful introduction into this hospital department of a city almshouse. In many poor-houses but little or no care is taken of the sick, one of the least disabled paupers usually being put in charge of those more seriously ill. Not in vain has the State Charities Aid Association called public attention to this state of things. The old barbarisms are passing away, and a new era is at hand. New York city wears the proud laurel of having first introduced trained nursing into a city almshouse, as Rensselaer County (Troy) leads the van of its introduction into a county poor-house. The authorities of this poor-house have recently engaged a graduate of the Bellevue School to take charge of the nursing department, and it is hoped that other counties of the State of New York may follow this humane example.

NURSE'S BADGE.

VIEW IN NEW ENGLAND WOODS. (ENGRAVED DIRECT FROM NATURE, BY ELBRIDGE KINGSLEY.)

## WOOD-ENGRAVING DIRECT FROM NATURE.

[At the request of the Editor, Mr. Kingsley has prepared the following brief account of his method of engraving the block on the opposite page, an experiment which is likely to lead to good results.]

IN Thomas Bewick the artist and engraver were combined. He selected the scenes he loved best, and wrought them out on the block in a manner individual to himself. That the engraver nowadays has no time for training and study as an artist may be the fault of no one but himself, and yet there are certain circumstances that force him to keep his position as an interpreter of other men's thoughts. But, if the engraver should wish to interpret his own thoughts, must he leave the profession in which he has been trained and turn to etching or painting? We believe not. His material is capable of expressing everything; every stroke of his graver will answer back from the smooth surface exactly as the hand impresses it, and the nerve-power flowing from the brain to the hand determines its quality. Wood, under the graver, is capable of the finest artistic expression.

During the last few years many methods of wood-engraving have been practiced, and many beautiful effects produced, in seeming defiance of the old methods, until the conclusion is forced upon the mind that the real vitality of any work does not consist in its method, but rather in the hiding of its construction altogether. The artist should forget his hand and his graver entirely, and give his mind fully to the thought to be expressed. Every kind of art-study has already been reproduced on wood. The mind and the hand that can produce quality, can express it with a piece of chalk on a cliff, or with a stick in the sand.

A description of how the engraving on the opposite page was produced involves, to some extent, its history. Camping alone in a New England wood, from the window of a car fitted up with every convenience for painting in oils, engraving on wood, and photographing whatever appealed to the fancy, I overlooked the scene before me and wrought it on my block. This was my first attempt to engrave direct from nature. The subject was photographed on the block in the beginning, but the photographic copy was of no assistance in getting the true values of tone and color. Most engravers use

a strong magnifying-glass, resting the block upon a sand-bag, and also using many gravers,—one kind for tints, one kind for figures, and another for ground, foliage, etc. This engraving was produced almost entirely with one graver, the block being held in the hand. For a part of the time I left the car, and, going out upon the scene itself, worked with the sunlight upon the block. This tends to force the mind away from finish in the mere execution; but there is sure to be a compensation in the greater breadth of the masses by the keeping of the whole under the eye at once, and, by a careful study of the refined portions of the scene at hand, a greater delicacy can be reached than can be found in a shining line under a magnifying-glass. There was necessarily much preparatory material belonging to the work, but nothing as a whole was photographed, nothing that would be recognized as such, and much was cut away of that which was traced at the outset, and other forms were drawn in with the graver as the work progressed. The leading thought was, to be faithful to the great masses and values, simplifying the form as much as possible. To hold the mind up to its first impressions required constant effort, and all the ordinary means employed in getting form and material were of no use whatever. It was a matter of simple feeling and nerve-power held up to their best level till the work was completed.

Hamerton, in his "Graphic Arts," while noticing favorably the work of American engravers, advances the idea that it is too difficult an undertaking to work direct from nature, because of the patience required. This is true only in part. More patience is required to plod away on a drawing that the engraver cares little for, and that he knows has not the life and power that it should have. Nerve-power and speed increase fourfold when the feelings are engaged and one is working on what he loves. It is useless for artists or engravers to copy one another. Let them study and train themselves as much as possible, and they will realize that in neither brush nor graver, but in themselves, in their personality, lies the power.

*Elbridge Kingsley.*

## THE CHRISTIAN LEAGUE OF CONNECTICUT.

BY WASHINGTON GLADDEN.

### I.

THE first of the many snow-storms that made memorable the winter of eighteen hundred and seventy-five had just fallen on the smooth roads of New Albion; a slight thaw with a following frost had polished up the sleighing, and two hearty-looking gentlemen, behind a powerful gray horse that needed no urging, were taking their first taste of the winter pastime. They seemed to be enjoying it, for, as they flew past the pedestrians toiling along the sidewalk, their faces shone, and their laughter rang merrily. The one who held the reins was a man of forty, smooth-shaven, but for a narrow, brown side-whisker; with a clear and fair skin, into which the stinging winter air was bringing a healthy crimson tint; a strong chin, a well-chiseled nose and brow, a blue eye, and a kindly smile. You would have guessed that he was a clergyman, and would have missed: he was the cashier and manager of the First National Bank of New Albion. The other was perhaps a little younger, with dark skin, full beard, and bright, black eye; his figure was slight, but well made, and he wore a gray ulster, and a seal-skin cap without a visor: a journalist, you would have said, or perhaps an artist, and would have been wrong again; for he was the Rev. Theodore Strong, pastor of the Second Congregational Church in the same thriving town. The cashier, Mr. Franklin, was his parishioner, and had been his college classmate; the old friendship had been the cause of the minister's location in his present pastorate, and was now one of its strong supports. Old Major, the good gray horse, had learned well the way to the parsonage, before which he used often to halt after banking hours; whence the parson, if he was to be had, was whirled away for a breezy hour or two on the country roads. These drives with his old friend were unadulterated recreation. It was a distinct understanding between them that the cares of the bank and the parish were always to be left behind.

"No shop, now, old fellow!" Franklin had said when he came for his friend the first time; "religion and business ought to be mixed sometimes, no doubt; but, for you and me, just now, rest is both business and religion."

To such a respite the hard-worked parson

was nothing loth, and the hours thus spent were full of the keenest delight. All anxieties being resolutely left behind, the minds of both friends were free to take in every fresh phase of roadside beauty, every new glory of sky or river or meadow. Other common pleasures they had in books and studies beyond the range of their work, of which they communed with much invigorating conversation; while, as each was a good story-teller, and sure to pick up a budget of mirthful anecdote, their discourse was plentifully spiced with fun.

It must not be inferred that the banker always refused to consult with the pastor about the parish work; on the contrary, he was his most trusted and judicious counselor; it was only that these hours of recreation were sacredly guarded from the intrusion of professional anxieties.

On this December afternoon the talk had ranged widely as usual, and had kept clear, as usual, of all work-day topics, when, suddenly, Mr. Strong, in a tone half apologetic, broke out:

"Ware, Walt! I'm coming perilously near to the Second Parish in my next remark—as near as Bradford."

"Twenty miles! Rather dangerous! Well, go ahead; but see that you keep your distance."

"The matter is this: Johns, of the East Church, in that metropolis, is trying to start a Congregational club, into which he wants to gather all of that ilk in this region,—representatives, at any rate, of all the principal churches; he has written me to come up to help him incubate the project. Shall I go?"

"Yes, go, and 'sit on it' hard."

"You are explicit, as usual. Now, tell me why. Don't you like Congregational clubs?"

"Never tried one. But clubs are generally wooden things. What is it proposed to do with this one?"

"Oh, there is to be a supper, of course, once a month; and a paper read by somebody after supper, and a discussion of the paper, and a general powwow after the discussion."

"Just so. Stuff, talk,—that's a club. But what special topics do you think this one will be most apt to light on?"

"Denominational topics, largely, of course: how to consolidate our churches; how to increase the *esprit du corps*; how to promote our various benevolent enterprises."

"Certainly. It is part of a movement to stiffen the last syllable of that sesquipedalian sectarian substantive, 'Congregationalism.' I do not like the name at all, and the sting in its tail, which it is now proposed to sharpen and harden, is the part I like least."

"There you go again," laughed the parson. "It's a downright insult when a man with such a horse as Major insists on riding a hobby."

"Oh, well," continued the banker, "there's nothing particularly sinful in this indulgence that the Bradford Congregationalists propose, doubtless the fellows who like to run things will enjoy it much, but I doubt if the outcome is valuable. There will be some increase of good-fellowship, and much burning of incense under the nose of the idol of the tribe. The more perfect the success of the club shall be, the further off will be the practical coöperation to which we must come at last."

"There is truth in what you say," answered the parson; "and I own that I am coming more and more to your way of thinking about such matters. But, when two ride a hobby, one must ride behind, and I am not yet quite so fierce a foe of the sects as you are."

For a few moments there was silence, broken only by the click of Major's hoofs upon the icy road, and the sigh of the wind through the pine-forest by the side of which they were driving.

"Look here, Theo," the banker at length continued, "couldn't we do a better thing?"

"Several things, no doubt. But what, for instance?"

"Couldn't we organize a Christian League Club here in New Albion?"

"Softly, softly, sir; you are breaking over bounds."

"I know I am; but you began it."

"And what was said, a few minutes ago, about clubs?"

"I remember; but there are clubs and clubs. This need not be a wooden one—indeed, it couldn't be; it would have to be made on a very pliable pattern."

"Show us how."

"The thing has no shape in my own mind yet; but why shouldn't we strike for a little practical Christian union in this town? We have enough of the sentimental sort, and bad enough it is. The union meetings of the week of prayer always bring out the prayer-meeting rounders,—men who have no standing in their own churches nor among their fellow-citizens; men like old Bill Snodgrass, who can reel off cant by the fathom, and whose word, in any business transaction, is as good as his bond only because neither of them is worth a row of pins. There never is a union

meeting in which Bill doesn't exalt his horn at least twice. Then there is young Cyrus Smiley, the effusive and irrepressible, and Tom Trafton, the censorious sputterer, whose prayers are mainly digs at the ministers."

"I know it," broke in Mr. Strong, greatly amused at the vivid characterization of his friend. "But have you heard Trafton's last on his own pastor?"

"No; what was it?"

"Dr. Sampson told me the story himself. You know that Tom has taken a special dislike to the Doctor, and betrays it in all his prayers. The other night, in the prayer-meeting, he said in his jerky way: 'O Lord, grant that our temp'r'l food may not be so skerse and poor as the spiritooal food provided for us; for ef it is, we sh'll all be in the poor-house within six months.'"

Franklin laughed.

"Tom outdid himself that time. Think of letting such a creature loose in a prayer-meeting! But that is the sort of person that revels in union meetings. At home he can be suppressed, at least in part; but a joint service of the churches gives him vent. So that, practically, our attempt at Christian union consists mainly in meeting together a few times a year, to be rasped and disgusted by these persons who put themselves forward as the representatives of our common Protestantism. Now, I wonder whether some plan could not be devised by which the real people in our churches could be brought into working union, and the flood-trash kept out."

"Yes, that's the question. But you don't seem to get ahead very fast in answering it."

"Patience, patience, young man! We'll work this thing out, but it will take time. The fact is, New Albion is an excellent place to start such an experiment. The relations between the churches are amicable; there has been no unnecessary multiplication of religious societies as yet; there are no churches here that ought to be killed, except one or two colored churches; the population is intelligent, the ministers are all good friends; the thing can be done."

"Undoubtedly, my eloquent friend; but, what thing?"

"We can have a meeting, from time to time, of the ministers and certain representative men of the various churches, to consult about the interests of morality and religion in this community. That's the dry bones of it."

"The next question is how to make these dry bones live."

"Yes, and you must help me solve that. Your practical tact and skill in managing people come in play just here."

"Thank you! I wish devoutly that something of the sort could be brought about, and I will do my best to devise a feasible way of accomplishing it. But it must be managed cautiously. Don't flush your game!"

Old Major had arrived at the parsonage, and the parson dismounted, with a promise to give the matter of which they had been talking early and full attention.

## II.

THE problem which we have seen the banker and the parson getting ready to attack is a knotty and an urgent one. How to bring the Christian churches of our country into practical unity: this is a question round about which a great deal of talk has been going on, but to the careful consideration of which but few minds have been turned. All the discussion has vibrated between two points: the desirableness of a spiritual fellowship among denominations, and the feasibility of an organic union of the denominations. A great multitude agree in saying that the sects ought to dwell together in unity,—that is to say, that the ministers ought to exchange pulpits, and that members ought to pass freely by letter from one church to another, and that Christians ought to meet now and then in union meetings, and say pleasant things in their prayers and speeches about one another, and sing together,

"Blest be the tie that binds,"

and so on. So much of Christian union as this nearly everybody believes in. The more strenuous sectarians stick at some of these points, but not very persistently; to refuse this much involves some measure of opprobrium. But there are many who insist that, while Christian union may have this extent, it can have no more; that it is vain, and, indeed, rather sacrilegious to ask for anything beyond this. Others declare that this sentimental union is of no value; that what we want and must have is organic union, a consolidation of all the sects into one church, so that Protestantism shall stand over against Romanism, compact and united, all under one central government, moving with well-ordered and harmonious march to the conquest of the world. These two conceptions have divided between them the debaters about Christian unity; and it must be owned that each side brings against the other arguments that are well-nigh unanswerable. The believers in what is called spiritual unity insist that the organic unity asked for is impossible;

the believers in organic unity declare that spiritual unity, as it now exists, is of very little consequence.

Some abatement of these extreme views must, indeed, be made on both sides. The measure of unity to which the churches have already attained is by no means to be despised: their relations are vastly better than they were forty years ago, when Presbyterians or Congregationalists had no more dealings with Methodists or Baptists than the Jews once had with the Samaritans, when keen contempt and bitter abuse were common currency among the sects. It is not a slight, but an important gain, that Christians of all names are able now to meet together on friendly terms in social worship. On the other side, it is too much to say that the dream of the church existing as one compact body can never be realized. Stranger things than that have come to pass. The truth lies about midway between these disputants. The spiritual unity to which we have attained, though not worthless, is ridiculously inadequate to the present needs of the Church; and the organic unity for which we are exhorted to labor, though it may not be impossible, is yet a long way off. Is there not, somewhere between the emotional fellowship of the present and the organized ecclesiasticism of the future, a measure of coöperation that is both desirable and attainable? This was the problem to which the practical mind of Mr. Walter Franklin had turned. He was a man, as his pastor well knew, who had a way of bringing things to pass; and Mr. Strong was not therefore surprised, at the close of the next Sunday evening's service, to be joined at the church-door by his friend, with an ominous gleam of speculation in his eyes.

"Pretty well used up to-night, Theo?" he queried. The Romans knew how to convey more delicately the hope of a negative answer.

"Not at all," said the minister, who never knew on Sunday night how tired he was. "Fresh as a lark. Come home with me, and we'll have it out."

"Have what out?"

"That matter that you're eager to talk about. You have done bravely in keeping away till the Sunday work was over, and I haven't the heart to put you off any longer. Come on."

"Seems to me I have detected a few delicate allusions to it in sermons and prayers to-day. Your mind's as full of it as mine is, dissembler! And I am only going over with you to find out your plans."

"Well," said the parson, as he let his friend in at the door of the parsonage, "it has been

on my mind now and then, I own. And the place to begin is Jerusalem. I saw Dr. Phelps last week, and, in talking about church sociables and so forth, I asked him why the Old Church did not sometimes invite their neighbors to their festivities? He took me up at once, of course, and told me very cordially to come over to their sociable on Tuesday evening, and to bring along a good delegation of the Second Church people. I replied that it was rather hard to be obliged to beg an invitation; but that I should pocket my humiliation and go, which seemed to please the old gentleman mightily. So I want you and your wife, and Deacon Hunter and his wife, and Shaw and his mother, and the Burnham girls, and a few others—a dozen or fifteen of our wide-awake people—to meet here on Tuesday night, and we will go over in a body and take 'em by storm."

"Capital!" exclaimed Franklin. "The church sociable is one of the strongholds of sectarian exclusiveness; if we can capture that and turn its guns upon the enemy, one great point will be gained."

"There is no need of despising the church sociable," replied the minister. "It serves a good purpose, and is no more accountable than the Church itself for 'sectarian exclusiveness.' Human nature is to blame for that, not the Church, nor the sociable."

"But I am not talking about remote causes," persisted the banker. "What I see is this: the church sociables in most of our villages and large towns cut up society into cliques. Active and zealous church-members find but little time for the cultivation of social relations beyond the bounds of their own parishes. I have heard it said, more than once, by intelligent citizens, that there is not much general social intercourse among the best people of this town, and that the fault lies at the doors of the churches. The First Church people are a set by themselves, and so are the Second Church people, and the Episcopalians, and the Baptists, and all the rest. The devotion of the church-members to their own societies hinders the development of a broad social life."

"That is true," answered Strong, "and there is something here to regret, beyond question. Nevertheless, there are compensations, which you, Walter Franklin, must not overlook. If the churches have somewhat hindered the cultivated classes outside of the large cities from consorting together, they have also helped to bring together the cultivated and the uncultivated classes, and that is one of the things that most need to be done. They have substituted vertical lines of division in society for horizontal ones. Bad as the church cliques are, they are not so bad

as the stratifications of social æstheticism. But I am not defending social exclusiveness in the churches; I am trying to overcome it, as a step toward something higher."

"You are perfectly right, and you may count on me. We will be on hand Tuesday evening. Good-night!"

It was a merry company that followed Mr. Strong into the parlors of the First Church; and though they were received at first with polite bewilderment, it was not long before hospitality and good-fellowship asserted themselves in the heartiest fashion. The hosts exerted themselves to entertain their guests, voted the innovation a delightful one, and promised to return the visit. This was the beginning of a series of fraternizations among the churches of New Albion; none were neglected; the Adventists, who worshipped in Central Hall, and the two colored churches, were surprised in their turn by visiting delegations from the other churches that dropped in at their prayer-meetings, and stopped afterward to shake hands, and to say a few pleasant words. So far as it could be done socially, the ecclesiastical *entente cordiale* was fairly established in this prosperous town.

All this was so much of the nature of a recreation, that the banker and his friend excepted it from the list of forbidden subjects, and often chanted the praises of Christian fraternity to the music of Major's sleigh-bells.

"It is all excellent, so far as it goes," said the banker one day in January; "but I want to see the thing put on a business basis. The improvement in the social relations of the churches is a great gain; it signifies vastly more to have the people meet in this friendly way, and show each other neighborly courtesies, than to have them talk the cant of Christian union now and then in a prayer-meeting—but it is not enough. We want some method by which this fraternity shall have a distinct and influential expression."

"Exactly," answered the parson; "we have been getting up steam; now we want to utilize our power. How shall we do it?"

"I thought you were managing the business," replied Franklin; "but, since you ask the question, I'll give you my idea. Let us have a little party at my house some evening, including the ministers and about three of the best members of each church, and see what comes of it."

"How shall the three best members of each church be chosen?"

"We must choose them ourselves. We know this community well enough to pick our men."

The preparation of this list was not, however, an easy matter, as the banker and his

pastor found. Mr. Franklin's knowledge of the business standing of the "leading members" served to thin out Mr. Strong's ample catalogue of nominees.

"Rodney Merrill? Yes; he's a good talker, but his word doesn't stand for much. Better put young Porter, the carpenter, in his place. Stevenson? H'm! He's a customer of mine; but I don't like his way of doing business. Montgomery? I've got some memoranda on Montgomery. He failed not long ago; and not ten days before the collapse he borrowed a thousand dollars at our bank, solemnly assuring me that he had not less than twenty thousand dollars in available assets, and not more than five thousand dollars of debts. The inventory showed that his figures were exactly right, only the debts were twenty thousand, and the assets five. It was a mere slip of the tongue, no doubt; but we'll pass Montgomery. This company must be a clean one, and there is no lack of sound and reputable men in our churches."

"How about the colored brethren?" queried Mr. Strong.

"The colored brethren must be left out," was the answer; "not for social, but for ecclesiastical reasons. One of the first duties of this league of ours, if it ever gets into operation, will be the suppression of these colored churches. When the colored people abandon their own organizations, and join the other churches, they may come in as representatives from them. We will have no color-line in the Christianity for which this club stands. I'll go as far as any other man in fraternizing with colored men; but, with colored churches, never. The sectarianism whose only basis is the color of the skin is the meanest kind of sectarianism."

### III.

OUT of the thirty-two persons invited, thirty, representing all of the eight churches of New Albion, gathered in Mr. Franklin's parlors on the sixteenth of January. The clergymen were all present, and the absentees were not conspicuous. Tea was served in the parlors, and Mr. Franklin was amused to see how completely sectarian lines were blotted out in the grouping of the guests about the small tables. To the eye of the social devotee it would have seemed, no doubt, a mixed multitude—people of all grades of society were here; but the hospitality was so frank and hearty, and the entertainment of such a simple sort, that the humblest people were at their ease. And what was of more consequence, these people were all known to one another as being engaged in various

kinds of benevolent work in the community; the *cameraderie* of Christian service was a stronger bond than that by which most social circles are drawn together. Dr. Emmons Hopkins Phelps, the venerable and well-beloved pastor of the "First Church of Christ in New Albion," was *tête-à-tête* with the Rev. Murray Henderson, the young pastor of the Universalists; Dr. Thomas Sampson, the stalwart wit and excellent scholar, who adorned the pulpit of the Baptist Church, was cheek by jowl with the genial Dr. Philip Strickland, of St. Mark's Episcopal Church; and here and there Congregational deacons were sandwiched between Episcopal vestrymen and Methodist stewards.

"What are you going to do with your happy family when you get them trained?" asked the Rev. John Wesley Thorpe, Methodist, of the beaming host.

"Travel with 'em," was the prompt answer. "Take 'em up to Hardscrabble, and West Northfield, and over to Hockset, and show 'em to the natives for ten cents admission, the proceeds to be divided equally among the home missionary societies of the several denominations."

"Such a show would be a great curiosity in those parts, no doubt," said the clergyman. "But, my friend Peters, here, thinks that the saints in Hardscrabble would be horrified to see Dr. Phelps eating and drinking with a Universalist."

"It is somewhat bewildering, I own," replied the banker. "But I think that, when they looked into Henderson's face, they could say nothing against it. Look at him now! It's a face for Raphael."

"Solar radiance, is n't it?" responded Peters. "And the man is as saintly as he looks. His church is growing in all the graces a great deal faster than mine is. I wish the Free Baptists had half as good a minister."

"What do you imagine that your bishop would do, if he were to look in upon this company?" asked Dr. Sampson of Dr. Strickland.

"I imagine," was the answer, "that he would go straight to Dr. Buck, the editor of your *Inquisitor*, and tell him all about it."

"Very likely," laughed the Baptist. "And probably the two would sit down and have a pleasant chat over it. Each one would try to make out that the people of his communion were a little nearer ready for fellowship than those of the other."

"Oh, of course! But I should like to know what Franklin has got in his head. He has not invited this carefully selected company for merely social purposes, you may depend. He means business."

"Well," answered Dr. Sampson, glancing about the room, "he will not be able to carry this company into any very wild scheme. It is a pretty solid set of men, Mr. Strickland—about as good as New Albion contains, that's a fact. A set of men," the Doctor went on, after a pause, "who, if they should put their heads and hands together, could give the old Adversary a great deal of trouble."

The company was not left long in doubt as to the plans of the host. Half an hour after supper, Mr. Franklin rose, and there was silence.

"I have called you together this evening, gentlemen," he said, "to consult about a matter of importance. The unity of feeling now existing among the religious societies of this town is gratifying, and it has occurred to me that out of it something might grow that should be for the permanent good of the community. We have learned to treat each other courteously in social intercourse; can we not work together? The Christian work of this town is imperfectly done, because what is everybody's business is nobody's. The churchless classes are not reached; the poor are neglected; pauperism thrives upon our careless and indiscriminate charity. Could we not, by meeting occasionally for consultation about this work, secure a much more thorough performance of it? There is much flagrant vice in our streets; hundreds of our young people are being led into temptation and destroyed. Could we not, by combining our efforts, secure a more vigorous enforcement of the laws for the suppression of vice, and set on foot some effective movement for the rescue and reclamation of these young men and women. Furthermore, the good feeling now existing among us is likely to be disturbed at no distant day. The town is growing rapidly; other religious organizations will be needed; strife may arise among the denominations for the occupancy of new fields. Is it not possible for a band of Christian men, representing all the churches, to exert an influence which shall lead to the amicable adjustment of all such questions? I am sure that there is not a man in this company who would not at once put the interests of religion and morality in this community above the interests of the sect to which he belongs. If this is true, then we can, if we choose, make it the rule in New Albion that all Christian work shall be prosecuted, not on the worldly principle of competition, but on the Christian principle of coöperation. Is not this worth attempting? In order to bring the matter to a point at once, I will read you a draft of a plan of operation prepared by my friend, Dr. Strong, and myself:

#### "CONSTITUTION.

"1. This organization shall be known as The Christian League Club of New Albion. It shall consist of the minister and three laymen from each of the following churches of this town: Adventist, Baptist, First and Second Congregational, Free Baptist, Methodist Episcopal, Protestant Episcopal, and Universalist; delegations from other churches hereafter formed may be admitted by unanimous consent.

"2. The object of this organization shall be to hold stated meetings for consultation respecting the Christian work to be done in New Albion and its suburbs, and the best methods of accomplishing this work. The visitation and evangelization of the churchless classes, the distribution of Bibles and of good literature, the establishment of new missions when needed, the care of the poor, the prevention of vice and crime by the enforcement of the laws, the opening of coffee-rooms, reading-rooms, and other safe places of resort, the furnishing of cheap and wholesome diversion for the young—these subjects and such as these will be matter of consultation at the meetings of this club.

"3. The members of this club shall never be required to assent to any creed or confession of faith, nor shall doctrinal or theological discussions of any kind ever be allowed in its meetings. The club shall assume no authority over its members or over the churches, and, to guard against any such encroachments, it shall never vote on any question. Committees may be appointed by the chairman, at any meeting, to carry out the views of the club; but no such committee shall be appointed without unanimous consent of the members of the club.

"4. Meetings shall be held on the first Monday evening of every month, at the houses of the members, by invitation. The member at whose house the meeting is held shall preside. No records shall be kept, and the club shall have no permanent officers.

"5. When a vacancy occurs in the lay delegation of any church, it shall be filled on nomination by the pastors of the other churches, who shall constitute a committee for that purpose. No pastor shall have any voice in the nomination of delegates from his own church; and no name shall be reported by the committee of pastors on which they are not unanimous. If no objection is made to the name thus reported, the nominee shall be notified of his election."

"This sketch of a plan of organization," continued Mr. Franklin, as he folded the paper, "brings before you, as distinctly as I am able to do it, the thought in my own mind. I will not make any further remarks about it. I hope that, in the free conversation that may follow, the wisdom of the scheme will be freely canvassed, and its defects, if defects there be, will be pointed out."

The company had listened with an absorbed and rather anxious attention to the banker's speech. At its close the only response was a rather ostentatious sigh of relief by Mr. Strickland, whereupon the whole assembly broke out laughing.

"Not quite so bad as you feared, eh?" said Dr. Sampson.

"N-no," replied the other, meditatively; "I don't yet see how such an institution could do any particular mischief."

"Its hands would be so effectually tied," said Mr. Thorpe, "that it could do no mischief; but are they not so effectually tied that it could not do much good?"

"How so?" asked Mr. Strong.

"Well, the provisions about voting and keeping records, for instance; I don't see how an association forbidden to vote can effect much."

"But we do not vote in prayer-meetings or sociables," responded Mr. Strong; "are not they of some service? Would not frank and frequent conferences about the state of religion and morals in this town be instructive and stimulating, even if we took no votes?"

"Perhaps so," answered the Methodist pastor.

"The truth is," said Dr. Sampson, with much energy, "that this voting business is more often a snare than a help in all sorts of organizations. A vote is simply an expression of will, and the tendency to put will in the place of reason and love is the bane of all ecclesiasticism."

"But you believe in the rule of the majority, do you not?" queried Deacon Squires, of the First Church.

"No, I don't. I submit to it, because it is practically the best thing to do, and sometimes the only thing that can be done. But the principle that the majority shall *rule* implies a division of sentiment that ought always, in religious work, to be avoided, if possible. The less we have in our Christian assemblies of ruling and of being ruled, the better."

"But the minority ought to be expected to coöperate," suggested Mr. Peters.

"Certainly," answered Dr. Sampson, "and they ought to coöperate. But, if half the energy that is expended in voting people down were expended in conciliating and persuading them, we should have fewer church quarrels and fewer disaffected and sullen minorities. It is a favorite superstition of this age that nothing can be done without a vote, whereas very little that is of permanent value is ever done by voting."

"It is clear," said Dr. Phelps, quietly, "that such a body of men as this would be must jealously guard itself against the assumption of ecclesiastical power. Perhaps the denial of a vote is none too stringent a safeguard against this danger."

"Well, I don't object to it," answered Mr. Thorpe. "I can see that such a club might do

some good work without voting, and it would surely avoid some dangers."

"But why not let the minister have some voice in selecting the delegates from his own church?" asked the Baptist Deacon Jones.

"That," answered Mr. Franklin, "simply relieves the minister of a delicate responsibility, in the exercise of which he might cause disaffection in his own church."

"But why not let the church choose its own representatives?" asked Elder Bates, of the Adventists.

"Because," answered Mr. Strong, "that would give to this body an official and representative character, which we do not wish to have it possess. By and by the churches of this city may be ready to delegate to a body representing them some supervisory powers; they are not yet ready to do any such thing, and we want nothing, therefore, that looks like it."

"I have a little misgiving," suggested Mr. Henderson, "as to the wisdom of a select and exclusive organization like this? Why not have an open meeting once a month for such purposes—a meeting called from all the pulpits, and open to all?"

"Don't!" cried Dr. Sampson, amid the laughter of the company. "The cranks and blatherskites of all the churches would be there in force, and the knowledge that they would be there would keep all the sensible folks away."

"I surrender!" said the Universalist pastor, good-naturedly. "You know, brethren, that my experience in union meetings is somewhat limited."

"Well," said the Methodist minister, after a short pause, "the plan seems to meet with general favor, and, in order to test the sense of this meeting, I move you, sir,—no, I beg pardon—I take it all back; go ahead, Mr. Franklin!"

And the parson sat down, laughing with the rest at his own blunder.

"The shape in which the matter lies," said the banker, "is just this: Here are the pastors of the eight churches named in the constitution, and three laymen from each of them, with one vacancy in the lay delegation from the Baptist Church, and one from the Episcopal Church. I propose that, if there is no objection, the persons here present constitute The Christian League Club of New Albion. There will be two vacancies, and these may be filled according to the constitution. I will wait a few moments for objections."

No voices were heard, and Mr. Franklin proceeded: "The consent is complete, and we may regard the club as organized. It is, gentlemen, a most gratifying result. What

will be accomplished we will not venture to predict; but I have faith enough in the common sense and Christian spirit of this body of men to believe that they can talk frankly and earnestly about Christian work in this town without getting into any disputes, and that they will be ready to put the interests of virtue and religion above their private preferences or their sectarian prejudices. If such a temper and purpose shall rule in all our meetings, I am sure that public opinion will be wisely directed and that substantial results will follow."

All formalities were now at an end, and promiscuous conversation followed. Mr. Franklin was too wise to introduce any questions for discussion at this meeting; he preferred to let the members of the club work up their own questions.

The talk that ensued was full of suggestions: these energetic, clear-headed business men took hold of the problem put into their hands with the grip of their trained faculty, and it did not take them long to find out that the business of doing good in their community had been carried on in a negligent, perverse, and wasteful fashion, and that there was plenty of room for the introduction of better methods. One thing and another were spoken of as possible and desirable, by the various groups that were exercising their wits upon the problem, and difference of opinion began to be developed at once; but these differences engendered no heat. The need of perfect good nature was evident, at once, to all who had any points to carry. Inasmuch as nothing could be done in this club without unanimous consent, it would never do to irritate anybody. Fair consideration, and entire recognition of the right of others to hold contrary opinions, must be the basis of all these conferences. This was a warfare in which nothing but sweet reasonableness could win.

At ten o'clock the company dispersed, having accepted Doctor Sampson's invitation to hold the next meeting at his house, on the first Monday evening in February.

#### IV.

How to reach and help the churchless classes was the question that received the most attention in the free talk of the members of the Christian League Club at their first meeting; the topic had been upon the minds of many of them during the interval, and it was sure to be prominent among the themes of the second conference.

"It is plain," said Deacon Squires, after

the company had settled down to business in the cozy parlors of Doctor Sampson, "that there are large numbers of persons in this community wholly outside of all religious influences. Those who attend our churches every Sunday constitute a small part of our population. Sunday before last was a beautiful winter's day, and the congregations were, as I have been told, unusually large in all the churches. On that day, to satisfy myself, I had a careful count made of all the congregations, and here are the figures. I will not read them, but the total number of persons present on that Sunday morning was two thousand seven hundred and sixty-nine. Out of a population of twelve thousand, this is not a good showing. Something must be done, or we shall lapse into heathenism."

"That showing," replied the chairman, "is rather discouraging on the face of it; but let us see if it will not look better after a little examination. Out of the twelve thousand people living in this town, at least three thousand are Roman Catholics. The great majority of these attend church. This leaves nine thousand to divide among the Protestant churches. Will Deacon Squires kindly tell us how many there were in the congregation at the Baptist Church, Sunday before last? I do not care to number my neighbors, but I am willing to have my own flock counted."

"Five hundred and seventy-six," answered the Deacon.

"That is about what I had supposed," said the chairman. "Now, our Sunday-school in the afternoon numbers fully four hundred, and at least half of these were not at the morning service. At the evening meeting I am sure that we often have at least a hundred who have not attended either of the other services. During that Sunday we must, therefore, have had in our church nearly nine hundred different persons belonging to our parish, besides strangers and sojourners. You would need to add fifty, and, I think, in many cases, sixty per cent. to the morning congregation, to get the number of persons reached by the churches on any given Sunday."

"And that," said Mr. Franklin, "would bring the figures up to between four and five thousand actually present in our Protestant churches on a pleasant Sunday."

"Yes, that is about what I calculated—nearly half of all the Protestants in town get to church at least once on a fair day."

"But that," said Deacon Jones, "is not a good story to tell. More than half of all the Protestants in town *stay away* from church every fair Sunday. Put it that way, and how does it sound?"

"But that," continued Doctor Sampson, "needs further explanation. A large share of all these Protestants are unable to attend church on any given Sunday. Add together all the children under four years old, the aged and infirm, the sick, and all those who must stay at home to attend upon these, and you will have, according to some careful English estimates, about forty per cent. of the population. Suppose, now, that forty-five per cent. of the people actually attend church, and that forty per cent. are providentially kept away: you have not more than fifteen per cent. of the population who are, both by choice and by habit, neglecters; and the careful canvass that our church has made, of a section of the town that is fairly representative of the whole, leads me to the same conclusion. I do not believe that more than fifteen or twenty per cent. of our people can be counted among those who are outside of all the churches. I happen to know, for example, how many souls are in my parish. I have tried to get the names of all, old and young, who are under my pastoral care—all the members of all the households connected with my church and Sunday-school, and not connected with any other church, and the list numbers about fourteen hundred names. Many of these are persons who do not often attend Sunday service—they are semi-attached parishioners; but, if you should ask them where they go to church, they would mention the Baptist Church. They consider me their pastor, and would send for me if they needed the services of a clergyman. So that the actual members of my parish who are cared for, in some sort, by my church, number considerably more than twice as many as my congregation number on a pleasant Sunday morning. If this is true of all the other churches, and it undoubtedly is, then there must be in the neighborhood of seven thousand persons connected more or less closely with our Protestant parishes. At the outside, I do not think there can be more than two thousand persons in this town who are not, in some imperfect way, cared for by our churches, either Catholic or Protestant."

"That puts a different face upon the question," said Deacon Squires, "and I am glad to have the subject so carefully analyzed. But two thousand heathen are too many."

"Most true," cried Dr. Sampson, "and it is a shame to our churches that there are so many. It is well to have distinct ideas of the work we are trying to do, and not to exaggerate its magnitude, lest we be discouraged. This whole subject has been greatly obscured by a number of shallow alarmists, who have been croaking about the desertion of the

churches, and who have wholly failed to comprehend the real facts. But, if the real facts are not half so black as they have been painted, they are somber enough, and it is high time that we were grappling with the problem they present."

"What to do about it is the question," said Mr. Franklin.

"Why not send for an evangelist?" modestly queried Elder Bates, of the Advent Church. "Brother Moody is not to be had this winter; but we might get Brother Weeks. He is said to be a powerful preacher—abler even than Moody; and he might succeed in drawing in some of these neglecters."

"Drawing them into what?" asked Mr. Franklin.

"Why, into his meetings. I suppose that they would be held in the Town Hall, and many would be drawn in who do not attend the churches."

"Doubtless; and they would attend the churches no more after Mr. Weeks had gone away than they did before. A few would join the churches, but the proclamation thus made of the inadequacy of the churches to supply the religious wants of the community would do these outsiders, as a class, an amount of harm for which these small gains would poorly compensate. Building a fire in the Town Hall is a poor way of warming the churches."

Mr. Franklin spoke very quietly, but with the earnestness of strong conviction, and the only response was a fervent "Amen" from Doctor Phelps. It was plain that the project was not popular, and good Elder Bates forbore to press it.

"Couldn't we do something with mission Sunday-schools?" suggested one of the Methodist laymen.

"Where would you put them?" asked Mr. Strong.

"Oh, I don't know; good places might be found, I should think."

"Down on the corner of King and Patterson streets is a good location," said Mr. Thorpe.

"That is about fifty rods from the Free Baptist Church," answered Mr. Strong. "Do you want any help down that way, Peters?"

"I fear," said the genial parson, "that we are not doing all the work we ought to do; but there is still a little room left in our vestry for new scholars."

"Beg your pardon, Peters," cried the Methodist. "I didn't intend to poach on your preserves; I was only thinking of doing good on general principles."

"We must be careful to make our general principles fit the special cases with which we have to deal," said Doctor Sampson.

"I am unable," said Mr. Strong, "to think of any neighborhood in which a mission school could be started that is not now within reach of some existing church. Round the new brass-works now building, in the south part of the town, a settlement is likely to spring up that will soon need to be provided for; at present every locality is well furnished with churches."

"But," said Deacon Squires, "people will often attend mission chapels who would not attend churches."

"The first thing to do in such a case," replied Mr. Strong with emphasis, "is to convert or kill the churches of which this is true. A church into which poor people cannot be induced to go ought to be born again or blotted out. The church whose methods of administration and whose social atmosphere are such as to discourage the attendance of the poor, is driving Christ from its door. Is not this his own word, 'Inasmuch as ye did it unto one of the least of these, ye did it unto me'? It is entirely possible to create and maintain in our churches a spirit and a way of working that shall make the poorest people feel perfectly at home in them. The church in which these are not found needs a missionary as much as the Patagonians do. It has not yet learned the alphabet of Christianity."

"You wax warm, Brother Strong," cried Doctor Sampson. "Haven't you got a missionary or two up at the Second Church, that you can send to some of your neighbors?"

"Not one. We need them all," answered the parson, laughing. "But I suspect that I have already scattered abroad a few, to whom my doctrine on this subject was too hot, and who have gone forth preaching quite another gospel. Whatever help you can get out of them you are welcome to. Good riddance to them, I say. One or two of them have taken refuge with you, Strickland. I hope you will convert them."

"I'll do my best to convict them, at any rate," said the rector, warmly. "If they expected to hear a softer doctrine on this subject at St. Mark's, they have probably found out their mistake by this time. Our practice is not quite up to our theories, but I am happy to say that the spirit of a genuine Christian democracy is growing among our ecclesiastical aristocrats. The churches are not few in which the poor are coddled or patronized; those in which they are respected and frankly put upon the same level of consideration and responsibility with the rich and well-to-do are not yet a multitude. This is our standard, and, although we have not reached it, we shall not lower it, please God, under the present administration."

"This discourse is edifying," said Mr. Peters. "Go right on, brethren. It is good to hear such testimony from the pastors of such churches."

"We sometimes hear of 'a saying hard to shape in act,'" said Doctor Phelps, "and this is one of them. The theory is sound; but, whenever thought is wedded to fact, there will be a bridal dawn of grumbling, if nothing worse, in some of our congregations."

"The more shame to us," cried Mr. Strong, "if we have suffered our people to forget the true function of the Christian Church, and have allowed the fellowship of the Spirit to degenerate into a chartered snobbery."

"But," said Mr. Thorpe, "is it not wiser to recognize existing facts, and adapt our methods to them? It is certainly a fact that the poor people generally think they are not wanted in the churches. They greatly exaggerate this inhospitality; in many of our churches they would find a cordial welcome; but they think that the place where the rich and the stylish people worship is not the place for them. Many of those who stay away from the churches could be gathered into mission chapels. Is it not better to reach them in this way than fail altogether to reach them?"

"I think not," was the answer. "The one injurious and fatal fact of our present church-work is the barrier between the churches and the poorest classes. The first thing for us to do is to demolish this barrier. The impression is abroad among the poor that they are not wanted in the churches. This impression is either correct or incorrect. If it is correct, then there is no missionary work, for us who are pastors, half so urgent as the conversion of our congregations to Christianity. If it is incorrect, we are still guilty before God in that we have allowed such an impression to go abroad; and we are bound to address ourselves, at once and with all diligence, to the business of convincing the poor people that they are wanted, and will be made welcome, in the churches. But every mission chapel planted in the neighborhood of a church, and intended for the poor, is an ostentatious proclamation to the poor that they are right in their impression; that we freely consent to the separation of the rich from the poor in worship; that we approve of the religion that is founded upon caste. To that proclamation I will never put my signature. The time has come when judgment should begin at the house of God, and when the paganism that masquerades in our stylish churches, in the guise of Christianity, should be stripped of its disguises and banished from our altars."

Mr. Strong had risen from his seat, and his

black eyes were blazing with the intensity of his convictions, as he finished his speech. A round of applause greeted his peroration. It was clear that no progress could be made by the club in the erection of mission chapels until some population not accessible to the churches could be found.

"Well, gentlemen," said the genial chairman, "the question is before you. What will you do for the churchless classes,—be they few or many, rich or poor?"

"Would it not be wise," asked Mr. Henderson, "to have the town divided into geographical districts, as many as there are churches, each of which should be assigned to a church for its special field? It would not be possible to have each church stand in the center of its field, for some of our churches are too near neighbors; but we might come as near to that as possible. If every part of the town was thus under the care of some church responsible for its evangelization, our work would be well begun. Each church could do the work in its own district in its own way."

"That is a sensible suggestion," said Mr. Franklin. "I move"—

"Order!" cried the Methodist parson. "Physician, heal thyself!"

"Peccavi!" exclaimed the banker. "The forensic habit survives, as you see, in the millennium of the Christian League. But we have one resource. A committee can be appointed by unanimous consent. I trust that such consent will be given to the appointment by our chairman of a committee of three, who shall carefully divide the town into districts, assigning one to each church; and that this committee may report at the next meeting."

To this proposition no objection was made, and the chairman at once named as the committee Mr. Franklin, Mr. Henderson, and Deacon Squires.

The work of the committee was done before the next meeting. The population of New Albion was distributed, as it is in most similar towns, in such a way that it was possible, in the words of Deacon Squires, to give each church "a streak of lean and a streak of fat,"—to assign to each a district in which there were sections inhabited by the poor, as well as those inhabited by the well-to-do. When the assignment was made, it was at once reported by the pastors to the churches. The knowledge that a systematic and concerted effort was to be made to reach

all classes in the community stimulated each church to do its own part of the work promptly and thoroughly. So it came about that, before the winter was over, the whole town had been covered by the canvassers, and no household was left in ignorance of the fact that a place and a welcome were waiting for it in one of the churches.

Some of the canvassers carried with them cards on which were printed the hours of their various services. The spirit of goodwill and coöperation was such that the visitors generally sought to gratify the denominational preferences of those on whom they called. If a Congregational visitor found a family with Baptist proclivities, he sent the address of this family to the nearest Baptist visitor. In this way the poor people obtained a strong impression of the unity of the churches. It became evident that this enterprise was not undertaken for the aggrandizement of any sect or of any local church, but rather for the sake of carrying the gospel greeting and invitation to all the destitute. Many cases of sickness and want were also discovered by the visitors, and the practical charities of the churches began to be developed in an effective way. A colporter of the Bible Society appeared upon the scene as the work was beginning, himself proposing to canvass the town in the interest of his society; but he was easily persuaded to relinquish the work into the hands of the local visitors.

"Well," said the parson to the banker, as they drove slowly along a forest road, on a bright May afternoon, drinking in the aromatic breath of the newly opened leaves, "the weather has considerably moderated since that day last January, when we were passing this spot, and when you suggested the formation of our club."

"Yes, and I think the ecclesiastical climate has softened a little."

"Not a little. The outcome has been wonderful. The results are far greater than I ever dreamed of. There is really a great deal of good-will among men, if it can only get a chance to express itself."

"We will give it plenty of chances. This work is only fairly begun. There is abundance of work to do better than any we yet have done. And we shall do it. The Christians of New Albion have got a taste of the luxury of Christian coöperation, and they will never go back to the beggarly elements of a selfish ecclesiasticism."

(To be continued.)

## THE BEGINNING OF A NATION.\*

BY EDWARD EGGLESTON.

### ENGLISH NOTIONS OF AMERICA AT THE \* TIME OF SETTLEMENT.

THE age of Elizabeth and James was a new point of beginning in the history of the people who speak English. The revival of learning, the invention of printing, and the reformation of religion, had awakened the men of that time to unprecedented intellectual activity, while the discovery of America by Columbus, and the dazzling adventures of the Spaniards in Mexico and Peru, had profoundly stimulated their imaginations. At this period of renaissance, English literature found the glory of a magnificent spring-time in Shakspeare and the group about him; the principles of modern scientific investigation were first formulated in the writings of Lord Chancellor Bacon, while men of action were everywhere set upon deeds of adventure and discovery. The world had regained the vigor and spontaneity of its youth. Much, also, of youthful credulity and curiosity it had at the same time, delighting in marvelous stories the more in proportion to their incredibility. Books of travel suited the prevailing taste; the great black-letter folios of Hakluyt's *Voyages* and "Purchas His Pilgrims," were favorite literature with those who could afford to buy them, and the popular taste was gratified by little fly-leaf publications and pamphlets, describing remarkable voyages and remote countries, with the strange peoples and animals inhabiting them. After the austerities and other-world speculations of the middle age, the jocund earth had been newly discovered by its inhabitants, and men were as full of knightly fervor in efforts to redeem the remote parts of the world from the oblivion of human ignorance as they had been before to recover Jerusalem from the infidel.

America was discovered in the first instance because it lay between Europe and India by the westward route, and Columbus, seeking the less, found the greater by stumbling upon it in the dark. Most of the succeeding explorers of the American coast regarded the continent chiefly as an obstruction. Purchas suggests that it might rather be called Cabotia than America, since Cabot, the famous pilot, under the patronage of Henry VII. of England, visited North America in 1497, before Columbus or Amerigo Vespucci saw the main-land of South America. But Cabot meant to find no other land but China, and thence to turn toward India, and he sailed along the American coast, not exulting in that he was first finder of a great and fertile continent, the future home of nations, but "ever with the intent to find said passage to India."

For a century the notion of a passage to the Pacific by means of some undiscovered strait severing the continent of America possessed the minds of navigators and geographers, and promoted discovery; though the hope of finding such a passage, and of coming thus into a new and rich commerce, blinded the adventurers to the real value of America, and retarded colonization. In the reign of Queen Elizabeth this South Sea theory had become a superstition, probably from the belief that in 1524, Verrazano, in sailing down the eastern coast of America, in the employ of Francis II. had seen in latitude 40° a narrow isthmus about five miles wide, with the ocean beyond it. This isthmus was incorporated into some of the maps of the sixteenth century, and Verrazano's sea, as a part of the Pacific, is shown upon charts published long after the discoveries on both coasts of America had rendered it impossible. Sir Humphrey Gilbert, who spent and lost his life in the exploration of the American

\* This paper is one of several intended to form together "A History of Life in the Thirteen Colonies." These papers will appear in this magazine, though not of necessity in consecutive numbers, since each will be upon a different topic and of independent interest. It is not advisable to cumber a magazine page with multitudinous references to authorities. I regret that the exigency of the present form prevents me from giving credit in all the cases in which I happen to be indebted to living writers, and particularly where my obligation is to the industrious special student. For the most part, however, I have drawn direct from books, tracts, letters, documents, and records the writers of which were contemporaneous, or nearly so, with the events narrated, and I have not intentionally neglected any authority within my reach in the endeavor to make the work accurate as to fact and truthful in generalization. It is not possible that I have wholly escaped error, and I will be grateful to any one who will point out, in public print or by private communication, any slip in matter of fact or detail.—E. E.

coast, wrote a treatise to prove "that there is a passage on the north side of America to go to Cataia, China, and to the East Indies," and this he demonstrated elaborately, first, by authority; secondly, by reason; thirdly, by experience of sundry men's travels; and fourthly, by circumstance. But, though the argument was so exhaustive, devout Sir Humphrey sailed in vain through the cold Newfoundland seas to find a way to China, as others did about the same time,—Sir Martin Frobisher, for instance, who was so possessed with this one thought that he believed the discovery of the north-west passage to be "the only thing of the world that was yet left undone, by which a notable mind might be made famous and fortunate."

The failure—often disastrous—of the many explorers of the sixteenth century to find a quick passage through America to China, did not lessen the hopes of the English. No matter how difficult the voyage to China by the north-west, "it will become as plausible as any other journey if our passenger may return with plenty of silver, silkes and pearle," jauntily writes Richard Willes in 1577. But the most remarkable setting forth of the general faith of learned cosmographers on the subject is found in the "Discourse on Western Planting," written in 1584, by that great advocate of American colonization, the Reverend Richard Hakluyt, apparently for the express purpose of persuading the miserly Queen Elizabeth to aid in sending forth colonies. He tells his readers that a man of St. Malo had, that very year, according to report, discovered the sea "on the backside of Hochelaga,"—the island on which Montreal now stands,—and quotes the report which Jacques Cartier heard from the Indians at Montreal, of a river navigable three months to the southward, by which we clearly recognize the Mississippi. But Hakluyt thinks that this report confirms not a little the existence of the South Sea in that vicinity. Not only is the Mississippi transmuted into a tributary of the Pacific in this argument, but the great Laurentian lakes suffer a sea-change as well, for the Indians, he says, had told Cartier of a sea of fresh water beyond Montreal, "the head and end of which was never man found that had searched." Hakluyt also has recourse to old maps, and thus reveals to us the geographical ignorance of his time. The King of Portugal had shown him "a great olde round carde," that had the north-west strait plainly set down in latitude 57°. He had also seen "a mightie large old map in parchment," traced all along the coast with Italian names, which map showed in latitude 40° a little neck of land "much like the streyte neck or isthmus of Darienna." On an old globe in the Queen's

privy gallery at Westminster, he had seen the same isthmus, "with the sea joynninge hard on both sides, as it doth on Panama," and adds: "which were a matter of singular importance, if it should be true, as is not unlikely." In another paper, Hakluyt mentions, under his breath, the proximity of the South Sea to Florida, and says that it is not good that the report be made too common!

Nor did the South Sea delusion vanish when the period of colonization was reached. Ralph Lane, the governor of Raleigh's first plantation on the Island of Roanoke, having probably inquired of the savages for some trace of that sea which Hakluyt had seen so plainly laid down "on the mightie olde mappe in parchment," was told by the inventive savages that the Roanoke River sprang from a rock so near to a westward sea, that the waves in time of storm often dashed into this fountain, making the river brackish for some distance below. They mentioned at the same time that there was gold there, and that the walls of a town in that land were made of pearls. Nothing dispirited by the extravagance of these tales, Lane and some of his men, like boys seeking the pot of gold at the foot of the rainbow, set out to immortalize and enrich themselves by ascending the Roanoke to find the Pacific Ocean, the Indians meantime plotting the destruction of the colonists left behind. Lane and his followers pursued their quest until they were obliged to eat their dogs, and then returned fasting, just in time to rescue the colony from destruction. But Lane went back to England believing that the Roanoke rose near to the Bay of Mexico "that openeth out into the South Sea," and the map of the country which the colony brought back shows a strait leading into the Pacific from Port Royal.

The Jamestown colonists were gravely instructed to explore that branch of any river that lay toward the north-west—perhaps because the charmed latitude of 40° might be reached in this way. The colonists were especially to ascend any river running out of a lake, in hope of finding another river having its head in the same lake and "running the contrary way toward the East India Sea." Even John Smith could not but hope that his second exploration of the Chesapeake might lead him into the Pacific. This notion of a passage into the South Sea in latitude 40°, just north of the limit of his own explorations, Captain Smith communicated to his friend Henry Hudson, who was so moved by the information that he sailed to America in direct violation of his orders, and it was in seeking the passage to the Pacific that he penetrated the solitudes of the beautiful river that bears

his name, and perished the next year in the great northern war which is a second memorial to his courage.

In a time of such ignorance of geography on the part of learned men, when America was not so well known as the antarctic continent is to-day, popular notions of the lands to be colonized were yet more strange. New England was long believed to be an island and the same notion prevailed regarding Virginia. Ten years after Jamestown was settled we find Captain Smith assuring his readers that "Virginia is no Ile (as many doe imagine), but part of the continent adjoining to Florida." Official ignorance was probably the last to yield, for almost a century after the beginning at Jamestown, and when almost the whole eastern margin of America had been planted with prosperous English colonies, an order of the Privy Council appointed Dudley Digges a member of the council of the "island of Virginia."

As the mistake made by Columbus, through the common misapprehension in his time of the size of the earth, had left behind an almost ineradicable passion for a way to Japan and China through the American continent, so the vast treasures of gold and silver, which the avaricious Spaniards had drawn from Mexico and Peru, produced a belief in the English mind that a colony planted anywhere in America would find gold. Here, too, the geographer Hakluyt, and many others were ready with ingenious and learned deductions from very slender premises. If an Indian had been seen wearing a head-piece of copper which "bowed easily," this flexibility proved it to be tarnished gold. If a savage told a voyager that the copper of a certain country was too soft for use, was somewhat yellow, or was of a good luster, it was enough to demonstrate that the country was rich in the precious mineral. The geographer Purchas even expounds the divine purpose in thus endowing a heathen land with gold,—that the Indian race might, "as a rich bride, but withered and deformed, \* \* \* find many suitors for love of her portion," and thus the pagans be converted. Again and again ships were laden with shining earth or worthless stones, believed to contain gold even by the clumsy goldsmiths who were sent with the explorers as assayers or experts. The seekers after South Sea passages brought home ship-loads of glittering earth from arctic islands,—"fool's gold," as the mineral is now called. Captain Newport well-nigh ruined the Jamestown plantation by consuming its supplies while he took a lading of the "dust-mica," so abundant in the Virginia sands. One of the earliest of the documents relating to the planting of colo-

nies, in the English State Paper Office, is the fragment of a report about America, made in 1580, the extravagance of which puts burlesque out of countenance. The American women are spoken of as "wearing great plates of gold covering their whole bodies like armour." "In every cottage" pearls were to be found, "and in some houses a peck. About the bar of St. Maries"—perhaps the Chesapeake, so called at that time—are to be seen fire-dragons, "which make the air very red as they fly." In these we recognize the fire-fly, while the buffalo is no doubt intended by an animal "as big as two of our oxen." But these faint resemblances to truth vanish quickly when we learn that the streets in this region are broader than the London streets, that there are banqueting-houses built of crystal, with pillars of massive silver and some of gold. "Pieces of clean gold as big as a man's fist are found in the heads of some of the rivers; there are also iron and silk-worms in abundance, and one mountain, thirty leagues farther northward, is very rich in mines."

The proposed conversion of the natives to Christianity was often a cloak to more selfish enterprises, but religious zeal was also an active motive at the time of the first planting of North America. Europeans regarded the Indians sometimes as sun-worshippers, but more commonly as worshippers of Satan himself, who, through the conjuring of the pow-wow, gave them knowledge of distant and future events, and frequently appeared to them visibly, either as a calf, or in some other beastly form.

The early explorers, from the time of Cabot, had a habit of kidnapping Indians without scruple, and transporting them to England, where the sight of such barbarians served to quicken greatly the interest in American adventures and colonization, and particularly to awaken a philanthropic desire to civilize and Christianize a people who were so benighted as not to wear trousers. The Indian man and woman taken over by Frobenius excited great attention, and pictures of them were made for the queen and others. When Weymouth, on his return from the coast of Maine, in 1605, brought into Plymouth five kidnapped Indians, with "all their bows and arrows," and with two beautiful birch canoes, Sir Ferdinando Gorges took them into his own custody, and joyfully declared that "this accident had been the means of putting life into all our plantations." In our age of great commercial activity and extended geographical knowledge one can form but a weak conception of the excitement caused by Weymouth's reports, and

especially by the appearance of these outlandish creatures of another world. Other savages were brought, and some of these were exhibited for money. One of them was, perhaps, shown after he had died, if we may guess the fact from Shakspeare's contemptuous sneer at the idle curiosity and far-away philanthropy of the crowd, in Trinculo's assertion that, in England, "any strange beast there makes a man: when they will not give a doit to relieve a lame beggar, they will lay out ten to see a dead Indian." Out of this interest in savages, no doubt, the fertile invention of the poet evoked the monster Caliban. One Indian thus brought away to England from Cape Cod, by a curious fate, "went a soldier to the wars of Bohemia"; another, from Martha's Vineyard, invented a gold mine, and, on going back to show the way to it, jumped off the ship and escaped.

The animals of America excited equally the wonder of the people in England, and no stories were so easily credited as extravagant ones. It was reported that the progress of Cabot's ships had been retarded by the multitude of codfish he had encountered off the American coast, and that the Newfoundland bears caught these fish "with their claws," and drew them to shore to eat them. King James's favor was won by a present of two living young alligators and a wild boar, and he was childishly eager to possess some of the flying-squirrels that had been introduced into English parks from Virginia. The flying-squirrel, the opossum, and the humming-bird were long considered the great wonders of America, and there was no end to the marvelous stories about them. It is hard to recognize the opossum, in one of the earliest descriptions, of "a monstrous deformed beast, whose forepart resembled a fox, the hinder part an ape, excepting the feet, which were like a man's; beneath her belly she hath a receptacle like a purse, wherein she bestows her young until they can shift for themselves." The humming-bird, on the highest authority, is declared to be a cross between a fly and a bird; the Dutch on the North River called it simply "the West India bee." They were prepared for exportation to Europe, in the New Netherlands by drying, and in Barbadoes by stuffing with fine sand and perfumery. They were considered in Europe "pretty delicacies for the ladies, who wore them at their breasts and girdles." The dogs of the Indians were said to be snouted like foxes, and were supposed to be quite unable to bark, though they could howl. The muskrat was expected to furnish musk, and the mathematician Hariot believed that the civet-cat would become a source of profit

to planters in America, but his description of the animal points to the skunk, whose perfume has never yet come into request. Some of the earliest authors speak of the raccoon as an ape. But the wild hogs of America were the strangest of all, for they "have their navels upon the ridge of their backs," says Purchas. So great was the number of new creatures revealed by the discovery of America, that European scholars were worried to get them all into the limits of Noah's ark.

The glimpses we have given here of the state of knowledge about America existing in England at the period of colonization, not only give an insight into some of the motives that prompted the planting of English communities in the New World, but also enable us to form a notion of some traits of English character at the time, and throw a light forward upon the early history of the American colonists. Out of an England stirred by the new-born intellectual life of modern times, and producing great poets, philosophers, statesmen, and adventurers, but still clinging tenaciously to the childish romances and superstitions of the middle ages, came the beginners of the new nation, such as the pleasure-seeking planters of Virginia, the rigorists of New England, and the philanthropic enthusiasts of Pennsylvania. Under every guise of sect and opinion there was present the wonder-loving, credulous, and aggressive Englishman of that age of seething religious and intellectual reaction. The mutually repellant Churchmen, Puritans, Papists, and Quakers, who spread themselves into separate communities along the wilderness coast of North America in the seventeenth century, had really more in common than they had of difference.

## II.

### RALEGH AND THE ROANOKE COLONIES.

IF one might believe the doubtful anecdote in which Walter Raleigh wins the favor of the queen by spreading his cloak to enable her to cross dry-shod the mud of the Strand, he might be said in that act to have made a bridge for English colonists to traverse the Atlantic; for, without the help of Raleigh's bold imagination, adventurous spirit, and statesmanlike foresight, there would hardly have been an English settlement in North America. In that time the difficulty of planting colonies was greater than we can well conceive. The elements of success were not yet understood; there was no recorded experience for a guide; gentlemen, soldiers, ecclesiastics,

and gold-seekers, were sent out in most of the early European colonies, instead of farmers and laborers. Then, too, England was not yet the great commercial nation and dominant maritime power she has since become, but was a small and backward state, whose resources were undeveloped, and whose little ships were ill-adapted to make the perilous voyage across the Atlantic; moreover, all her sea-ventures must run the gauntlet of danger from the hostility of Spain, whose powerful armaments bullied English commerce and preyed upon English shipping. The people of that time, overcrowded as they were, did not understand the true benefits of colonization, and Englishmen were loth to move from home, except when they had a prospect of immediate wealth from mines or conquests. The lucky fortunes amassed by the piratical warfare carried on against Spanish commerce turned men's heads, and Raleigh's schemes were more than once overthrown by the avidity of his agents to engage in the plundering of Spanish ships. John Smith, in allusion to the difficulty he had in inducing men to undertake agricultural settlements in New England, says that his task would have been easy had his design been to persuade them to a gold mine or new invention, to reach the South Sea, to despoil a monastery, capture rich caracks, or rob some poor fishermen. People who engage in privateering, he adds, "do not seek the common good, but the common goods." Unluckily, the habit of seeking the common goods had demoralized many of the bravest spirits in England.

The character of the queen was an almost insuperable obstacle to American enterprises. Her policy was admirably adapted to check and wear out her enemies in Europe, by delays, intrigues, threats, promises, deceptions, and a steady avoidance of all ambitious projects beyond the bounds of England. But this politic evasion of risks and ventures, and the invincible stinginess of Elizabeth, were main hinderances to success in colonization. She was willing enough that her adventurous and patriotic subjects should consume their estates in plantations beyond the seas; she was lavish in cheap encouragement; she even sent to Sir Humphrey Gilbert "an anchor guided by a lady," whatever that may have been, when he sailed on his fatal voyage; but Gilbert died in the vain hope that the Queen might be induced to contribute a paltry ten thousand pounds toward founding a colony, an enterprise which "required a prince's purse to have thoroughly carried out." She graciously accepted the adroit flattery of Raleigh in naming the American coast Virginia for her as a "virgin queen," but the godmother of

Virginia "contributed nothing to its education," as was wittily said at the time.

When a young man, Raleigh served in the French civil wars, on the side of the Huguenots, as one of a body of gentlemen volunteers, led by a kinsman of his own. He had opportunity, at that time, to hear of the charms of Florida from those who had escaped destruction in the ill-fated Huguenot colony at Fort Caroline. He brought to London with him, and maintained at his own expense, Le Moyne, the artist, who had fled out of that fort into the wilderness the night of the Spanish massacre, and whose curious sketches of the tattooed Florida Indians are now to be seen in the Grenville Collection in the British Museum, some of these we shall reproduce in future papers of this series. It was, perhaps, by the accounts that he had heard from the Huguenots that Raleigh was led to seek a location for his own colonies far to the south of the region explored by Frobisher and Gilbert, and certainly the change from Newfoundland to the coast of North Carolina and Virginia was a long step toward success.

In 1585, explorations having been made in the preceding year, Sir Walter sent out his first plantation under Ralph Lane. This colony deserved success far more than the ill-contrived expedition to Jamestown. It was in every way well-appointed, and contained many men of sagacity and courage. Raleigh instituted a healthy private interest from the start, in granting five hundred acres of land, at the least, to every man in the colony "only for the adventure of his person." Notwithstanding the unfortunate location on the Island of Roanoke, the wild-goose chase after the South Sea, and the imprudent attack made on the Indians, the colony had actually taken root, having, in despair of supplies from England, sowed corn on the island. In two weeks more the people would have eaten of an abundant American harvest, had not that valiant sea-rover, discoverer, and free-booter, Sir Francis Drake, on his way back from a prosperous sacking of Spanish towns in the West Indies, bethought him to visit his countrymen, the English colony in Virginia, in obedience to orders given him by the queen. Upon Drake's coming, and after the misadventure of a storm, which drove some of his vessels to sea, among which was one that he had allotted to the colony, the whole company were seized with a panic, or a frenzy of homesickness. They prevailed upon Drake to carry them to England again, and thus missed of seeing the ship sent by Raleigh, which arrived fifteen days later with supplies. Thus ended the first attempted settlement, in which were engaged such men as Thomas

SEA. (DRAWN IN 1685 BY JOHN WHITE, ARTIST TO RALEGH COLONY, NOW FIRST PUBLISHED BY PERMISSION OF THE BRITISH MUSEUM.)

Hariot, the distinguished mathematician, Thomas Cavendish, afterward renowned as a circumnavigator of the globe, and John White, a clever artist. Hariot wrote an account of the country and its products, on his return.

AN INDIAN CONJURER. (FROM JOHN WHITE'S ORIGINAL DRAWING, NOW IN THE BRITISH MUSEUM.)

In this he describes at length the virtues of a plant which the Indians called *uppowoc*, but which took in Europe the Spanish name tobacco. He expatiates particularly on the esteem in which it was held by the natives, tells how it was sprinkled in their fish-weirs for good luck, and how it was considered an offering worthy of the acceptance of their gods in times of danger or thanksgiving;—"they think their gods marvellously delighted therewith," he says. He describes the manner in which the Indians were accustomed to take "the fume or smoke thereof, by sucking it through pipes made of clay into their stomach and head, from whence it purgeth superfluous steam and other gross humors, and openeth all the pores and passages of the body"\*\*\* whereby their bodies are notably

preserved in health." The colonists, he says, "learned to suck it after their manner," and they kept up this habit upon their return to England, "having found many virtues in it." Not only many men, but also "women of great calling," and learned physicians, had adopted it at the time of his writing.

John White, the artist of the expedition, who became governor of the second colony, made some admirable drawings of the Indians, which give us the first graphic representations of American savages made from life, and the only true pictures of the Indians of the coast between Pennsylvania and Florida. Some of these were reproduced on copper, with only moderate accuracy, in De Bry's famous *Voyages*, published in 1590, and have been thence copied into innumerable later works. In 1865, the very striking original drawings were discovered and they are now safely housed in the Grenville Collection of the British Museum, through the courtesy of whose officers we are able to reproduce a portion of them from photographs, as illustrations to the present series of papers.

Sir Richard Grenville, who arrived later than the supply-ship, was disappointed to find the colony deserted by those who had been transported thither with so much expense and trouble. He left fifteen men, with provisions for two years, to hold the country. But when Grenville came back the next year with more than a hundred settlers, these fifteen, having been attacked by a superior force of Indians, who killed one of them and burned their supplies, had fled away by boat, to meet a fate unknown.

The new colony also ended in darkness. Raleigh perceived that an island without a harbor, on a coast so stormy as that near Cape Hatteras, was not a suitable place, had ordered them to establish the "city of Raleigh in Virginia," at Chesapeake,\* but these orders were disobeyed, the seamen being very hungry for Spanish booty, and unwilling to carry them farther than Roanoke Island. Here was born, soon after their landing, Virginia Dare, the first English native of America. The governor, John White, on the entreaty of the colonists, went back to England for supplies, where he found the whole nation in a panic and uproar on account of the threatened Spanish invasion, so that his ships, with all others of force, were detained in har-

\* The map drawn by White, which we reproduce on another page from the original, shows that Chesapeake, or *Chesepieuc*, was an Indian village just inside Cape Henry.

bor by the queen's order; and when at last two small barks were allowed to depart, they ran after prizes and came back stripped by French war-ships which they had encountered. At this point Raleigh found his means impaired. He had spent forty thousand pounds in American experiments, and vast sums in colonizing estates which the queen had granted him in Ireland. He therefore transferred his patent to a company of "merchants and adventurers," who undertook to care for and carry on the Roanoke colony, while he gave himself with his usual energy and daring to the defence of England against Spain. When the famous armada entered the Channel he hung upon its rear, harassing the cumbrous Spanish great galleons in an agile English man-of-war whose alert movements were compared to "a morrice dance upon the sea."

The ships of John White departed a year later, and for awhile, as a matter of course, gave themselves to profitable privateering, after which, being eager to seek yet other rich prizes in the West Indies, and having lost a boat-load of men in landing on the stormy coast, they made but a feeble search for the colonists, of whom no very definite trace was ever found, though vague rumors reached Jamestown, many years later, of a few living captives among the savages, and even these were said to have been murdered by Powhatan more than twenty years after their landing. As late as 1602, Raleigh sent an expedition at his own charge, to search for the unfortunates, if, perchance, any of them might yet be alive; but, with that infidelity so common in all expeditions of that mercenary time, the leaders of this one, neglecting the search, put forth their energies in buying sassafras, which valueless root was then so highly esteemed as a medicine, that it brought three shillings a pound in England. It was the prospective profit of a cargo of sassafras that defeated Gosnold's New England colony in the same year.

Raleigh was haughty, fond of magnificent display, and consequently unpopular. He was a favorite of the queen, doubtless, in a sense not at all honorable to that passionate daughter of Henry VIII.; but, by whatever

means he attained or held his power, he exercised it as a large-minded and patriotic statesman. Like many other pioneers in great undertakings, he gained only defeat and disgrace. But it was he who first broke ground in American colonization: his immense energy

and perseverance opened the door to the dark continent of America, and showed that a colony was desirable and practicable. Yet he reaped nothing from all his sowing but the fatal animosity of a king suspicious of all transcendent merit.

### III.

#### JOHN SMITH AND JAMESTOWN.

IN December, 1606, there lay at Blackwall, below London, three vessels: the *Susan Constant*, of one hundred tons: the *God-speed*,

*One of their Religious men*

PORTRAIT FROM LIFE, OF A MEDICINE-MAN ON THE COAST OF NORTH CAROLINA. (FROM A DRAWING IN THE BRITISH MUSEUM BY JOHN WHITE.)

of forty, and the little pinnace *Discovery*, of but twenty tons. These three puny ships were to carry the germ of a new English nation across the Atlantic. There was much excitement in London, and public prayers were offered for the success of the expedition. We may imagine that Richard Hakluyt, who had waited long for the fulfillment of his hopes, was among those most interested. Raleigh, in confinement for years in a gloomy cell of the Tower, from which he was only allowed to go out for a promenade in the twilight of the corridor, may have intermitted for a time his labors on the "History of the World," when he heard of this new beginning of the enterprise to which he had given his best endeavors in vain for so many years. And it is probable that nobody in all the English metropolis was more busy and excited over these preparations than the fussy and pedantic king, who had done his best to mar the enterprise which he believed himself to be furthering. On the 19th of that stormy December, the vessels weighed anchor

and ran out on an ebb tide, no doubt,—as one can nowadays see the ships go swiftly down the Thames, past Blackwall to the sea. But, once in the channel, their troubles began, and for three weeks they lay off the Downs, tossed by contrary winds, and tormented with their own discords. It was six weeks before they lost sight of the coast of England.

The misfortunes of the colony were foreordained; that it finally succeeded seems miraculous, for those who shaped its destinies left nothing undone that inventive stupidity could suggest to assure its failure. In particular had the frivolous monarch set himself to make laws or orders which carefully guarded the supremacy of the sovereign and the dominance of the Church, but which were quite inadequate to the protection of life and liberty in the colony. The private interest of the colonist, the most available of all motives to industry, was sunk in that of the company: all trade and profit were to be put into a common stock for five years, and the emigrants, men without families, were thrown into a semi-monastic community, like a Hanseatic trading agency with its better traits omitted; and thus, indolence and the natural proneness to dissension of men in hard circumstances were much increased. The people sent over were utterly unfit. In the first hundred there were four carpenters, one blacksmith, one tailor, one barber, one bricklayer, one mason, one drummer, and four boys.

Fifty-five ranked as gentlemen, and but twelve as laborers. "Those we write as laborers," says one of the colonists, "were for the most part footmen." "Poor gentlemen, tradesmen, serving-men, libertines, and such like, ten times more fit to spoil a commonwealth than either to begin one, or but help to maintain one," is the description given by a member of the colony. In the second supply the proportion was much the same, except that this time six tailors came, besides a jeweller, two "refiners" of metal, a goldsmith, a perfumer, and a tobacco-pipe maker. There were sent, at some time, lapidaries, stonecutters, embroiderers, and silkmen, "with all their appurtenances except materials," as Captain Smith sarcastically says. "A hundred good laborers," he cries out, "were better than a thousand such gallants as they sent me." For the most part they appear to have been unthrifty young men, or broken-down older men, incorrigibly idle and discontented. "Much they blamed me," says Smith, "for not converting the savages, when

CORRIDOR IN THE TOWER, SHOWING DOOR OF RALEGH'S CELL AT THE LEFT.

those they sent us were little better, if not worse."

If this company, so unfit for any good purpose, had had a sagacious governor at the outset from England, there would still have been hope of accomplishing something by strict discipline and strong leadership. But the king, with the ingenious folly of a petty tyrant, bent on retaining a sort of power in his own hands as long as possible, sealed up the names of the councilors in a box, not to be opened until after the arrival in America. Thus was the disorderly crew left without a head during the long voyage. For, with adverse winds and the circuitous route taken to reach America by the Canaries and West Indies, whereby they doubled the distance, and with their foolish loitering at divers places to "refresh themselves" and quarrel, they did not reach the coast until the month of April, when, by the good luck of their bad reckoning and a fortunate storm, they missed the fatal Roanoke Island, their original destination, and were carried into Hampton Roads, and so sailed up the wide mouth of the river, which they named the James, as in duty bound. At this season of the year the banks were magnificently covered, then as now, no doubt, by an endless profusion of the large white flowers of the dogwood, alternated with vast masses of the rich, pink-purple blossoms of the redbud, set against a dark background of pines and other trees, so that the sea-weary voyagers thought that "heaven and earth never agreed better to frame a place for man's habitation."

On the first landing of a small party, they were attacked by five Indians creeping in the grass like bears, who fled in dismay at the discharge of muskets. At their second landing they came upon a deserted fire, roasting in the ashes of which they found and ate for the first time the luscious oyster of the Chesapeake region, which they pronounced "large and delicate." At another place they were kindly received by the chief of the Rapahannas, who came piping on a reed flute, at the head of his train. His face was fantastically painted and besprinkled with what, to the greedy eyes of the English, seemed to be silver ore, and they surmised that his copper ornaments might be gold.

After seventeen days of voyaging in the river, they selected, in spite of the opposing judgment of Captain Gosnold, the first projector of the colony, a low-lying peninsula, upon which they founded their new city, calling it Jamestown. This unfortunate location brought them malarial disease; the neglect of the London company and the long loitering of the sea-

men had left the newly landed colonists, at the outset of their enterprise, on the very verge of famine. Seed-time had passed, while they were "refreshing themselves" in the West Indies and exploring the river; there was now no opportunity of planting until the following year. "There never were Englishmen left in any country in such misery as we were, in this new-discovered Virginia," says George Percy, brother to the Earl of Northumberland, and one of the most brave and trustworthy of the men at Jamestown. A pint of worm-eaten barley or wheat was the allowance of each man for a day. "Had we been as free from all other sins as [from] gluttony and drunkenness, we might have been canonized for saints," says Smith. "Our drink was water, our lodgings castles in the air."

To increase their misery, they lived in mortal terror of an attack from the Indians. During Captain Newport's stay in the country, he had taken a strong force and gone to explore the James River as far as the present site

of Richmond, in hope of finding the Pacific Ocean thereabout. The colonists left behind, with thoughtful imprudence deposited their awkward matchlock guns in dry vats for security, and were surprised by Indians, who wounded seventeen men and killed one boy. The savages were driven off by a cross-bar shot from a ship lying in the river, which cut down a bough of one of the trees over their heads and gave them a wholesome fright. But, now the ships were gone, the fear of the Indians made it necessary for each man to watch every third night, "lying on the cold, bare ground," and then to remain on guard the day following. This, with the small allowance of bad food and the necessity for drinking of the river-water, which was brackish at flood and slimy and filthy at low tide, brought on swellings, dysenteries, and burning fevers. Sometimes there were not five able-bodied men to defend the place in case of attack, and the sufferers were night and day groaning pitifully from famine

and sickness in every corner of the fort. "If there were any conscience in men it would make their hearts bleed," says Percy, "to hear the pitiful murmurings and outcries of our sick men, without relief, every night and day, for the space of about six weeks." Some times as many as three or four died in a single night; in the morning their bodies were "trailed out of their cabins like dogs, to be buried," and sometimes the living miserable wretches were scarcely able to bury the dead. The "tents were rotten and the cabins worse than nought." Some of the famished men and boys fled in despair to the Indians, who, not wishing to incur the displeasure of men of powers so supernatural as the English seemed, treated them well and sent them back again. Those who survived the first famine lived on sturgeon and crabs caught in the river. But one-half of the hundred colonists died, and, among the rest, Captain Bartholomew Gosnold, the first navigator who had the courage to cross the Atlantic by sailing directly west without seeking the trade-winds of the tropics, and the founder of the first, ineffectual New England colony on Elizabeth Island, in 1602, as well as the earliest advocate of the enterprise in which he lost his life. When the sturgeon had left the river, and the worm-eaten grain was spent, the Indians began to bring in supplies of corn, game, persimmons, and other food, to exchange for the trinkets of the settlers.

Adversity and peril bring the hero to the front. As the period of hunger and death drew to a close, and the reviving colonists set to work to build better shelter

JOHN SMITH. (FROM THE ENGRAVING ON SMITH'S MAP OF VIRGINIA.)

than their rotten tents and earth-covered cabins, the speculating president, Wingfield, who had appropriated stores to his own use, was deposed, and Captain Ratcliffe, a man no better, took his place. But the actual leadership passed by natural gravitation into the hands of the strongest man, who fills so large a space in the history of Jamestown for the next two years that it seems to become an epic. The hero of the story was John Smith, whom the council, on landing and opening King James's mysterious ark, had solemnly expelled from their body, of which he had been named a member in the king's orders. During the five months' voyage, the emigrants had naturally fixed their eyes on Captain Smith, a young man, twenty-eight years of age, who had been, next to Gosnold, the earliest promoter of the present colony, and the fame of whose adventures in foreign travel and exploits in battle with the Turks had already brought him into notoriety.

Engaged while yet a mere lad in the wars in the Low Countries, he was afterward shipwrecked, and again, according to his own account, was robbed at sea; he became a wanderer in France, and was near to perishing; he was thrown overboard by Catholic pilgrims, who believed the heretic passenger to be the Jonah that caused the storm, but he escaped to the shore; he was in a sea-fight between a French ship and a rich Venetian argosy; and at length he distinguished himself in the war against the Turks under the Duc de Mercœur. Here he displayed skill in engineering, and fought and killed three Turks successively in single combat, receiving from Sigismund II., of

Transylvania, a patent of nobility, with a coat of arms bearing three Turks' heads in a shield. In a later battle he was wounded and made prisoner by the Turks, who sold him with others into slavery. Smith prided himself as highly upon winning the favor of ladies as he did on his skill in taking Turks' heads, and he tells how his young Mohammedan mistress, Charatza Tragabigzanda, who could speak some Italian, fell in love with her slave. Her relatives persecuted him, and Smith, degraded and abused, with a collar of iron about his neck, at length, in a fit of desperation, slew Tragabigzanda's brother, the Pasha of Nalbritz, with a flail, concealed his body in the straw, clothed himself in the pasha's garments, filled a knapsack with grain, mounted the dead pasha's horse, and made off into the uninhabited plain. After sixteen days of wandering he reached the Russian frontier, where his iron collar was removed, and where another kind lady, the good Calamata, took an interest in his welfare and liberally supplied his wants. Covered with honors on his return into Transylvania, he was now eager to get back into his "own native land." After some adventures in Morocco, and a sea-fight by the way, he returned at length to England, like a veritable hero of romance. This last of the knights-errant, on his arrival in his own country, enlisted of course in the most difficult and

THOMAS, LORD DE LA WARE. (FROM A COPY MADE AT THE BOURNE, CAMBRIDGESHIRE, FROM THE ORIGINAL, FOR THE STATE OF VIRGINIA, NOW IN THE STATE LIBRARY, RICHMOND.)

dangerous enterprise he could find, which happened to be the colonizing of America, to which object his best endeavors were devoted for the rest of his life.

The fame of Smith, his manifest ability and winning address, as well as his military and sea-faring experience, made him a natural rallying-point for the allegiance of the colony, the names of whose lawful governors were sealed up in the well-filled box of Pandora. His popularity excited the jealousy of the other ambitious spirits of the expedition, and, as he was a high-spirited man, yet young, and at no time remarkable for modesty, it is probable that he did not conciliate his rivals by soft speeches or reticent manners. He seems to have been put under a sort of arrest during the voyage, and there was talk of hanging him on a charge of conspiring to make himself a king. When Newport with the ships was about to return, it was proposed to send him back to England to be mildly reprimanded, rather than subject his life to peril by trying him in the colony, the real object being to get rid of so influential and so clever a man with as little trouble as possible. With characteristic courage and tact, Smith demanded a trial, proved his innocence and exposed the conspiracy by the mouths of the witnesses who had been suborned against him; so that Wingfield, the president, was sentenced to pay him two hundred pounds damages, which Smith generously turned into the common store of the colony. The effect of this was to compel Captain Smith's admission to the council.

At the close of the period of suffering, he carried forward the building of Jamestown, and all had thatched houses to dwell in before he made provision for himself. Having suppressed a mutiny, he now set out on the first of his trading and exploring expeditions, buying corn, or getting it by craft or force, at all hazards. But after awhile the council complained that he had not yet gone up the Chickahominy River, which came from the north-west, and at the head of which might be found—according to the directions taken from the box—the Pacific Ocean. It was in the expedition set on foot in consequence of these complaints that Smith, while exploring with an Indian guide the “slashes” toward the head of that river, was set upon and captured by the Pamunkey Indians, who had just before surprised and slain three of his men. Never did his dexterous management of slender resources stand him in better stead than in escaping the dangers of this captivity, as, for example, by showing a pocket-compass, and, if one may credit the story, attempting to expound the mysteries of the universe

GEORGE PERCY. (FROM A PORTRAIT IN THE VIRGINIA HISTORICAL SOCIETY'S ROOMS, RICHMOND, VA.)

to the curious savages, who, perhaps, estimating his wisdom by his incomprehensibility, took him to be a man of supernatural gifts. They afterward subjected him to some mysterious pow-wow to discover his intentions. When he had been led from village to village, according to the Indian custom, he was brought before Powhatan, a chief whose prowess had awed the neighboring tribes into a sort of subjection to his leadership. Smith secured the favor of the chieftain and the affection of his little daughter, Pocahontas, who became the friend and frequent benefactor of Smith and the colonists. In the later narratives of his captivity, Smith says that she rescued him by laying her head on his when the warriors were about to beat out his brains. As the story does not occur in the earlier accounts, it has been doubted by some investigators and defended by others. It seems probable that Captain Smith gives an exaggerated account of a real interference on his behalf by this young girl.

Smith so managed the Indians, that they released him and sent him back to the fort. Every four or five days, for some time thereafter, the chief's daughter came with provisions; presents for Smith and articles for barter were brought in, for which the captain exchanged trinkets at such prices as he pleased. Smith's rivals became jealous even of his influence with the Indians, and spoiled the trade from which they lived, by paying more liberally than he for what was bought. Then arrived a second time Cap-

tain Newport, who was as helpless on dry land as a sea-turtle.

The marplot council in London sent over by Newport a crown, a bedstead, a robe, and an ewer for the unwashed chief, who kindly gave in exchange only his cast-off garments and moccasins, while he played so sharp a trick in trade that Newport secured only eight bushels of corn in exchange for all he had brought. But Captain Smith dangled before the eyes of the childish savage some blue beads, at first refusing to sell them, saying they were made of a substance like the sky, and were intended only for the greatest kings and chiefs to wear. By this ruse he secured enough corn to load his vessels for two pounds of glass beads, which were always kept sacred to chiefs and their families. Thus, with unflinching tact, now by bravado, now by cajolery, and again by judicious severity, did Smith keep the colony alive from the trade or the tribute of the savages, whose arrows were almost harmless against the armor of the English. When

an Indian tried to take his sword, Smith imprisoned and then forgave him. Finding his trade with the Indians destroyed by the non-intercourse order of Powhatan, he was compelled to get food by force, and, in a last extremity of want, he chose the boldest course, and essayed to capture Powhatan himself; but the wily chief, by corrupting the foreigners sent over to make glass and potash, discovered the plot and avoided it. Powhatan's brother, Opechancanough, having stationed about a wigwam, in which he was parleying with Smith and his handful of men, hundreds of warriors whose arrows were "nocked" ready to shoot, Smith seized the chief by the hair, put a pistol to his breast, and dragged him out before them all, and so made peace at the muzzle of a loaded firearm. When, later, Opechancanough sent him poisoned meat, which sickened, but did not kill the white men, the captain contented himself with kicking and beating the Indian who brought the poison. Smith was adroit in avoiding blood-

shed while spreading the terror of his name among the tribes about him. He was like a stout champion in the days of the Hebrew anarchy: a great fear of him fell on all the heathen round about.

Next to the preservation of the Jamestown colony, the most permanent benefit conferred on the world by Captain Smith's exertions was the exploration of Chesapeake Bay and its tributary rivers, which he made in two voyages in an open boat,—sailing, if one might trust his own estimate, three thousand miles. He sent to the company in London a map of this region marvelously correct, if we consider his facilities and circumstances,—a map that was the starting-point for all charts and surveys of this coast. In these two voyages of exploration, the little company endured many hardships, sleeping in the boat, eating damaged food, stripping off their very shirts to renew their sails after a storm, and suffering such thirst that, eager as they were to find gold, they would have refused "two barricoes of gold for one of puddle-water." In winter trips it was their habit to remove the fire two or three times in a night, to get warm ground to lie on. They were sometimes forced to fight with ten times their number of savages. It is a curious picture we get, in the compiled writings of Smith and his companions, of their life along the coast, in the rivers, and among the savages, exercising themselves in psalm-singing, praying, fighting, trading, maneuvering, lying, or evangelizing, as occasion required, like good Englishmen of the seventeenth century. Whenever Smith could win the Indians to friendliness by kind treatment, he did so. Often, by a mere display of force, he avoided bloodshed; but, when betrayed or attacked, he fought with so much address as not to lose a single man in battle, and to leave a profound respect for the English in every tribe with which he came into contact. His unflinching vigilance prevented surprise; he exacted that every company of Indians trading with the English should deposit their arms, or exchange hostages with him. He was full of expedients: knew how to hang hats on sticks to increase the apparent number of his men, and knew how to deceive the savages by politic devices or point-blank lies of great ingenuity and unblushing boldness. He showed the highest generalship in the conduct of a petty force of twelve or fourteen men; he evinced rare diplomatic tact in bringing the most hostile tribes to parley and trade; he won the affection and allegiance of his men, whose comfort he always preferred to his own; and in the broils at Jamestown, the gentlemen and soldiers who had explored

or campaigned with him after corn were his loving friends and staunch partisans.

A historian of Virginia aptly applies to Smith the words of Dean Swift: "When a great genius appears in the world, the dunces are all in confederacy against him." Three times he crushed plots, on the part of members of the council and others, to flee to England with the pinnacle, and thus abandon the colony to perish. When he came back from his seven weeks' captivity the conspirators fully intended to hang him for the death of two of the three men slain by the Indians in that expedition,—twisting some provision of the Levitical law to accomplish this murder. Newport's arrival the day before the execution was all that saved him. His hand was heavy when discipline required it; but when he found his enemies subject to his power, he treated them with magnanimity. He dealt hard blows in battle, fighting lustily and with a soldierly relish; he knew how indispensable is sternness in managing savages; but he always avoided putting to death the Indians whom he had occasion to punish; he left no blood account to be settled with neighbors, though he sometimes made the savages believe for awhile that he had executed an offender. When at last Smith had "beaten the path" for a successful settlement, had awed the Indians and made friends with them, had set the colonists to planting, and fortified and built up Jamestown, digging a well of good water, had seized for his hungry colonists the supplies brought in an illicit trading-ship by the rascally Captain Argall, had established a new settlement and sent some of the colonists to live with the Indians, there came from London the "third supply." The company, having secured a new charter and new subscriptions, now sent out five hundred men and women, of whom some were worthy people, others of the same class of scrapethrift gentlemen and bankrupts of which Virginia had already too many, with "decayed tapsters, and ostlers trade-fallen, the cankers of a calm world and long peace." The officers under the new commission, jealous of one another, had all sailed in the same ship with their three commissions, lest one should get advantage by a first arrival, and had all together gone ashore, in a hurricane, on the Bermudas. The unruly crew that got safely to Jamestown had with them, as ship-captains, Smith's old enemies, the corrupt Ratcliffe and Archer, the very couple who had essayed to hang him under the Levitical law, because the Indians had killed his men. Having neither head nor authority, these hundreds were landed like an avalanche upon the little, poverty-stricken, but now experienced and weather-hardened colony. All the old disor-

ders were set a-going again by the resolution of the newly arrived not to submit to Captain Smith's authority. With much labor he essayed to bring to subjection this mob, refusing to resign his presidency until the commissions should arrive, until, at length, he was injured by the accidental explosion of a bag of powder. As he was now no longer able to awe the mutinous by his presence, the other party gained the ascendancy; an attempt was even made to assassinate him in his bed. He probably saw the danger and uselessness of remaining longer to wrangle with the newcomers, for, under color of seeking surgical aid, he consented to go to England, and the ship was detained until charges of various misdemeanors could be made out and sent with him.

The best evidence of the importance of Captain Smith's services at Jamestown is the melancholy fact that the four hundred and ninety who were in the colony at his leaving were reduced in eight months to sixty "miserable, poor wretches," by Indian war and by desertion, but chiefly by sheer famine. When the strong hand was withdrawn, the colony quickly fell to ruin.

In his aggressive temper, ceaseless conflicts and sturdy achievements, Captain Smith reminds one of the Greek heroes; but in magnanimity and rude justice he was more modern than they. In answer to all assaults upon his fame, it is sufficient to say that his character and services commanded the homage of Percy, Strachey, and all the best and most judicious in the colony; and even his enemy, Wingfield, reluctantly paid a tribute to his diligence. He had the ardent friendship of many of the best men in England. He was a good hater, it must be confessed, though not implacable. Like most ambitious men, he had a sensitive vanity; like many travelers of his time, he shows an unpleasant tendency to exaggeration and self-laudation in his writings. His private life was pure and honorable, free from "dice debts and oaths," as one testifies; his official life was ambitious, but with a certain lofty, public spirit, and an entire freedom from the faintest blot of covetousness. He is the first of the heroes of our national history. Though it was said by a contemporary that he "loved actions better than words," yet his words are often pregnant with a keen wit, and there is a vast fund of practical wisdom in his terse and sententious writings. His views on public affairs have the breadth and good sense of statesmanship. He foresaw the importance of the coming colonial trade, and especially of the fisheries, in "breeding mariners," and thus promoting the greatness of England;

and he urged that the colonies should not annoy those who come to trade "with pilotage and such like dues." Low customs, he says, enrich a people. He was a remarkable man who could so clearly understand great economical principles in an age when almost everybody else misconceived them. In mental and physical hardihood and shiftiness, as well perhaps as in his proneness to overstatement of fact, he was in some sense a typical American,—the forerunner of the daring and ready-witted men who have subdued a savage continent, of which subjugation John Smith, of Jamestown, was the true beginner.

## IV.

## EARLY LIFE AT JAMESTOWN.

WITH the first company that came to Jamestown was a clergyman, Robert Hunt, to whom, if to any man, might be applied the words, "a light shining in a dark place." He had been a vicar in Kent, and during all the weeks that the storm-tossed and discontented emigrants lay in their little vessels in the English Channel, off the Downs, he was almost in sight of his home, and so sick that recovery seemed impossible; but he uttered no word about returning. As soon as he was able, he devoted himself to soothing the discords of the leaders and heartening the discontented. It was he who, after their landing, persuaded Captain Smith and the hostile councilors to make peace, solemnly administering the communion to them the next day, in pledge of mutual forbearance and forgiveness. In all the famine and suffering that came upon the badly provided colony immediately after their landing, he was with them; and when the wretched habitations of Jamestown were burned up, in the middle of the first winter, he lost all his books, whose companionship must have been his solace in such a wilderness and among such men. "Yet none ever heard him complain." He was as ready to bear arms in defense as any, and cheerfully shared the dangers and hardships of the colonists until he died, at some time during the first two years.

The first church of the colonists was an old sail hung upon neighboring trees to keep off the sun; for walls there were wooden rails, the pews were unhewn logs, the pulpit a bar of wood nailed to two neighboring trees. "In foul weather," says Captain Smith, "we shifted into an old, rotten tent, for we had few better, and this came by way of adventure for a new one." After awhile they built a church, "a homely little

thing, like a barn," the roof of it set upon crotches covered with rafters, sedge, and earth. Their houses were made after the fashion of the church, but were worse,—too poorly built to keep out either wind or rain.

The rotten tent, "that came by way of adventure for a new one," is a reminder that the poor little colony was continually swindled by the merchants and tradesmen who were subscribers to the company,—“such juggling there was betwixt them, that all the trash they could get in London was sent to Virginia.” The treasurer, Sir Thomas Smith, was suspected of peculation, the mariners who brought supplies plundered the stores, the men in power at Jamestown often appropriated the best to themselves, so that the colony was a skeleton that had been picked by more than one flock of vultures. Besides these, there were renegades—foreigners sent over to make potash and glass, and some of the lower sort among the English—who had run away to Powhatan, flying from the deadly misery of Jamestown; and, tempted by the liberal bribes which the chief offered, of wigwams, food, and women, these men, by the aid of accomplices in the fort, succeeded in stealing a great many swords and other arms from Jamestown; while the Dutchmen whom Smith sent to build a house for Powhatan, the capacious Dutch chimney of which is still standing, betrayed to him the weakness and plans of the colonists.

When Smith went home,—or was sent home, whichever it was,—Sir Thomas Gates and Sir George Somers having been wrecked on the Bermudas, the government fell into the hands of Percy, a good man in feeble health and deficient in will; with West (who was brother to Lord De la Warre), Ratcliffe, and Martin in the council. West ran away with the best ship to England. Ratcliffe went in one of the vessels, with thirty men, to trade in Powhatan's country, where, from lack of vigilance, he was killed with his whole party.

And now set in “the starving time,” as it was always afterward called. There was nothing to eat but roots, herbs, acorns, walnuts, and berries, with sometimes a little fish. As the distress increased, all the animals brought for breeding were eaten,—even the skins of the horses were consumed. Those who had starch ate that. An Indian, who had been killed in an attack on the fort, was dug up and eaten by the poorer sort, and some ate even their own dead. The perishing settlers bartered away arms to the savages, who soon grew boldly hostile, so that the English could not move abroad without being shot down. The shiftless and despairing people burned for fire-wood the

houses of the dead and the palisades that defended the town, sparing only the block-house for refuge, so that Jamestown looked like the ruins of “some ancient fortification.”

Of nearly five hundred colonists in October, but sixty famine-smitten wretches were found in Jamestown in the following June, and of these not one could have survived ten days longer, had not succor arrived. In three years of suffering and death since the first planting, the colony had gained only a foot-hold with much valuable experience. Unfitted for their environment, the earlier immigrants perished by that pitiless law which works ever to abolish from the earth the improvident, the idle, and the vicious. But, indeed, it would have wrought evil beyond remedy, to have planted a new land with so vile a seed.

Help came to the little remnant from an unexpected quarter. Gates and Somers, cast on the Bermudas, built for themselves two cedar vessels, rigging them with what they had taken from their wrecked ship, and thus reached Jamestown, only to find the gaunt skeleton of a colony, clamoring in the bitterest despair to be taken away from the site of so many misfortunes and horrible miseries. With such formality as the Englishmen of that time never omitted, even when they were perishing, the new chaplain, Mr. Buck, made a zealous and sorrowful prayer in the little church. Percy delivered up his authority to Sir Thomas Gates, who found himself installed a governor of death, famine, and desperation. There was not food for three weeks, the Indians were bitterly hostile, the badgered and homesick colonists had neglected to plant, and there was nothing for it but to be off as soon as possible in the forlorn hope of finding some English vessels fishing on the coast of Newfoundland. The settlers hated even the sight of Jamestown, and they would have burned its shabby remains to the ground, had not Sir Thomas Gates himself stood guard over the place, embarking last of all.

But, before the colonists, carrying the destiny of the English race in America in their retreating boats, could get out of the mouth of the river, they were encountered by Lord De la Warre—or Delaware, as it is written now—sailing in with a new batch of immigrants, abundant supplies for a year, and a commission as governor. He turned Gates' party about, and landed with them at Jamestown. Again they all repaired to the little church, where there was a new formality,—first a sermon, and then the reading of his lordship's commission, and an address from the new governor. Under De la Warre's gov-

ernment the state and ceremony were very amusing, and the witty Captain Smith, who sought his ends in a direct way, without flummery, does not fail to laugh at the many well-paid dignitaries in so slender a colony,—“as many great and stately officers and offices as doth belong to a great kingdom.” Such strutting of lieutenant-generals and admirals over a hamlet of log-cabins in a wilderness is ludicrous, and one can hardly help suspecting that the king had a hand in these pompous devices. There were also privileges for cities, charters, corporations, universities, free schools, glebe-land,—“putting all these in practice before there were either people, students, or scholars, to build or use them, or provision or victual for them that were there.”

Lord De la Warre took immediate precaution against future want. Gates was dispatched to England for supplies, whence he returned with one hundred cattle and other provisions; the aged but indomitable Somers, in his own cedar vessel, set sail for the Bermudas to seek provision, and died there. Argall traded successfully in the Potomac, where an English lad, who had been saved from death by Pocahontas, acted as interpreter; and Percy was sent to chastise the neighboring Paspeheghs. These fled at his approach, so that he captured only the chief's wife and children, who were afterward put to death in cold blood, to punish the husband and father,—an act of barbarous inhumanity that could not have occurred under the ruler, but juster government of Smith, “who never shed one drop of Indian blood by way of punishment,” says Stith.

But if De la Warre sometimes forgot justice and mercy in dealing with the savages, he nevertheless paid much attention to religion. He almost rebuilt the little church, so that it was sixty feet long, with chancel and pews of fragrant cedar, and a wooden font, hewed out like a canoe. The governor had the church kept constantly adorned with the lovely wild flowers of Virginia, which were renewed every day. His lordship must have impressed the imaginations of his few subjects, as, on Sundays, he walked to the little church, attended by the councilors, officers, and gentlemen, and guarded by fifty men with halberds, wearing his lordship's livery of showy red cloaks. His seat in church was a chair covered with green velvet; a red velvet kneeling-cushion was before him to enable him to worship the Maker in a manner becoming the dignity of a great lord over a howling wilderness. More than one-fourth of all the able-bodied men in Jamestown were required to get the governor to church, and back again to his cabin, with propriety.

But Lord De la Warre's dignity seems to have served a good purpose in stilling the voice of faction, and during his brief rule there was quiet. He appointed certain hours for labor, which were light enough for men beset with enemies and in danger of famine. From six to ten in the forenoon, and from two to four in the afternoon, were spent in work. At the close of the morning's task all assembled in the church for prayer, and again, at four in the afternoon, prayers were read. The remainder of the day was spent in recreation. The one hundred and fifty men whom his lordship had brought over were mostly laborers, and he wrote to the company, on his arrival, that “a hundred or two debauched hands, dropt forth by year after year, ill-provided for before they come, and worse governed when they are here,” were not fit to be “carpenters and workers in this so glorious a building.” Jamestown in De la Warre's time was surrounded with a palisade of posts and plank, having a gate at every bulwark, and a main gate toward the water; at every gate was a demi-culverin—a long gun carrying a nine-pound shot. The cabins were roofed with bark, after the manner of wigwams; they had large fire-places, which in that boundless forest were kept well filled in winter time. All that could be done in the way of elegance was to hang about the interiors the Indian mats, brightly colored with the blood-red juice of the puccoon root.

The settlers early learned to like the native food. Strachey, who was secretary to the colony under De la Warre, boasts of seeing oysters in Virginia thirteen inches long, and adds: “The wild turkey, I may well say, is an excellent fowl.” The colonists ate the land-turtle daily, and had learned to eat the green snake, as the savages did. The raccoon or “arrachoune” was esteemed an excellent meat. They cooked the maize after the Indian methods, in ash-cakes, mush, and pones, and the sugary persimmon in their “baked and sodden puddings.” The colony sent out shoots in the way of new plantations, when the number of immigrants increased. All the earlier settlements were inclosed with pales—made probably of plank and logs—except on sides where they were protected by the river. The malarial Jamestown was destined never to become the center of trade and influence its projectors intended it to be. In 1614 it had three rows of framed houses; to-day it has long been a ruin.

The coming of Sir Thomas Dale to the governorship, after the brief rule of De la Warre, marks the beginning of the permanent establishment of the plantation. For, though he was a harsh governor and put in force a

martial law, yet his practical wisdom and energy, and even his harshness, brought about an order and a prosperous expansion, that the scoundrelism of Argall, his successor, could not overthrow. When Dale arrived on the 10th of May, 1611, the colonists, with their usual improvidence, had planted no seed, trusting to the three months' store of corn, and to such luck as might happen when that should be exhausted. At Jamestown he found most of the company "at their daily and usual work, bowling in the streets." But the firm hand had come at last, and, late in the season as it was, he set all to planting and building defenses.

The five years of common stock prescribed by the king's order had now expired, and Dale took advantage of it to bring in private interest, though at first in a niggardly way. The old colonists were allowed three acres, on which they might work one month in the year for their own support; the other eleven months they must serve the company, from whose common store they received only two barrels of corn. But the new immigrants in Dale's own settlement at Bermuda Hundred were allowed to reverse this arrangement, giving the common store one month, and spending eleven on their own land, from which they paid a tribute of two barrels and a half of corn yearly to the store. Even this introduction of individual interest, restricted and mean as it was, drove away the fear of famine from the colony.

But the danger of want came presently from an unlooked-for prosperity. In the year after Sir Thomas Dale's arrival, John Rolfe planted some tobacco, thinking Virginia might compete with the Spanish colonies in the growing of a commodity which had at this time come into demand in Europe. The foolish law-makers and councilors, imagining that they could with advantage bind trade by artificial restrictions, fixed the price of corn, as an article of necessity, at two shillings sixpence the quarter, about a fourth of the cost of grain brought from England. Tobacco having been found far more profitable than corn at so low a price, the latter was neglected, and the prosperous tobacco-growing colony was obliged to depend on the Indians for food. As is always the case where such an arbitrary interference with the law of demand and supply is attempted, a new one had to be devised to remedy the evil of this; so that it was enacted, in Sir Thomas Dale's time, that every farmer should plant a certain amount of land to corn, or suffer the confiscation of all his tobacco. But, when Argall arrived in 1617, he found Jamestown falling to ruins, the very streets planted with tobacco,

and the dispersed people engaged in the culture of the profitable plant. Thus early was shown the tendency of tobacco-planting to check the growth of cities and villages.

The same Rolfe who, of the English settlers, ventured first to plant tobacco, was also the first Englishman to take an Indian wife in legal wedlock. Whether Pocahontas really took Captain Smith's head in her arms, and begged his life when he was about to be slain, or whether she intervened in his behalf in some less dramatic way, or not at all, it is certain that a friendly relation grew up between Smith and this extraordinary Indian child, during his stay with Powhatan, for soon afterward, the great chief, wishing to persuade Smith to release certain Indians whom he had detained for some offenses, sent Pocahontas, with others, to secure their liberation, which Smith granted, affecting that it was only the great love he bore to Pocahontas that induced him to let them go. And, indeed, he seems sincerely to have admired her, for he says, in his earliest account, that "not only for feature, countenance, and proportion," she "much exceeded any of the rest of Powhatan's people; but, for wit and spirit," she is "the only nonpareil of his country."

From her first meeting with Smith she became devotedly attached to the English, and rendered the settlers many services. She often secured supplies for them, and indeed seems to have haunted the fort, utterly naked as she was, after the manner of little girls among her people, who wore no clothes and showed no modesty until they were twelve or thirteen years of age, at which time they put on a deerskin apron, and were very careful not to be seen without it. The agile little barbarian would persuade the English lads to make wheels of themselves by turning upon their hands and feet, whereupon she would follow them, wheeling as they did, all through the fort.

Her real name was Matoax; but, by order of Powhatan, this was carefully concealed from the whites, lest by their supernatural enchantments they should work her some harm. When Richard Wyffin was sent from Jamestown to apprise the endangered Captain Smith, environed by foes among Powhatan's people, of the death of his deputy, Mr. Scrivener, and his ten companions by drowning, Pocahontas hid him, misdirected those who sought him, and, by extraordinary bribes and maneuvers, brought him safely to Smith, after three days' travel in the midst of extreme peril. So, also, when Ratcliffe was cut off with thirty men, she saved the lad Spilman, who was then living with Powhatan, and sent him to the Potomacs. But the most touching story

of all precedes in order of time the other two. In the same difficult adventure among Powhatan's people, in which Captain Smith was engaged when Scrivener was drowned, the treacherous chief had arranged to surprise Smith at supper, and cut off the whole party, when Pocahontas, the "dearest jewel and daughter" of the aged chief, "in that dark night came through the irksome woods" to warn the captain of Powhatan's design. Captain Smith offered to repay her kindness with such trinkets as the heart of an Indian maiden delights in; "but, with the tears running down her cheeks, she said she durst not be seen to have any, for, if Powhatan should know it, she were but dead; and so she ran away by herself as she came."

In 1613 Pocahontas was among the Potomac Indians. Captain Argall, a man of much shrewdness and executive force, but infamous for his dishonest practices, happened to be trading in the river at that time. He quickly saw the advantage the English would gain in negotiations with Powhatan for the return of the white prisoners held by him, if he could secure so valuable a hostage as the chief's daughter. With a copper kettle he bribed Japazaws, the chief with whom she was staying, to entice her on board the vessel, where he detained her, much to the sorrow of the daughter of the wilderness, whose life hitherto had been as free as that of the wild creatures of the woods. To Jamestown, where she had frolicked as a child, and whither she had so often come as a friend with food, she was now carried as an enemy and a prisoner. She had refused to enter the town since the departure of Captain Smith.

This transaction, not very creditable to the gratitude of the English, accomplished its purpose in causing Powhatan to return the white men held in slavery by him, with the least useful of the stolen arms. But he still contrived to evade some of the demands of the English, who therefore retained his daughter until the affair took a new turn. John Rolfe, who seems to have been a widower, became enamored of Pocahontas, now growing to womanhood, and wrote a formal letter to Sir Thomas Dale, proposing to convert her to Christianity and marry her, which pleased the governor, as tending to promote peace with the Indians, and was likewise acceptable to Powhatan. The chief sent an old uncle of Pocahontas and two of her brothers to witness the marriage.

This marriage brought about peace during the life of Powhatan, who, on one occasion at least, sent a present of buckskins to his daughter and her husband. A free intermingling of the two races took place, and Englishmen

were accustomed to hire Indians to live in their houses and hunt for them. This amity lasted eight years.

In 1616, more than two years after their marriage, Rolfe and Pocahontas went to England with Sir Thomas Dale. Powhatan sent some Indians with his daughter, one of whom was commissioned to count the number of the English. The arrival of the Lady Rebecca, as Pocahontas was called after her baptism, produced a great sensation. She was received by the king and many distinguished people, went to see a play, and, by help of her naturally quick wit, bore herself very well. But it became necessary to desist from calling her the wife of John Rolfe, for the king was very jealous, and it was seriously debated in the privy council whether, by marrying the daughter of a foreign potentate without the king's consent, Rolfe had not committed treason.

The climate of London, and perhaps also the uncongenial habits of civilization, affected Pocahontas very unfavorably, and she was taken to Brentford, where Smith, then busy with his preparations to sail for New England, visited her. In the successful efforts of Rolfe and others to win her to the Christian faith and to marriage, they had not scrupled to deceive her, by telling her that Captain Smith was dead, probably because they knew she would not marry another white man while she believed that great warrior alive. When, therefore, she saw the "brave" who had been the object of her maidenly admiration, she turned her face away and refused to speak for the space of two or three hours. When she did, it was to claim the privilege of calling him father, which Smith granted only after importunity, afraid, perhaps, of incurring the king's displeasure. Pocahontas went to Gravesend to take ship for her return to America, much against her will, for she had become weaned from her savage life and greatly attached to the English. At Gravesend she died of small-pox three years after her marriage, leaving one son, from whom some of the most prominent Virginia families trace their descent.

The peace ensuing upon the marriage of Pocahontas, with the prosperity that followed the establishment of individual interest in land and the raising of so profitable a commodity as tobacco, did not do more to promote the welfare and stability of the colony than the sending out of young women for wives to the colonists, which began in 1619, during which year ninety were sent over. Again, in 1621, one widow and eleven maids, carefully selected, were sent out to be married, it having been remembered, at a late day, "that the plantation can never flourish till

families be planted, and the respect of wives and children fix the people in the soil." The price charged in 1621 for each of this dozen, to be paid by the men whom they should freely accept, was one hundred and twenty pounds of the best leaf tobacco. If any of them died, the price of the remainder was to be raised, so as to protect the company from loss. For the next invoice of thirty-eight "maids and young women," the price demanded of settlers seeking wives was a hundred and fifty pounds of tobacco. According to the cruel and arbitrary spirit of the times, some, at least, of these maids were "pressed,"—that is, torn from their homes by force, and a great

terror spread through parts of England, and many young girls concealed themselves. But this cruel violence, like the rape of the Sabine women in the Roman story, provided wives for the beginners of a great empire. When once there were house-mothers in the cabins of the colonists, and English children born in the country, the settlers no longer dreamed of returning to England. The new land became a home, Virginia was securely planted, and other settlements were probable. But the significance to the world of this little plantation on the margin of an unexplored continent could not be understood even by the most hopeful men of that time.

---

### THE LADY, OR THE TIGER?

In the very olden time there lived a semi-barbaric king, whose ideas, though somewhat polished and sharpened by the progressiveness of distant Latin neighbors, were still large, florid, and untrammelled, as became the half of him which was barbaric. He was a man of exuberant fancy, and, withal, of an authority so irresistible that, at his will, he turned his varied fancies into facts. He was greatly given to self-communing, and, when he and himself agreed upon anything, the thing was done. When every member of his domestic and political systems moved smoothly in its appointed course, his nature was bland and genial; but, whenever there was a little hitch, and some of his orbs got out of their orbits, he was blander and more genial still, for nothing pleased him so much as to make the crooked straight and crush down uneven places.

Among the borrowed notions by which his barbarism had become semified was that of the public arena, in which, by exhibitions of manly and beastly valor, the minds of his subjects were refined and cultured.

But even here the exuberant and barbaric fancy asserted itself. The arena of the king was built, not to give the people an opportunity of hearing the rhapsodies of dying gladiators, nor to enable them to view the inevitable conclusion of a conflict between religious opinions and hungry jaws, but for purposes far better adapted to widen and develop the mental energies of the people. This vast amphitheater, with its encircling galleries, its mysterious vaults, and its unseen passages, was an agent of poetic justice, in which crime was punished, or virtue rewarded, by the decrees of an impartial and incorruptible chance.

When a subject was accused of a crime of sufficient importance to interest the king,

public notice was given that on an appointed day the fate of the accused person would be decided in the king's arena, a structure which well deserved its name, for, although its form and plan were borrowed from afar, its purpose emanated solely from the brain of this man, who, every barleycorn a king, knew no tradition to which he owed more allegiance than pleased his fancy, and who ingrafted on every adopted form of human thought and action the rich growth of his barbaric idealism.

When all the people had assembled in the galleries, and the king, surrounded by his court, sat high up on his throne of royal state on one side of the arena, he gave a signal, a door beneath him opened, and the accused subject stepped out into the amphitheater. Directly opposite him, on the other side of the inclosed space, were two doors, exactly alike and side by side. It was the duty and the privilege of the person on trial to walk directly to these doors and open one of them. He could open either door he pleased; he was subject to no guidance or influence but that of the aforementioned impartial and incorruptible chance. If he opened the one, there came out of it a hungry tiger, the fiercest and most cruel that could be procured, which immediately sprang upon him and tore him to pieces as a punishment for his guilt. The moment that the case of the criminal was thus decided, doleful iron bells were clanged, great wails went up from the hired mourners posted on the outer rim of the arena, and the vast audience, with bowed heads and downcast hearts, wended slowly their homeward way, mourning greatly that one so young and fair, or so old and respected, should have merited so dire a fate.

But, if the accused person opened the other

door, there came forth from it a lady, the most suitable to his years and station that his majesty could select among his fair subjects, and to this lady he was immediately married, as a reward of his innocence. It mattered not that he might already possess a wife and family, or that his affections might be engaged upon an object of his own selection; the king allowed no such subordinate arrangements to interfere with his great scheme of retribution and reward. The exercises, as in the other instance, took place immediately, and in the arena. Another door opened beneath the king, and a priest, followed by a band of choristers, and dancing maidens blowing joyous airs on golden horns and treading an epithalamic measure, advanced to where the pair stood, side by side, and the wedding was promptly and cheerily solemnized. Then the gay brass bells rang forth their merry peals, the people shouted glad hurrahs, and the innocent man, preceded by children strewing flowers on his path, led his bride to his home.

This was the king's semi-barbaric method of administering justice. Its perfect fairness is obvious. The criminal could not know out of which door would come the lady; he opened either he pleased, without having the slightest idea whether, in the next instant, he was to be devoured or married. On some occasions the tiger came out of one door, and on some out of the other. The decisions of this tribunal were not only fair, they were positively determinate: the accused person was instantly punished if he found himself guilty, and, if innocent, he was rewarded on the spot, whether he liked it or not. There was no escape from the judgments of the king's arena.

The institution was a very popular one. When the people gathered together on one of the great trial days, they never knew whether they were to witness a bloody slaughter or a hilarious wedding. This element of uncertainty lent an interest to the occasion which it could not otherwise have attained. Thus, the masses were entertained and pleased, and the thinking part of the community could bring no charge of unfairness against this plan, for did not the accused person have the whole matter in his own hands?

This semi-barbaric king had a daughter as blooming as his most florid fancies, and with a soul as fervent and imperious as his own. As is usual in such cases, she was the apple of his eye, and was loved by him above all humanity. Among his courtiers was a young man of that fineness of blood and lowness of station common to the conventional heroes of romance who love royal maidens. This royal maiden was well satisfied with her lover, for he was handsome and brave to a degree unsur-

passed in all this kingdom, and she loved him with an ardor that had enough of barbarism in it to make it exceedingly warm and strong. This love affair moved on happily for many months, until one day the king happened to discover its existence. He did not hesitate nor waver in regard to his duty in the premises. The youth was immediately cast into prison, and a day was appointed for his trial in the king's arena. This, of course, was an especially important occasion, and his majesty, as well as all the people, was greatly interested in the workings and development of this trial. Never before had such a case occurred; never before had a subject dared to love the daughter of the king. In after years such things became commonplace enough, but then they were in no slight degree novel and startling.

The tiger-cages of the kingdom were searched for the most savage and relentless beasts, from which the fiercest monster might be selected for the arena; and the ranks of maiden youth and beauty throughout the land were carefully surveyed by competent judges in order that the young man might have a fitting bride in case fate did not determine for him a different destiny. Of course, everybody knew that the deed with which the accused was charged had been done. He had loved the princess, and neither he, she, nor any one else, thought of denying the fact; but the king would not think of allowing any fact of this kind to interfere with the workings of the tribunal, in which he took such great delight and satisfaction. No matter how the affair turned out, the youth would be disposed of, and the king would take an æsthetic pleasure in watching the course of events, which would determine whether or not the young man had done wrong in allowing himself to love the princess.

The appointed day arrived. From far and near the people gathered, and thronged the great galleries of the arena, and crowds, unable to gain admittance, massed themselves against its outside walls. The king and his court were in their places, opposite the twin doors,—those fateful portals, so terrible in their similarity.

All was ready. The signal was given. A door beneath the royal party opened, and the lover of the princess walked into the arena. Tall, beautiful, fair, his appearance was greeted with a low hum of admiration and anxiety. Half the audience had not known so grand a youth had lived among them. No wonder the princess loved him! What a terrible thing for him to be there!

As the youth advanced into the arena he turned, as the custom was, to bow to the king, but he did not think at all of that royal

personage. His eyes were fixed upon the princess, who sat to the right of her father. Had it not been for the moiety of barbarism in her nature it is probable that lady would not have been there, but her intense and fervid soul would not allow her to be absent on an occasion in which she was so terribly interested. From the moment that the decree had gone forth that her lover should decide his fate in the king's arena, she had thought of nothing, night or day, but this great event and the various subjects connected with it. Possessed of more power, influence, and force of character than any one who had ever before been interested in such a case, she had done what no other person had done,—she had possessed herself of the secret of the doors. She knew in which of the two rooms, that lay behind those doors, stood the cage of the tiger, with its open front, and in which waited the lady. Through these thick doors, heavily curtained with skins on the inside, it was impossible that any noise or suggestion should come from within to the person who should approach to raise the latch of one of them. But gold, and the power of a woman's will, had brought the secret to the princess.

And not only did she know in which room stood the lady ready to emerge, all blushing and radiant, should her door be opened, but she knew who the lady was. It was one of the fairest and loveliest of the damsels of the court who had been selected as the reward of the accused youth, should he be proved innocent of the crime of aspiring to one so far above him; and the princess hated her. Often had she seen, or imagined that she had seen, this fair creature throwing glances of admiration upon the person of her lover, and sometimes she thought these glances were perceived, and even returned. Now and then she had seen them talking together; it was but for a moment or two, but much can be said in a brief space; it may have been on most unimportant topics, but how could she know that? The girl was lovely, but she had dared to raise her eyes to the loved one of the princess; and, with all the intensity of the savage blood transmitted to her through long lines of wholly barbaric ancestors, she hated the woman who blushed and trembled behind that silent door.

When her lover turned and looked at her, and his eye met hers as she sat there, paler and whiter than any one in the vast ocean of anxious faces about her, he saw, by that power of quick perception which is given to those whose souls are one, that she knew behind which door crouched the tiger, and behind which stood the lady. He had expected her to know it. He understood her nature, and his soul was assured that she would

never rest until she had made plain to herself this thing, hidden to all other lookers-on, even to the king. The only hope for the youth in which there was any element of certainty was based upon the success of the princess in discovering this mystery; and the moment he looked upon her, he saw she had succeeded, as in his soul he knew she would succeed.

Then it was that his quick and anxious glance asked the question: "Which?" It was as plain to her as if he shouted it from where he stood. There was not an instant to be lost. The question was asked in a flash; it must be answered in another.

Her right arm lay on the cushioned parapet before her. She raised her hand, and made a slight, quick movement toward the right. No one but her lover saw her. Every eye but his was fixed on the man in the arena.

He turned, and with a firm and rapid step he walked across the empty space. Every heart stopped beating, every breath was held, every eye was fixed immovably upon that man. Without the slightest hesitation, he went to the door on the right, and opened it.

Now, the point of the story is this: Did the tiger come out of that door, or did the lady?

The more we reflect upon this question, the harder it is to answer. It involves a study of the human heart which leads us through devious mazes of passion, out of which it is difficult to find our way. Think of it, fair reader, not as if the decision of the question depended upon yourself, but upon that hot-blooded, semi-barbaric princess, her soul at a white heat beneath the combined fires of despair and jealousy. She had lost him, but who should have him?

How often, in her waking hours and in her dreams, had she started in wild horror, and covered her face with her hands as she thought of her lover opening the door on the other side of which waited the cruel fangs of the tiger!

But how much oftener had she seen him at the other door! How in her grievous reveries had she gnashed her teeth, and torn her hair, when she saw his start of rapturous delight as he opened the door of the lady! How her soul had burned in agony when she had seen him rush to meet that woman, with her flushing cheek and sparkling eye of triumph; when she had seen him lead her forth, his whole frame kindled with the joy of recovered life; when she had heard the glad shouts from the multitude, and the wild ringing of the happy bells; when she had seen the priest, with his joyous followers, advance to the couple, and make them man and wife before her very eyes; and when she had seen

them walk away together upon their path of flowers, followed by the tremendous shouts of the hilarious multitude, in which her one despairing shriek was lost and drowned!

Would it not be better for him to die at once, and go to wait for her in the blessed regions of semi-barbaric futurity?

And yet, that awful tiger, those shrieks, that blood!

Her decision had been indicated in an instant, but it had been made after days and

nights of anguished deliberation. She had known she would be asked, she had decided what she would answer, and, without the slightest hesitation, she had moved her hand to the right.

The question of her decision is one not to be lightly considered, and it is not for me to presume to set myself up as the one person able to answer it. And so I leave it with all of you: Which came out of the opened door, —the lady, or the tiger?

### THE GRAVE-YARD AT SIPPICAN.

COME to this spot among the rocks and pines,—  
This hidden acre thou hadst ne'er beheld  
Unless persuaded by a poet's lines,  
Or by the circumstance of death compelled.

The summer suns pour down their fervid heat  
On stunted herbage and a sterile soil:  
The storms of winter hurl their stinging sleet,  
And the hurt trees in agony recoil.

These modest monuments no great names bear;  
Thou tread'st not, traveler, on a hero here;  
Yet these were strong to do and brave to dare,  
And filled their places on the busy sphere.

They and the sea were surely kith and kin,  
And o'er these graves, although they never stop,  
Marauding sea-fogs that come driving in,  
A tribute from their salty plunder drop.

Near this lone nook their labor was not done:  
Through calms and storms, from port to port they ran:  
Or from the tropic to the frozen zone  
They sought and slaughtered the leviathan.

Their virtues or their vices who shall tell,  
Or what their harbor since life's sails are furled!  
Remote from strife and tumult they sleep well  
"Here at the quiet limit of the world."

Such simple histories deep lessons teach,—  
Who seeketh wisdom let him pause and learn,—  
That in His plan God hath remembered each,  
And each He satisfieth in his turn:

That death, relentless, still is not unkind,  
The vexed and weary to compel to rest;  
Nor mother earth in her affection blind  
To call her crying children to her breast.

*Edward N. Pomeroy.*

## THE BABY SORCERESS.

My baby sits beneath the tall elm-trees,  
A wreath of tangled ribbons in her hands;  
She twines and twists the many-colored strands,—  
A little sorceress, weaving destinies.  
Now the pure white she grasps; now naught can please  
But strips of crimson, lurid as the brands  
From passion's fires; or yellow, like the sands  
That lend soft setting to the azure seas.  
And so with sweet, incessant toil she fills  
A summer hour, still following fancies new,  
Till through my heart a sudden terror thrills  
Lest, as she weaves, her aimless choice prove true.  
Thank God! our fates proceed not from our wills:  
The Power that spins the thread shall blend the hue.

*Thomas Wentworth Higginson.*

## SCULPTURES OF THE GREAT PERGAMON ALTAR.

"And to the angel of the church in Pergamum write: These things saith he that hath the sharp two-edged sword: I know where thou dwellest, even where Satan's throne is."

*The Revelation of John, ii: 12-13, Revised Version.*

THE recently discovered sculptures of the Pergamon Altar, the fragments of which are now being set up in the Berlin Museum, constituted, so far as we know, the last great plastic work of the Greek genius, and are to the Hellenistic Age\* what the monumental marbles of the Parthenon are to the age of Pericles. They consist of a colossal marble frieze representing the fierce conflicts of gods with giants, smaller reliefs picturing quiet mythic scenes, and imposing fragments of cornice, column, and ceiling, and, with other portions not yet found or wholly destroyed, composed the Great Altar, which was in antiquity the glory of the summit of Pergamon (or Bergama, as the Turks call it),—one of the seven cities of the Apocalypse.

The history of these important discoveries is as follows: In 1861, Carl Humann, a young German engineer, who had been ordered south for his health, came, in his wan-

derings, to the summit of Pergamon. Here he found the natives engaged in excavating marble, which they were feeding to lime-kilns and breaking up for building purposes. On closer inspection he discovered that what they were so ruthlessly destroying were fragments of a great ruin, and of its noble decorative sculptures. Indignant at such vandalism, he succeeded in stopping the destructive work of the kilns. His further investigations impressed him still more with the archæological and artistic value of the discovery, and he determined to devote himself to organizing an expedition for the purpose of excavating. Five long years elapsed before he was able again to visit Pergamon, when, to his dismay, he found that the lime-kilns had resumed their work. So energetic, however, were his measures during this visit, that the wholesale destruction of ancient sculptures was stopped by the direct influence of the Grand Vizier. Three years

\* By an inadvertence, for which the author was not responsible, the title of Mrs. Mitchell's last article (see THE CENTURY for May, 1882) was printed as "The Hellenic Age of Sculpture," when the sculpture of the "Hellenistic Age," which followed the Hellenic, was the subject treated. The significance of the word "Hellenistic," as it is now employed by historians and archæologists, is too useful to be lost sight of. The Hellenic Age, or the "Golden Age," ends properly with the conquest of the world by Alexander, after which the Greeks became cosmopolites, and foreign elements mingled with the population. The civilization resulting from these political changes showed a decline from the pure Greek or "Hellenic" model, and is called "Hellenistic."—EDITOR.

later, having contracted to build several roads in the neighborhood, he was able to make Pergamon his head-quarters, and to watch with jealous eye the attempts at destruction. One day, in wandering over the Acropolis, he came upon the glorious full figure of a god in high relief, just exhumed; returning, shortly after, to conceal this new treasure, he found, alas, that it had been ruthlessly hacked up to make a step in a flight of stairs. How much more of surpassing strength and beauty perished at the hands of ignorant natives can never be told. In 1871, Humann took from the long Byzantine fortification wall two grand fragments of relief, and presented them to the Berlin Museum. Although seized with a consuming desire, which never left him, to excavate on this summit, in the conviction that very much more was to be found, he succeeded in obtaining no assistance until 1878, the German Government, up to that time, having been too busy in subsidizing the thorough and extensive excavations at Olympia. After waiting for seven years Humann finally gained the ear of Professor Couze, the new director of the sculpture galleries at Berlin, and found a liberal patron in the Crown Prince of Germany. A nearly forgotten passage in an obscure author, Ampelius, which speaks of a great marble altar at Pergamon, forty feet in height, with colossal sculptures (*cum maximis sculpturis*), relating to the combats of gods and giants (a gigantomachie), suggested an object to the learned professor, and he advised Humann to search for this very altar, as he believed the reliefs already found to belong to those described by Ampelius. A Turkish firman was secured, workmen were engaged, and a ship of war was put at Humann's disposition; but all was done so secretly that when, at the end of two years, a multitude of cases suddenly appeared unheralded and unwelcomed in front of the Berlin Museum, the questions flew from mouth to mouth: "Where do they come from?" "What is in them?" "Who has sent them?" Once they were safe under the protecting care of the German eagle, it was announced that, in thanks for aid given the poor Mohammedan refugees from Circassia, Turkey had granted the Germans the privilege of digging at Pergamon, and that these four hundred and sixty-two boxes had cost in all but one hundred and fifty thousand marks or thirty-five thousand dollars. Humann is still at work with his skilled band of excavators, and new cases are continually arriving.

The Great Altar belongs almost incontrovertibly to the long and glorious reign of Eumenes II. (197-159 B. C.), under whom

Pergamon reached its highest level. On a lofty terrace of the city's southern slope, there long stood a simple, almost rude, structure, the ancient shrine and temple of Athene Polias. To this sacred spot the devout brought their offerings, and here they lifted up their prayers. But, when Attalus, king of Pergamon, having compelled submission from powerful foes and accumulated great wealth, had raised his city from obscurity to be the capital of a mighty kingdom, such primitive shrines no longer sufficed. A great open-air altar, imposing in size and glorious in significant decorations, was raised at the foot of the older and humbler temple, where its smoke should rise as grateful incense before this ancient shrine. This site confirms the belief, already gathered from inscriptions, that the altar was built in honor of "Athene Nikephoros," the victory-bringing daughter of Zeus (or Jupiter). Strabo informs us, in a tantalizingly short sentence, that Eumenes II. adorned his capital with magnificent structures. The recent discovery, by the French, at Delphi, of a decree, made by the Ætolians for Eumenes, has, happily, thrown further light on the great activity of this prince. From this, it appears that, after success in war and the extension and consolidation of his dominion, Eumenes II. celebrated competitive games, and made offerings to Athene Nikephoros, thus rendering more glorious the old rites, or establishing new ones. Sending three ambassadors to the Ætolians, he craved a recognition of all these pious services; and the decree, set up in sacred Delphi, and now brought to light, testifies that his request was granted. Thus, at the zenith of his power, Eumenes II. appears occupied with erecting thank-offerings for his successes. That the Great Altar itself was one of these memorials of thanks is most probable, and this idea receives confirmation from the forms of the letters inscribed on it, which are identical with those of other inscriptions discovered at Pergamon commemorative of Eumenes' wars, but very different from the letters in inscriptions of either earlier or later kings.

Eumenes' brother and successor, Attalus II., also erected thank-offerings for victory to the gods. His Stoa, decorated with all the paraphernalia of battle, in terrible and speaking confusion, is a revelation of the ability of the Greek sculptor of that time to make attractive even trophies of war. Inscriptions commemorative of public victory, side by side with others erected to the memory of private individuals, have also been discovered on Pergamon's summit, witnessing to the existence of other monuments.

This great art activity was, however, con-

fined to the time of Pergamon's kings. The glory of the Greek dominion soon paled before the rising sun of Rome. Scarcely thirty years after the Romans had aided the royal house of Attalus in extending its conquests far into the heart of Asia Minor, Pergamon passed into the possession of Rome. This was done by the testament of Attalus III. With this new rule artistic life began to wane; an occasional statue was erected in honor of a priestess of the goddess, or of some high Roman official. To Augustus a new temple was built on the very summit of the Acropolis, above the ancient shrine of Athene; and on the square in front of her temple a large monument to him was erected. After Hadrian, even the erection of honorary statues to members of the royal family seems to have ceased. Poverty soon usurped the seat of former grandeur. The Athene temple was in ruins when upon a part of its substructure was raised the last monument of peace,—a Christian church. From the ruins of still another, and a more spacious basilica, in the lower town, it would appear that the Christian community of Pergamon was large. Christians settled on the Acropolis itself, and to obtain building material for their huts tore out whole slabs from the Great Altar. The fortifications must, in time, have become too extensive for their scanty forces to defend; they broke down the altar and raised from the material a wall five to six meters thick, running across the summit, thus greatly contracting the line of defense. Although the Mohammedans, when occupying the citadel as a fortress, may occasionally have repaired the fortifications, the Christians seem mainly to have been instrumental in the destruction there carried on. No sign of a mosque, or even a Turkish grave, has been found; but the testimony of Byzantine buildings is confirmed by oral tradition that Christian families dwelt there, sustaining a precarious existence, till within a few generations. The fact that most of the heads of the gods from the frieze are gone seems to find a natural explanation in the zeal of the early Christians for establishing the new religion on the ruins of the old. Since they regarded the whole Greek Pantheon represented on the altar as remnants of a hated idolatry, it is not improbable that they mutilated their statues. A passage in the Revelation of St. John, addressed to the angel of the church at Pergamos, seems to hint at this spirit of animosity: "I know where thou dwellest, even where Satan's seat (throne) is." That this colossal open altar to the heathen gods should be called the throne of Satan is most probable, when we remember the size and form of the altar, the

presence of so many false gods in its sculptures, and, finally, the numerous serpents' coils carved upon its base.

Fortunately for us, many of the sculptures, rudely torn from their places by the Byzantine Christians, were with soft mortar built into their new structures (the principal of which was a long wall eighteen feet thick), in such a manner as to preserve many of the lines and surfaces in excellent condition. Sadder far has been the fate of much else, which could not be used directly as building material, but was thrown into the kilns, and long since reduced to shapeless lime.

Before attempting to study the varied scenes and groups of these wonderful reliefs, and in order better to gain an idea of their significance, as well as artistic merit, let us cast a glance at the structure of the Great Altar and the place these slabs occupied upon it.

On the terraced slopes of the Acropolis, at the foot of the ancient temple of Athene Polias, and looking far off over the plain and away even to the sea beyond, stood the sacred altar. Its foundation was laid on a platform built upon older structures, in which are still traces of ancient paintings. About the center of this large platform arose the main structure of the altar, as is proved by its foundations, measuring 34.60 by 37.70 meters. By a careful study of the numerous fragments and of the site, Richard Bohn has succeeded in making a most skillful restoration of the whole, reproducing for us the magnificent architectural forms of old. As the Greek temple, the dwelling of the gods was always slightly raised above that of mortals, so the structure supporting this altar proper was raised above the profane level by three steps. Around this substructure, broken only on one side by the grand stairway leading up to the altar, and lining the sides of the stairway itself, ran the great frieze on which was to be seen the battle of the gods with the giants. Above and below the frieze were powerful cornices, measuring 14.4 meters long and 2.30 meters high, and combining the fineness of architectural detail peculiar to the works of the Phidian Age with a grandeur and boldness of composition leading over into the massive forms of Roman architecture. Thus, by these strongly pronounced and regular cornices, solidity and repose were given to the surging lines of this sea of sculpture. In the upper cornice, we should see the names of the gods, in the lower those of the giants, and still below them those of the artists modestly added in very small letters, but these letters are unfortunately gone, excepting a very few fragments. One of these, however,

RESTORATION OF THE GREAT ALTAR AND OTHER BUILDINGS AT PERGAMON, BY RICHARD BOHN.

inscribed NEKPATO, is thought to throw some light upon the question. It is probably a fragmentary part of the genitive of the name Menecrates, a master mentioned by Pliny in close relationship with Apollonius and Tauriscus, two sculptors from Tralles, near Ephesus, who seem to have been the sons by adoption of Menecrates, and who executed for Rhodes that well-known group, called the Farnese Bull, now in the Naples Museum. This shattered word NEKPATO points to a connection between the art activity in these several places, and we may imagine the sculptors of Tralles wandering about, serving, now republican Rhodes, now the art-loving sovereigns of Pergamon.

Crowning the imposing substructure of the altar, was a graceful portico of Ionic columns, its inner wall surrounding the open platform in the center of which, it is supposed, was once the burning altar itself. As worshipers walked about this platform they doubtless saw, lining the wall surrounding it, those smaller reliefs 1.57 meters high, which now fill the workshop of the Berlin Museum, and read, from their elegant forms, the idyllic stories of mythic heroes. On one, in the midst of a rocky landscape, Hercules (in form and pose very like the colossal Farnese Hercules at Naples) stands under the broad-spreading branches of a palm tree and watches his child, the babe Telephus, at his feet, playing with the udder of its feline nurse. On another relief are depicted wedding scenes; on still others people engaged in unloading or in building ships; they partake of festive meals, join in processions, sit in quiet converse, or engage in conflicts of arms. These chatty sculptures are all composed without the reserve of older relief. The sculptor ren-

ders *genre* scenes of every-day life with a disregard of the limits of his medium not before met with in Greek art, but in a spirit which gains the ascendancy in the reliefs of the coming age. Although the composition is thus deficient, the story told is intensely interesting, and the single figures are beautiful.

In the ruins of the Great Altar were also found a number of statues, which perhaps once occupied the colonnade, or the platform about the place of sacrifice. Some of these doubtless represented priestesses of Athene, as is indicated by inscriptions found on the spot; others seem to represent deities. One head, a pearl of beauty, is, both in features and expression, so like the Venus of Melos as to strike the most hasty observer. The drapery on the right side of another, a semi-nude statue, also suggests the Venus by the identical arrangement of the folds. In fact the general features of some of these Pergamon statues are so like the whole treatment of the Venus of Melos that it would seem as though the riddle of her age were approaching a solution. Of these statues, four finely executed figures of stately women, as well as eight standing ones, each a treasure in itself, are all still inaccessible to the public, the disposable space in the Berlin Museum being inadequate for the complete exhibition of these new treasures. It is an interesting sight to watch the white-robed sculptor, Freres, with marble bits, stepping around among the colossal forms, trying to adjust a hand, an arm, or a stray lock in its fit place. Indeed, the tourist or student who allows himself time in the German capital, may see this frieze, under Freres's skillful hand, grow little by little toward perfect-

RESTORED VIEW OF THE TEMPLE OF ATHENE (PERGAMON).\*

tion. New motives, startling combinations not dreamed of, are so constantly revealing themselves, that much may be expected from the fragments still packed away, or laid out on shelves in the workshop. Unfortunately, far more hands and feet are preserved than figures, and the mind recurs with a terrible sense of loss to the smoking lime-kilns, and the busy barbarians pounding up glorious sculptures to feed the hungry fires.

As the figures of the giants play such an important part in the Pergamon reliefs, we are interested to know their story. To Homer they were a race of the far-off, unknown West, who, in the remote ages, by their wantonness and presumption, called down upon themselves the destroying vengeance of the gods, which proved their complete annihilation. Hesiod likewise describes them as lawless spirits, born of the Earth (Ge), who fought the Olympic gods in armor like that of the Greek heroes. It was Pindar, however, who sang more fully the deeds of this wild, earth-born race, and he was followed by many others who gave the giants semi-human, semi-dragon shapes. So vehement was the insolence and violence of this brood born of Ge,

that the dwelling of the gods itself trembled, and all the powers of Olympus were called to the defense. Zeus's lightnings, Apollo's arrows, Hephæstus's fire, and Athene's bravery, as well as the strength of the human hero Hercules, were required to overpower this heaven-daring host; and in spite of the might and cunning of their mother Ge, who sought to make harmless the terrible weapons of the gods, the latter were at last triumphant, destroying the power of evil which had threatened to overturn their beneficent rule. Doubtless, to others besides Pindar, this meant that fruitless was the opposition of any power to the divine rule of the gods, who wrought order out of chaos. In the later poetic myths, other monsters are drawn into the battle. Titans, Hecatoncheires and Typhon as well as the presumptuous pair, the Aloidæ, who piled Ossa on woody Pelion to scale the dwelling of the Eternals. Indeed, so imminent was the danger that even gentle Aphrodite and love-inspiring Eros join in the tumult.

Such a universal conception of the mythic contest must have filled the sculptor's mind as he executed the tremendous frieze around

\* Restored view of the beautiful ancient square about the temple of Athene on the Acropolis of Pergamon. (It was excavated in the summer of 1881, and the results of the discoveries are very rich.) On the left rises the temple of Athene at one end of this ancient *piazza*. Behind this temple is the Stoa of Attalus II., a most beautiful colonnade, with sculptures of trophies taken in war, forming the balustrade of the upper story. In the remote background is the temple of Augustus, a much later addition, and in the foreground the pedestals on which stood bronze statues, which we may now believe to have been originals of such great works as the "Dying Gladiator." Mr. Bohn, who made this drawing and directed the excavations, has placed the "Dying Gladiator," as will be seen, on the long pedestal by the front wall of the square. At the right is the gate which led up to the top of the Acropolis.

SELENE. FROM THE GREAT PERGAMON FRIEZE. (BERLIN.)

the altar at Pergamon. The names of fifteen gods inscribed on the cornice are preserved: Aphrodite and her mother Dione, Athene, Hercules, Amphitrite, are among them, likewise Oceanus and Triton, the gods of the sea, Ares, Themis, Leto and her sister Asteria, the mother of Hecate, and probably the name of Enyo. Among the numerous gods and goddesses preserved in these marbles, only Athene's name finds its undoubted figure, known by her warlike accouterments, ægis, helmet, and shield. But the characteristics of a few of the other gods are rendered with such clearness that they may also be recognized. That regal form about which the robes flow in lines of power is, doubtless, the mighty Zeus, symbolizing the superiority of spiritual over brute force, which is embodied in that bearded, shaggy-haired giant with bestial pointed ears and threatening gesture, who, rising up on his snaky legs, violently attacks the highest himself. With left arm raised and wrapped in a shaggy skin, the giant strives to shield himself from Zeus's thunder-bolt and death-striking ægis. One beautiful giant in the prime of youth, paralyzed by the sight of this ægis, has sunk already, powerless in his agony. Physicians see in this figure all the symptoms of convulsions and not wounds; the muscles of the right arm conglobate, the groins contract, the head falls back, and the

legs give way in writhing such as is seen in actual convulsions. Besides his terrible ægis, Zeus wields forked lightnings. One is ready to be hurled from his broken left hand, another has already pierced the quivering thigh of a youthful giant; its flames glide up over the outstretched, vainly pleading arm. This power of evil is surely doomed, and must be crushed, in spite of its attractive form. Above, to make the victory more complete, Zeus's sacred bird, the eagle, fights with the snaky part of the oldest giant. Indeed, in these reliefs the eagle is often repeated, as the emblem of the general of this battle-field. They appear five times in the fragments preserved, sometimes bringing the thunder-bolt to Zeus, or again plunging their pitiless talons into the opened jaws of their serpent foe. As of yore, these powerful birds still sweep in majestic flight over Pergamon's summit.

In the great frieze, many gods of light are easily recognized, while others still remain an enigma. That figure with youthfully slender but glorious form, having a quiver-strap across the superb chest, must be Apollo. His swift-footed sister, Artemis, we recognize in a beautiful figure with flowing drapery girt about the waist so as least to impede motion, and feet delicately shod. That triple-headed, six-armed figure, before which every one pauses, must be Hecate, and the strong charioteer with fluttering robes, cautiously but surely guiding his four fiery steeds while swinging a flaming torch at the enemy, is, doubtless, Helios, god of day. Before him, heralding his approach, is perhaps Eos, goddess of the early morning, and the broken figure that once rode in advance of this stately group is supposed to be the gentle moon goddess, Selene. (Notice, in the representation of this figure, the generous folds of her fluttering mantle, as well as the exquisite imitation of fur in the skin thrown over the beast she rides.) All there is left to remind us of giants in this gently riding figure, is the indicated motion of her right arm, and the signs of colossal wings in the background of the slab.

Strange as it may seem, the form of pleasure-loving Dionysus is also to be seen in this turmoil of battle, in a corner slab of the altar. With the ivy wreath in his long curling hair, the nebris bound above his thin *chiton* and fastened to the right arm, the god rushes forward, accompanied by his panther. A fragment of his face, showing us long, oval, dreamy eyes, and a band across the low forehead, has recently been identified among the fragments. These eyes are strikingly different from those upon another fragment,—a helmeted head, doubtless belonging to Ares,

IDEAL BRONZE HEAD. (BRITISH MUSEUM.) See page 96.

god of war,—which are almost round, and, while deeply set, seem ready to start from their sockets in their eager, intense life. Turning from the gods to their enemies the giants, we find their names, carved in smaller letters, on the cornice below the great frieze. Sixteen such names have been preserved, either wholly or in fragments, only one of which is familiar,—a noticeable fact, which hints at unknown fields in mythology.

How rich the imagination that gave these monsters form! Sometimes they are so noble and beautiful that we can scarcely believe them to be enemies of the gods, and again so bestial that we feel they merit utter annihilation. Thus we find one whose body is human, his legs serpents' coils ending in venomous heads, his neck and ears those of a buffalo, and his

colossal wings have a finny and feathery texture strangely mingled, and about his bearded face appear a finny growth, pointed ears and horns. But what a contrast to his still unbroken force is the pathos of that youthful giant behind him who has fallen vanquished to the ground. The agony of his face haunts us as the left hand feebly seeks the arrow which has pierced the manly chest, but fails to draw it out. Death, as in the face of the so-called Dying Gladiator, is already written on his youthful brow, furrowed now like that of age. In strong contrast to these fallen forms are those of the contending giants, perfect human shapes, clad in full armor, and represented in vigorous action.

So hopeless is the feeling of wild disorder received from these groups of the great frieze,

ZEUS GROUP, FROM PERGAMON. (BERLIN.)

face, although human in feature, fully in keeping with the beastly neck. Another bears on snaky coils a human body, which, in turn, carries a lion's colossal head, the arms ending in lions' claws. Among the giants we sometimes find grand, bearded faces, so similar in type to the traditional head of Zeus that we might readily believe them akin, were it not for their look of passionate suffering or rage, so foreign to the benignant faces of the King of Olympus. One of these monsters, a colossal human form, springing back from the flaming torch of his beautiful female antagonist, suggests the Beelzebub of Milton; his

especially in their present shattered state, that we may ask, Is there here any of that symmetry so characteristic of earlier Greek composition? Going back to the *Æginetans* we find there a monotonous correspondence of part to part. In the Parthenon, likewise, this balance, although most gracefully veiled, is always present. But can we bring order out of this entanglement of serpent coils, human bodies, triumphant gods with their attendant lions, dogs, winged horses, and eagles? Are not all the limitations and traditions of the sculptor's art hopelessly lost in this confusion? Even in these fragments, however, close observation

discovers in the midst of apparent disorder and contrast of detail, a harmony directing the whole. If this is true of these broken fragments how much more must it have been true in the originally perfect composition. Thus the Zeus and Athene groups, the ones on which depended the whole contrast, correspond in the number of figures, and the tremendous sweep of Zeus to the left seems to offset the swaying of Athene to the right. These two groups probably occupied the east side of the building, which faced the main approach, and, as recent discovery shows, stood beside each other. The fragments remaining from both sides of the grand stairway show how skillfully the sculptor used even that irregular space, bringing its sculpture into harmony with the rest of the frieze. Happily, parts of all the figures on the left side of the stairway, from the corner of the frieze at the bottom, to the very top, are preserved, and have been placed in their proper relation by Mr. Bohn in his drawing. To the worshiper ascending the stairs would have been visible the struggling giants, hard pressed in battle from below by the group of gods and goddesses, and, from above, by one of Zeus's powerful eagles, thus assuring him of the ultimate triumph of the heavenly powers.

How magically the spirit of beauty has been thrown over all this fierce combat! Not even the revolting, oft-repeated lines of serpents' coils break the spell. And, could we see these weird forms once more raised on the wall they adorned, there can be no question that their writhing, struggling motion, set off against the intenser upright action of the gods, would produce an infinitely more powerful impression than they now do, arranged in sundered groups in the Berlin Museum.

There is, moreover, but little here to remind us of earlier groups: this frieze abounds in new and bolder motives. Where, in the range of ancient art, has the sculptor been so prodigal or successful in representing the back? Where has he expressed such variety in falling, and displayed such fantasy in combining human and animal forms? The Pergamon sculptors seem to have had the human shape, with all its possibilities of plastic representation, as much at their command as the man of letters has his vocabulary. We find nothing, indeed, in the range of ancient art, with which to compare it, except the Parthenon marbles of well-nigh three hundred years before.

We have in these reliefs a very different class of Pergamon works from that to which belongs the Dying Galatian (the so-called Dying Gladiator), with its strongly pronounced individuality. The forms and features of these gods and giants have nothing of this portrait-like realism about them. While the

FIGURE OF GODDESS, FROM PERGAMON. (BERLIN.)

variety is infinite, they all follow several great ideal types. The same is true of the goddesses, who seem one great sisterhood. That the fundamental type of their faces,

VEILED GODDESS HURLING SNAKE-BOUND VASE AT THE ENEMY. FROM PERGAMON. (BERLIN.)

moreover, is different from that of the centuries before, but equally beautiful, will appear on studying the face of that superb nameless goddess, who hurls a vase, coiled about with a snake, at her falling enemy. Observing her beautiful face closely, we find that it is a short oval, pointed toward the chin, and quite unlike the full round ovals of the Parthenon frieze, or the long narrow faces of the gentle mourners on the tombstones of the age of Praxiteles; besides, the forehead is much lower than that of the Demeter, a type of the female figures of Praxiteles, and more pointed than the fore-

heads of the Parthenon maidens; the lips are fuller, the small, proud mouth is more open, and the coiffure is much more elaborate. The hair rolls back more boldly from the forehead, the roots showing in fine contrast to the smooth skin; in front of the ears nestle two beauty curls, likewise unknown to the works of earlier times, as a glance at existing monuments shows.

This grand type of female beauty, a delight in itself, will also throw light on that rare bronze head, purchased a few years ago by the British Museum, it is said for £10,000. This head is more than life size and still has interesting signs

on the neck of the simple way in which the ancient workers in bronze patched up defective places. Deep mystery hangs around the place of its discovery, and the story of Mr. Newton's fruitless search for the site of its provenience is an illustration of the mystification thrown in the way of archaeologists by ignorant but crafty Orientals. Comparison of this bronze head with the goddesses of the Pergamon frieze may, at least, aid in assigning to it a date. In both faces we find the same short pointed oval contour, low forehead, full but small mouth and chin, and the same arrangement and treatment of the hair.

Not only was the skill of the Pergamon sculptors shown in their treatment of the human form, but the horse represented in the Parthenon marbles is here no less powerful in his frame-work, and equally far removed from anything ordinary or prosaic. Look but at those two steeds, plunging high over a fallen giant. A piece of a shield appears above their proud necks, the charioteer, perhaps Ares, the god of war, stretching forward in the eagerness of battle. Place alongside of these a photograph of the horses of the Parthenon frieze, and, making all allowance for the difference in the height of the relief, mark the glorious similarity in conception. Finally, notice in the Pergamon fragment the subtle lines of the skin and the excited motion of the hair, more true to nature; and, although it may sound heretical, we ask, Does not this Pergamon span appeal to us moderns more than do the severer and more schematic Parthenon steeds?

While grand ideal types underlie all the work of these later sculptors, we see close observation and conscientious rendering of naturalistic detail. Above the deep undertone of ideal form, they sound a myriad of lighter, more fleeting notes, all caught from nature and blended in one harmonious whole. The hair, eyebrows, ever-changing folds of skin, and varied texture of garments or fur, are astonishingly real, giving life-likeness to these idealized forms on a scale unknown to us before in plastic art. The silken garments of one torch-bearing goddess, the thin *chiton* or thick leathery *nebris* worn by Dionysus, the wonderful surface of Zeus's mantle, whether flowing or lying in horizontal folds, show the master's skill in imitating stuffs. But these particulars are always secondary to the grandeur and beauty of the lines in which the drapery follows the forms, or answers to its motion. Hence it always remains powerful and dignified, never descending to mere display of technical skill,—the details seeming like the delicate surface play over profounder depths.

PLUNGING HORSES, FROM PERGAMON. (BERLIN.)

These slabs of the great Pergamon frieze—of coarse-grained marble—seem to have been affixed to the building before they were sculptured; and there, away from the comfortable studio, the chisel and the borer did their

work. Moreover, if they were executed like the smaller Telephus frieze from the same altar, then these masters used no convenient points for measurement, but carved direct into the obdurate marble with the freedom that a painter shows in the use of his brush. It caused no little amazement to the Italian sculptors, in cleaning the small frieze, to find that even on the parts which were left only roughly blocked out, there were no signs of the points, so indispensable to the modern workman. May not this freedom of hand have contributed to the pictorial effect of these marbles, banishing anything that might be too severely statuesque in their treatment?

This pictorial character appears not only in tremendous foreshortening,—as, for instance, in the right leg of Athene's fallen enemy,—the freedom in rendering the bodies in most varied postures, and the great depth of the relief (sometimes thirty-one centimeters), but also in the rich surface already referred to. It seems almost as though the master were working in colors with their power of expressing perspective, texture, etc., and not in hard, monotoned marble. Going back to the Parthenon, we see in its exquisite drapery and gently varied surface of skin, the beginnings of this same pictorial conception and rendering, which are thrown over the earlier, sternly statuesque forms, like a transfiguring veil.

But let us pause here, for these Pergamon reliefs of the great frieze, like those of the Parthenon, are not pictures. They do not attempt the minute and intricate composition of a painting, as seen in modern reliefs like that on the doors of the Florentine Baptistry, or that less familiar one in the Pavia Cathedral. In keeping with the character of true relief, the one surface plane is always kept emphatic, not being broken up and made unquiet by attempts at distant groups and accessories of landscape, etc., crowded into the background.

The Laocoon group of the Vatican has some features of strong resemblance to the dying giant of this Athene group. But, in the Laocoon, we see only the writhings and contortions attendant upon physical suffering, and become so distressed by the sight, that the eye, repelled, wanders away, seeking relief. In this group, however, although physical pain is expressed, yet, like the discords in music, it seems introduced only to make more powerful the harmonies in this great symphony in marble. We are fascinated by the beauty of the giant, moved by the anguish of his mother, and taken altogether captive by Athene's noble form and Nike's swift grace, as well as by the glorious thoughts expressed in the whole.

But, even while fancy and chisel were

molding at Pergamon this last great plastic creation of the Greek genius, there were premonitions of a change which should come over the ancient world.

Rome was now striding on, with giant steps, to universal empire, and its machinations were soon to prove fatal to the Pergamon dynasty. Roman power had extended the borders of these kings in order to humble Macedon. This accomplished, they no longer needed Eumenes, and decided to humiliate the very power they had built up. Scandal began to whisper reports about treacherous dealing with their faithful ally, Eumenes. The Roman senate, winking at the renewed invasions of the terrible Galatians into his kingdom, even proclaimed the independence of these wild neighbors of the Pergamon state, and refused to listen to Eumenes' remonstrances. Although this prince succeeded in leaving his kingdom unbroken to his brother, Attalus II., yet, slowly and surely, Pergamon was coming under the iron rule of Rome. With the decline of political power there came also a cessation of creative life in the art of Pergamon, and, in fact, much which had been produced was now, doubtless, transported to Italy, to grace a Roman holiday.

Roman generals were now in Greece, with their formidable legions. With their triumphs in view, they commenced the wholesale transportation of artists and works of art to their capital on the Tiber. In one short year, 189 B. C., two such great triumphs were celebrated: the one drawing on Greece, the other on Asia Minor, for its decorations. Fulvius Nobilior, after conquering the Ætolians, entered Rome in that year with two hundred and eighty-five bronze, and two hundred and thirty marble statues, taken principally from Ambracia and Cnidus; he brought with him many Greek artists, who were to make more showy the festivities connected with his triumph, by the works of their genius. In the same year Cornelius Scipio, after his victory over Antiochus, at Magnesia, near Smyrna, celebrated his triumphal entry into Rome with works, which, it is said by the ancients, first awakened in the Romans a taste for Greek art. How vast the treasure brought to Rome by Paulus Æmilius after his victory over Perseus of Macedon, at Pydna, about twenty years later (168 B. C.) appears from the statement that three whole days were required for the passage of his procession into Rome, and that one day did not suffice for the entry of his two hundred and fifty wagons, laden with statues and paintings.

These few instances, out of many others

ATHENE GROUP, FROM PERGAMON. (BERLIN.)

which might be given, are enough to show what the Roman generals did toward tearing Greek art away from the lands where it had blossomed. Governors of provinces and emperors did not fall behind their predecessors in this work. The fame of Verres is too closely linked with such work, by Cicero's attacks upon him, to need mention. Augustus, who, finding Rome a city of brick left it one of marble, required many Greek works to give his extensive architectural undertakings their proper finish. His example was followed by many others, among whom was his friend Asinius Pollio. As an additional fact of interest, it may be mentioned that, while under Augustus many archaic works, as well as those of the age of Praxiteles, were brought to Rome, almost none of the Phidian or of the later Hellenistic Age are mentioned.

The owning of these statues, as well as the prevalent fashion of visiting the Hellenistic world, and seeing the rich cities there adorned with decorated temples and palaces, aroused among the Romans an emulation of the Greeks, and the amount of art activity, thus created and stimulated, can scarcely be overestimated although this was clearly from no genuine love of art, but from a mere fondness for display. Wherever a public building arose,—and the number of these public buildings was countless,—the chisel of the sculptor was employed. Statues, singly and in groups,

adorned the niches, intercolumniations, and roofs, filled the pediments and lined the steps of the temples, theaters, amphitheaters, basilicas, baths, gate-ways for bridges, balustrades and arches of all kinds. One theater, built by Scaurus, was decorated with three thousand bronze statues and the fountains erected by Agrippa in the year 33 B. C. at Rome were adorned with three hundred bronze and marble statues besides four hundred marble columns, and public squares were filled with statues of the emperors and gods.

But private buildings employed the sculptor even more than public. Pictures and statues were regarded, as early as Sulla's time, as being as necessary a part of a rich man's furniture as his carpets and silver. Even Cicero, who boasted of having little interest in art, spent a large sum of money in buying statuary and reliefs to decorate the academy he had laid out in his Tusculum villa. When the house of a rich man burned down, we are told that his friends sought to make good his loss by giving him "marble statues and fine bronzes by celebrated masters." Often, however, they were cheated as to the master, it having been not uncommon then, as now, to increase the money value of a statue by attributing it to some celebrated master.

Greek works were, of course, used as far as they went, but they could not suffice to

meet the growing demand, which the frequent great fires in Rome, consuming countless treasure, only increased. The extensive multiplication of the same statue,—as, for instance, the so-called Faun of the Capitol, which exists in twenty-nine copies at least,—as well as the numerous duplicates of the Doryphorus, and other statues, show that celebrated originals were copied, often, doubtless, to satisfy the demands of those who could not obtain Greek originals. According to Josephus, Agrippa adorned the whole Phœnician city Berytus (modern Beirut) with statues and copies of old works. Moreover, not only the rich, but also the middle, and even poorer, classes, came in for their share in this beautifying process, using often cheaper materials. In the libraries of those for whom marble and bronze were too costly, as Juvenal tells us, plaster casts were used; representing ancient philosophers and poets.

Besides the accurate copies, there were many variations made in older works, a striking feature of the time of Roman dominion, when little or no creative power seems to have existed. So, clearly, the Venus of Medici is a variation on Praxiteles's Cnidian Aphrodite; the disk-throwers in London, Munich, and Rome, variations on Myron's Discobolus, and the statues of Athene, in the villa Ludovisi, and elsewhere, repetitions of Phidias's Athene Parthenos. Until within a few years we have been able to read only through these feeble Roman imitations, up to the thoughts and inspirations of the older masters; but with the discoveries in the ancient Greek world these Roman works sink back into their proper rank in relation to the originals of the earlier time. Who, after seeing the noble form of the Apollo of the Pergamon frieze, throbbing with life and natural in every line, can look with the admiration of old upon the cold theatrical form of the Apollo Belvedere; or who, after becoming familiar with the beautiful surface-play in the drapery of the statues found at Pergamon, can regard with unmingled pleasure the barren folds worn by the Muses found in Roman villas?

Many of the masters of the Roman time copied even archaic originals, giving them, however, a surface-rendering freer, but less attractive, than that of the genuine unaffected older works. This tendency seems to have prevailed in the school of Pasiteles, who flourished in the first century B. C. Statues with the inscriptions of his scholars exist in the villas Albani and Ludovisi at Rome.

Alongside of this imitation of older works in Rome, this grasping back into the old

store-house of form and subject, there went also a tendency to portraiture and historic relief, representing exactly the men and rulers of Rome, and the battles of their legions. So the triumphal arches and columns appear carved with the chronicle of actual march, siege, or war. The numerous sites where these portraits, statues, and busts of emperors and privates have been found, the galleries where they are collected, and the passages in ancient authors which describe them, give approximately an idea of how prolific was this age in such works. But these works lack that fineness of feeling and careful modeling seen in the portrait heads of the Hellenistic age. The realistic tendency of the former time is carried out, but with more coarseness. The most casual peculiarities of face and form even are given, the very warts in the cheek are imitated; but, too often, the fine perception and rendering of character is lost in unpleasant detail.

Looking over this vast number of monuments from the time of the Roman dominion, we are struck by their similarity wherever found. So the statues found in the widely scattered provinces of Rome, whether England, France, Spain, or those of Asia and Africa, and even Greece itself, are all alike. The subjects, treatment, and even *technique* are the same, and invariably draw from us remarks deprecatory of an art so servilely imitative in character, and so inferior in execution to the great works preserved to us from older times.

Unfortunately, nearly all the statues discovered in Italy, at some time or other, have fallen into the hands of merciless restorers. The passion of discoverers and collectors, in the sixteenth century, to piece out and polish up, to the great injury of the work of art, seems to have been as strong as it is to-day; hence much that in its original freshness might have been agreeable and of use in study is now utterly ruined for scholar or artist.

For about one hundred and fifty years after the commencement of our era this reproductive, imitative, and portrait art maintained itself, holding fast to the technique and traditions handed down to them. But with the Antonines the descent becomes rapid, until by the time of Constantine the capabilities of the ancient sculptors are at so low an ebb that we gladly bid them farewell, and, with freshened joy, we turn to admire that which has been rescued from those elder days of departed glory, and drink in inspiration and strength from the scattered rays streaming into our own lives and thoughts.

## THE LED-HORSE CLAIM.

A ROMANCE OF THE SILVER MINES.

BY MARY HALLOCK FOOTE,

Author of "Friend Barton's Concern," "A Story of the Dry Season," etc.

AT THE FOOT OF THE PASS.

### I.

#### THE NEW MINING-CAMP.

THE ark of the mining interests, which had drifted about unsteadily after the break in bonanza stocks in the summer of '77, had rested, a year or two later, in a lofty valley of Colorado, not far from that great "divide" which parts the waters of the Continent. It rested doubtfully, awaiting the olive-leaf of Eastern capital. By no stretch of metaphor could either the promoter of mining schemes or the investor in the same, be presented in the character of Noah's dove, but through

their agency the olive-leaf returned, before the snows had blocked the mountain-passes, and the gay, storm-beleaguered camp, in the words of its exhibitory press, began to "boom."

The snows of that bleak altitude give their first warning while the September sun is still strong; by November they may be said to prevail; but no disheartening combination of bad weather, worse roads, and worst accommodations at the journey's end, could deter the pioneers from bearing a city into the unfriendliest spot where such exotic growth ever flourished. Their movement had the absolute conviction, the devotedness, of a crusade. They pressed onward, across the Great South

Park, following its white wagon trails which rise and sink with the long swells of that archæan sea; pausing in the dreary valley at the foot of the pass, which shelters the caravansary-like town of Fairplay; struggling upward, in the cold light of early morning, along the mountain sides; resting again at the last stage-station above the timber-line, where the tough fir forests bend, and fail, and finally give up altogether the ascent of those bare slopes, ever whitening, to the pitiless region of lasting snow; on again into the strenuous air of the summits, following the pass as it staggers through the wild cañons; dizzily winding, by weary grades, down to the desolate land of promise.

Foremost in the strange procession were seen those wandering Ishmaelite families whose sun-darkened faces peer from the curtains of their tents on wheels along every road which projects the frontier farther into the wilderness.

The discontent and the despair of older mining-camps in their decadence hastened to mingle their bitterness in the baptismal cup of the new one. It exhibited in its earliest youth every symptom of humanity in its decline. The restless elements of the eastern cities; the disappointed, the reckless, the men with failures to wipe out, with losses to retrieve or to forget, the men of whom one knows not what to expect, were there; but, as its practical needs increased and multiplied, and its ability to pay for what it required became manifest, the new settlement began to attract a safer population.

Even the hopes of the gold-seeker must be fed and clothed at an altitude which acts like the law of natural selection on those who aspire to breathe its thin air, sparing only the sound of heart and lung, and fanning the nerve-fires into breathless, wasteful energy. The producer answered the call of the consumer. Men of all trades followed the miner. The professions followed the trades, and were represented, generally, by men in their youth.

It was, perhaps, this immense, though undisciplined force of sanguine youth which saved the city. The dangerous elements of the camp,—the mud, the weeds and the drift-wood which would have choked a more sluggish current,—were floated and swept onward by its strong tide. The new board sidewalks resounded to the clean step of many an indomitable, bright-faced boy, cadet of some good eastern family, and neophyte in the business of earning a living, with a joyous belief in his own abilities and a clean record to imperil in proving them. The older men, who had come with a slightly shaken faith in themselves, looked half compassion-

ately, half enviously, at these knights of the virgin shield.

It is said that the first woman of the camp crossed the range on foot with her husband, a German miner, and helped him set up the "poor Lar" of their pine-board shanty during the early snows of the first autumn. But those accumulated snows were wasting under the May sun, and the pass, where they still lay deep, could be traced from a long way off—a line of white crossing the purple summit of the range—before the steady migration of wives and children began.

It was a grim sort of nest-building that went on, with discordant chorus of hammer and saw, through the spring and summer and late into the fall of the second year; but, whatever its subsequent troubles may have been, there was a great show of domestic felicity in the camp at this period. Every incoming stage renewed the bridal of some long-separated couple. Each man who could not send for his own wife, sympathized, with boyish gayety, in the regeneration of his more fortunate comrade. The shop-windows moderated their display of velvet riding-habits, embroidered silk stockings, and pink silk *peignoirs* trimmed with cascades of imitation lace,—their temptations to feminine purchasers taking the more domestic form of babies' knitted hoods and sacques, crash toweling, and the newest patterns in cretonne. Every house over which a woman presided practiced a hospitality out of all proportion, in its scope, to the capacities of the rude tabernacle. Every young wife, in her access of happiness, felt a supreme pity for the great army of the unmarried that nightly walked the turbulent streets, between flashes of light from Terpsichorean retreats, and cold glimpses out of the raw city through the open spaces of un-built blocks, toward the snow-lit peaks. Many an unshaven bachelor would have smiled with cheerful scorn at this missionary spirit in his neighbor's wife; a few would have misunderstood it; many profited by it; and many, especially the very young men, went their way, too watchfully absorbed in the keen-edged life of the place to be conscious of any spiritual or social need.

Each night, as the constellations mounted guard above the pass, a redder galaxy lit the dark encampment of hills, where lonely campfires, outposts of the settlement, far up on the wooded slopes, signaled the lights from the active mines, or the flaring beacons of smelting-furnaces in the gulch. Two of these distant human lights, burning on the opposite slopes of a fir-lined cañon, like a river of darkness flowing between them, had a neighborly look of sympathy in their isolation.

The fir-darkened cañon was called Led-Horse Gulch. The lights which beckoned to each other across it shone from the shaft-houses of the Led-Horse and Shoshone mines, between whom, it was said, there was open suspicion on the one side, and bad faith on the other.

## II.

## THE TURNING OF A WINDLASS.

ONE August morning of the cool, autumnal summer, a lady, younger than the youngest of the youthful wives of the camp, whose pure, unsunned complexion proved her but lately arrived, rode down into Led-Horse Gulch from the Shoshone side, and, following the trail upward among the aspens, drew rein at the mouth of a small shaft where two men were working a windlass.

She wore no habit; the plaited skirt of her cloth walking-dress permitted her stirrup-foot to show, and a wide-brimmed straw hat shaded the heightened bloom in her cheek. There was a happy unpremeditation in her dress, and in the vagrant gait of her pony, which might have accounted for this aimless halt at the top of the shaft.

She watched, with idle interest, the taut, wavering rope, as it coiled on the windlass. The men were hoisting a loaded bucket. She appeared indifferent to their respectfully curious glances; they were classified in her mind as part of the novel human machinery of the place. She had a dimly appreciative eye for the fine curves of their powerful backs as they leaned and recovered with the circling cranks that creaked with their weight; otherwise they were not present to her consciousness. From her saddle she could not look far down into the dark hole and see the bucket, just visible one moment, then enlarging rapidly with the shortening rope; nor could she perceive that it was loaded, not with precious ores, but with a bulk of that common human clay of which we are all but metamorphic variations. She was, in fact, less interested in the thing coming up than in the curiously fatalistic manner of its coming. The wavering rope described a shorter and shorter circle; its vibrations ended with a sharp shudder; a few more, slower turns of the crank, and the man had arrived at the surface.

Swinging himself, with a practiced motion, from the bucket to a seat on the collar of the shaft, he looked across at the young girl with undisguised admiration. The look recalled her at once from the vague, impersonal mood of her ride.

The men at the cranks let the bucket down

with a run, straightened their backs and wiped their damp foreheads and necks.

The unembarrassed youth who rose to his feet, taking off his hat with a bright, interrogative smile, was also a part of the human machinery of the place, but his part in relation to the miners at the cranks was that of the throttle-valve rather than the driving-wheels.

The girl acknowledged his salute by a hot blush and the slightest of bows, as she turned her horse's head sharply away from the shaft. Her position in the face of this new element had become untenable, and she abandoned it frankly, making no attempt to explain the unexplainable. It was not her custom (so she indignantly apostrophized her girl's wounded dignity) to be riding about the camp alone, and waiting at prospect-holes for handsome young men to be hoisted out of them! It was an incongruous accident of that incongruous place!

She had, even with her small knowledge of young men, perceived this one's quality in his face and manner; but she suffered from the youthful conviction that her own personality must remain inevitably at the mercy of the moment's accidental disguise.

Guiding her horse confusedly over the broken ground, she was startled by a peremptory shout from behind her.

"Look out there, Abrams! The old shaft!"

A miner coming up the hill, warned by the shout, promptly caught her horse's bridle, and forced him back from a sunken space of fresh earth and stones.

The young man who had given the timely order was now at her side. He picked up her whip. The hat he lifted as he offered it was a very bad one, but the head it did its best to disfigure might have been modeled for the head of a young Jason at the time his personal appearance did him such good service at the court of King Æetes.

"In another second you would have been thrown. This is an old prospect-hole filled with loose earth. Your horse would have sunk in it to his knees," he protested, in answer to her look of vexed surprise.

"I wonder my brother permits such a trap to be uncovered," the girl said, with the emphasis of one who finds unexpected relief in another's responsibility for an awkward situation.

"I have not the pleasure of knowing your brother—but the Led-Horse, I believe, has only one superintendent,"—he took off his hat again with a gayly ironical bow,—“who begs to explain that this hole was filled up to make it safe for foot-passengers, and that the horse-back trail is below. Will you permit me to show it to you?”

THE LED-HORSE IN COUNCIL.

"Am I not on Shoshone ground?" The question was half an assertion.

"I think not. The location stakes follow the gulch, a little on this side of it. You are now about fifty feet within the Led-Horse lines."

The young girl could not help smiling at her own discomfiture, when it had reached this point. She hoped the superintendent of the Led-Horse would pardon her for trespassing and for criticising his management.

The superintendent of the Led-Horse gallantly replied that he could not allow her to call her visit a trespass, and if she liked to ride over his prospect-holes, he would have them all boarded over in that hope.

She made no reply to this somewhat derisive suggestion, and her host of the Led-Horse kept the silence penitently, as he walked at her side through the flickering aspens.

When they had crossed the gulch, he assured her that she was now unmistakably on Shoshone ground, and they parted, with a slightly exaggerated gravity on both sides.

He watched her climbing the hill among the pine trunks that rose rigidly above the fringe of "quaking aspens." Her light figure bent and swayed with her horse's strong upward strides. On the hill-top it was outlined a moment against the fervent blue of the mid-day sky, and then sank out of sight on the other side.

The young superintendent now turned his attention, with a reflected interest, on himself. He looked himself over, in his close-buttoned pea-jacket, and leggings, buckled to his knees, with the cheerful unconcern of a man who is well aware that no tailor's measurements can altogether frustrate those of nature, at her best.

Had Hilgard been born ten or fifteen years sooner, he might have won more honor than he was likely to gain in frontier mining-camps, in the camps and fields of the civil war. He would have been the idol of his men, the life of his mess,—a leader of forlorn hopes and desperate charges. His rich-blooded beauty would have wrung the hearts of susceptible maidens, marking him in the ranks of those about to die, when the regiments for the front marched by in farewell pomp. Like the plume of Navarre, it would have blazed in the thickest of the fight, and would have been quenched, perhaps, on one of those reefs of the dead, which showed, after the battle, where the wildest shocks of assault had met the sternest resistance. It would have marked him a victim without blemish, fit for the sacrifice.

But in the less heroic time in which his lot was cast, and in a crude community of transplanted lives, adjusting themselves to new conditions, Hilgard's excess of good looks was a positive inconvenience. The camp, at that period of its existence, took more thought for its roots than its blossoms. Hilgard's splendid efflorescence was looked upon with a certain suspicion by the sturdy, masculine growths around him. Ugly men, who relied upon their fruits, and felt that nature had disguised them, were not likely to enjoy it. Men with a small personal vanity of their own resented it, as a form of insolence, in their fellow-man. It attracted all the baleful types of womanhood, while many of the feminine bulwarks of respectability in the camp regarded it askance as an apotheosis of the physical life. Not a few of these ladies, especially those whose own personal attractions were not conspicuous, honestly doubted if the virtues of faithfulness and self-denial could be found in conjunction with a lively eye-beam, a short upper lip, a head easily erect above a pair of powerful shoulders, and an exuberance of color and movement expressive of much unused vitality. Whatever general foundation there may be for such a prejudice, the picturesque theories current in the camp reconciling it, in Hilgard's case, with his isolated life and obvious indifference to the social allurements around him, were far from the prosaic truth.

Hilgard's life was as simple and severe in its routine as if nature had clothed his soul in sackcloth instead of purple. It had one im-

mediate object,—the prosperity of the Led-Horse,—to which he considered himself pledged. There was another object, more remote, but more vital and permanent: the education of his two half-brothers,—young lads left to his sole care by the death of both father and mother. Hilgard's own education had been at the mercy of the sad breaks in the lives of those who had watched over it. He was often lonely, as the captain of a bark on a long cruise is lonely in mid-ocean,—but he was in no doubt about his course. He was not restless from uncertainty of purpose. He had a fine, youthful scorn of sudden love, or any sentiment bordering on it. It was his lonely life, perhaps, which gave such prominence in his thoughts to the small incident of the morning. He would hardly have admitted that it was anything in the girl herself. Yet her face and her slender figure, undulating upward to the sunny hill-top, were still vividly before his eyes. He had the keen instinct about women which men lose when they care for them too much. All his latent reverence and idealism had responded to the look in her eyes as they had rested a moment on his. She had blushed, but with a proud, shy girl's disgust at a false position; not helplessly, like a fool, he said to himself. Then he grew hot, thinking of his own careless manner to her, which so ill expressed his sense of her difference from the ordinary pretty girl. If he ever saw her again—of course he would see her again! She was his neighbor, the fair Shoshone—Conrath's sister, whose arrival from the east he had heard of in the camp. Surely she had "snatched a grace" beyond the rules of kinship!

A fragment of a Scotch song, long silent in his memory, woke suddenly, like the first bluebird's note in spring. All the songs and scraps of poetry in which his vagrant moods had been wont to find expression, had been locked in the frosty constriction of his new and perplexing responsibilities:

"O lassie ayont the hill,  
Come ower the tap o' the hill!  
Come ower the tap, wi' the breeze o' the hill,"

—he hummed to himself, as he strode through the aspens that shivered in the sunshine. The smooth-stemmed aspens themselves were not more daintily, slenderly rounded, or more unobtrusive in their clear, cool colors. Hilgard did not like showy girls. He held, with most young men, very positive opinions as to the kind of girl he liked, when in reality it was quality, not kind, that interested him.

"Con, my boy!" he recklessly apostrophized his troublesome neighbor, "you've got

my ore in your ore-bins, but if it came to a settlement for damages, there is metal of yours that is more attractive!"

The next instant he rebuked himself for his profanity. His spirits were rising into rebellious gayety, animated by the dramatic implacability of the circumstances that hedged in his lovely foewoman. He laughed aloud, thinking of the innocent audacity with which she had crossed the contested line, and waited for him at the top of his own shaft.

But the mood did not long abide with him. The first bluebird's note is an uncertain harbinger of spring.

As he climbed the trail to his own side of the gulch and looked across to the Shoshone's shaft-houses, its new ore-sheds, the procession of ore-teams loading at the dumps, and all its encroaching activities in full play, and then reviewed his own empty bins and barren underground pastures, the color of romance died out of the prospect.

He walked back to his office, and took up a package of letters from his desk. The one from the president of his company he opened first. It was an order to shut down!

### III.

#### THE SITUATION.

THE Led-Horse had a somewhat dubious reputation in mining circles. The generally unsatisfactory condition of its affairs might have been described in the words of a clever man's impromptu abstract of life,—“Too poor to pay, too rich to quit.”

It had opened brilliantly, on a promising vein which had been “stoped out” to a considerable depth, and then had become suddenly barren. The ore-bearing rock was there, precisely similar in character to that which had yielded two hundred ounces of silver to the ton, but the silver was not there.

The expenses of the mine rapidly turned its balance the wrong way. There were calls from the home office for retrenchment, and appeals for money from the mine. Its condition was that of a young man who has spent a small patrimony without having fitted himself for earning his own living. It was altogether probable that the capacity for earning a living was there, but it had become necessary that no time should be lost in developing it.

There was a change in the management, even as the young man, in his altered circumstances, turns from the counselors of his days of extravagance, to others, better acquainted with hard work and economy. At this junct-

ure, Hilgard had been sent out with a few thousands to expend in enabling the Led-Horse to support himself, and, if possible, to lay up money in dividends; but the dividends were, as yet, a long way in the future.

Hilgard had had four years' practical experience in mines, but this was his first essay in management. He was well aware that he was making it under great disadvantages. He could not put ore into a barren vein, and a prolonged period of unproductive expenditure in prospecting for ore would, in the event of not finding any, count heavily against him in his opening career. It was inevitable that the manager of a mine should be considered successful according to his fulfillment of the hopes of the owners; especially when the owners were half the width of the continent away, and generally ignorant of the conditions which affect success in the management of mines.

The Shoshone had been in barren rock for many months. It had small capital and less credit, when, a short time after Hilgard's management began, a sudden change took place in the aspect of its affairs. At the change of shifts, a daily increasing number of men were seen around its shaft-houses; new ore-sheds were put up; its long unused wagon-roads became deeply rutted by the heavy ore-teams going and returning from the smelters, and a rumor pervaded the camp that the lucky Shoshones had “struck it away up in the hundreds,” and were shipping ore at the rate of fifty tons a day.

Soon after the Shoshone's prosperity became evident, West, the mining-captain of the Led-Horse, communicated to his chief his suspicion that the Shoshone strike had been made on Led-Horse ground. From the lower drifts, the sounds which came, through the intervening rock, from the new Shoshone workings, indicated, to an experienced ear, that they had crossed the boundary line between the claims.

Hilgard had proposed to Conrath, the superintendent of the Shoshone, that a survey should be made through the Shoshone drifts, but at the expense of the Led-Horse, to prove that the boundary line was intact. He put the whole matter lightly, as a possible mistake which either party might have made. Conrath took it by no means lightly. He even appeared to seize upon it as an occasion for giving expression to a latent feeling of antagonism toward Hilgard, which the latter had not been entirely unconscious of. Conrath refused to admit the possibility of his having crossed the line, or to permit any one to explore the Shoshone workings for any purpose whatever. This unexpected irritability

on the subject could but increase Hilgard's suspicions. The sounds through the rock, which had been at first very faint, having become, day by day, more distinct, Hilgard had started his defensive drift in the direction of these sounds.

The Led-Horse had not as yet achieved its independence of Eastern capital. The few thousands which had been subscribed at the beginning of Hilgard's management had been spent in "prospecting," with no result as yet, except a little low-grade ore and "favorable indications." The small working force of the mine had been concentrated upon the defensive drift, which was in barren rock.

At this juncture, while the mine was dependent on its monthly drafts from the East, the last of these drafts came back dishonored.

It was a time of bitter excitement to Hilgard. Already the unfortunate Led-Horse, with its hopes and its reverses, had become to him almost like some living thing in his care. It was more than a feeling of pride in his work—it was a passionate personification of it,—more especially since he had been beset by treachery without, as well as by poverty within. Hilgard was experiencing the well-known effect of isolation and responsibility upon a concentrated nature cut off from those varied outlets for its energy which the life of cities and large communities affords. The Led-Horse was his ship, on a lee-shore; his fort, cut off, with the sappers at work under its walls; his commander's dispatches in his breast, with the enemies' scouts in hot pursuit, and what succor would be to these, money from the East was to him;—and then came the order to "shut down"! Shut down! Let go the helm, with the breakers under the lee; abandon his countermining, and let the walls fall in; turn back and meet his pursuers, with the precious dispatches in his hands; sit with folded arms in his neighbor's house, while the burglars gutted it!

He wrote long, passionate letters on the situation to the home office, where they awoke trouble and perplexity in the mind of the anxious president, but failed materially to alter the situation.

It was during the sultry weather of early September when these vehement appeals from the desperate executive in the West, poured in on the worried administration in the East.

The Led-Horse proudly boasted in its prospectuses that its stock was "non-assessable." The men who held it were engaged in larger schemes, which made the fate of the Led-Horse of comparatively little consequence. They were scattered far and wide; on board

yachts, at remote fishing and hunting grounds, at watering-places, at home and abroad. To hold a timely meeting of stockholders under these circumstances would have puzzled the most active administration.

It was undeniable that, beyond the office which bore its name, the crisis in the affairs of the Led-Horse made not even a ripple on the "street."

"A draft for two thousand, promptly, will save us!" Hilgard wrote. "Another week will drive the drift through to the Shoshone workings, then we can put up a barricade—shut down—and go into court with a clear case."

The president trusted, in his reply, that the "barricade" would be unnecessary. He deprecated any manifestation in the direction of expected or intended violence. The law alone could decide these points, and with this ultimate decision in view he advised that an injunction be got out against the suspected parties, and evidence collected to support it, while he, in the East would do his best to provide money for conducting the subsequent suit for damages. For the payment of the running expenses, Hilgard must absolutely rely on his own resources, or else shut down. The president concluded by adjuring him to satisfy himself that his suspicion was correct before taking any steps in regard to an injunction.

Hilgard leaned back in his chair. He was mentally replying to the letter he held in his hand.

"The 'resources' I am to depend on are in the hands of the Shoshones,—the proof of my 'suspicion' is there—the evidence for the injunction is there—the question is how am I to get there!" He pushed his chair back impatiently. "Can't they understand that it's impossible to shut down with a gang of men unpaid!"

It had taken a week for his first protest against the order to reach the office; two weeks for repeated letters to make, so it seemed, any impression on that far-off East to which he looked for succor. After three weeks of waiting the reply had come, and it had brought him only into closer contact with a growing dread—a dread of the final resort to those wild counsels of primitive justice, from which he felt the strong recoil which marks the passage from irresponsible boyhood to manhood.

The first overt act was before him which would bring him into sharp personal contact with Conrath. The act was now become inevitable, and whether the truth of his suspicion were proved by it or not, the hostility on Conrath's part would follow with certainty.

He went out into the cool starlight and walked about on the bare space of trodden earth outside his office-door.

At sunset the restless winds, whirling in a dervish-like dance along the highways of the camp, scattering straws and chips and scraps of paper, and sinking as suddenly as they rose, in abject heaps of dust by the road-side, had fainted and died away, as if their souls had departed in the soft breeze that wandered, sighing, up the gulch.

Sounds of music floated up from the camp, where it sparkled like a restless reflection of the night sky in the dark valley below. The lights in the two shaft-houses burned warily, eye to eye, across the gulch.

"O lassie ayont the hill!"—the words which had fitfully recurred in his mind through its late preoccupations, came back now with a wistful note. The sweet lassie had kept on her own side of the hill, and he had never gone over to find her. He had never seen her since she had vanished below the sun-illuminated hill-top.

Where was she to-night?—dancing at the ball of the Younger Sons, perhaps, to that music which came faintly to his ear,—or alone, in the hostile Shoshone camp? Conrath had gone over the range two days ago. He liked better to think of her alone, though it could be no part of his to comfort her. Somehow he did not find the dramatic nature of the situation quite so exhilarating as it had seemed the day of her innocent invasion.

He went down the hill to a little cabin built against its steepest side, where West sat by his fire, moodily smoking and communing with himself after the manner of lonely men.

He was a slenderly built, wiry man, of about thirty, with a nervous mouth and a quiet blue eye, which could kindle quickly, as it did now at the sound of Hilgard's step, and his bright, authoritative voice. He got up and gave his only chair to his young chief, drawing forward an empty powder-keg and seating himself on its inverted bottom. Hilgard lit a cigarette and sat down astride of the chair with his arms across the back. Both men glowered at the fire in silence.

"A letter came from the 'Old Man' to-day," Hilgard presently said. "It's no use, West. The thing is narrowing down to just this—We've got to get into the Shoshone workings."

West looked up quickly.

"If Conrath wont go over the ground with us, we must go over it alone, and take the risk of his catching us in there."

West smoked hard for a minute.

"I could have got in there long ago, sir, if you'd said the word."

"I didn't want to say the word! It's an ugly thing to do—creeping about another man's mine to find out if he's a thief and a liar!"

"Gash can lie; he's an old hand at this game. He made his boast in Deadwood that he could always find plenty of ore as long as his neighbors had any. It's like as not he's fooled Conrath all through. When he struck that streak of ore he couldn't keep from followin' it, any more'n you kin keep a hound off a bear-track. When shall I get in there, sir?"

"You're not going in, West. I'll have a surveyor up from the camp to run the end line across, and get the distance to the Shoshone shaft; then I'll get underground, somehow, with a pocket compass."

"You'd better let me go down, sir."

"It can't be done that way, West. I've got to give my affidavit to get out the injunction. Then we'll drive that drift through, till we can swear what ground we're on!"

"It's a good time to go in now, sir. Conrath's over the range, and Gash has been on a spree. He wont be underground to-morrow, anyhow. How much time would you want?"

"I shall not go in until Conrath is back." Hilgard had risen and stood before the fire, his head well lifted, his cigarette burning out in his fingers.

"I think you might's well take your chance, sir. He'd do it with you, quick enough. It's no fool of a job you're undertakin', Mr. Hilgard."

"I know it, West; but, if I do it at all, I've got to do it my own way—not Conrath's way, or Gashwiler's. I'll take my chances with Conrath on the ground."

#### IV.

#### THE "PRELUDE SOFT."

THE "Younger Sons" celebrated their fortnightly ball that evening in the dining-room of the Colonnade House; the only suggestion of a colonnade in connection with the house being the row of hitching-posts imbedded in the mud of the street before it.

The "Younger Sons" was a select bachelor club, of the highest social aspirations. The sons were not all in their first youth. Some of them, it is to be feared, had known moments which were not those of aspiration; but, as sons go, they represented a tolerable filial average. There might have been something

deprecatory in the modest title they had chosen; at all events, they had found favor with the indulgent mothers of the camp, who accepted their invitations, and danced with them at the fortnightly ball, with the assumed approbation of the fathers.

Hilgard could have been a "Younger Son" had he desired. He had complimentary tickets sent him for the dances, for which unusual attention he was indebted to feminine, if not to maternal, influence. Men were at a discount on these occasions. They stood about in one another's way, and trod on one another's toes, against the wall, in a dreary, superfluous manner, which would have touched the sympathies of women not already overburdened with masculine claimants for them. Hilgard, having been gratuitously chosen as an object of feminine sympathy, would doubtless not have been sent to the wall; but heretofore he had been an unresponsive and ungrateful object. He had given away his ball-tickets, and his dress-suit had remained folded in the bottom of his trunk. To-night, however, at half-past nine o'clock, a visitor who stepped in out of the fresh night air found him sitting at his office-desk, in full evening costume, writing telegrams.

It was a young lawyer of Hilgard's acquaintance, who, after a careless greeting, regarding him critically from a comfortable vantage in front of the fire, remarked:

"Rather more style than the occasion calls for, but you will do very well."

"What occasion?" Hilgard inquired, folding his telegrams.

"A snug little supper at Archer's. It's rather late to ask you; fact is, you weren't included in the first deal. I asked Pitt to meet two Chicago men, just in, but he's gone back on me at the last minute. Have you got something else on hand?"

"I'm going to the Prodigals'." This was the painful perversion which the title of "Younger Sons" had suffered, in unfraternal circles of the camp. "I'm getting rather sick of this crawling about underground. It's a comfort to stretch one's legs, and get on a suit of clothes that isn't decorated in relief with candle-grease."

"Come and stretch your legs under Archer's hospitable board; you won't find any use for them at the Prodigals! You can't get a partner at this hour. Every card in the room is full."

"I may not dance, but I'm going. Shall I send you a substitute?"

"If you can find me a good one; but you'd much better come yourself and eat some trout. The Chicago men will think from your

get-up that Led-Horse stock is booming. I won't tell them your ore is chiefly in the Shoshone bins."

As the legal counsel for the Led-Horse, intimately acquainted with its difficulties, Wilkinson might have been pardoned this jest; but Hilgard flushed, as he replied:

"My get-up is a relic of the past, Wilke. There is not much of the boy left in me, but I'm going to give what there is a chance to-night. To-morrow, to-morrow" — He repented, apparently, of having begun the sentence, and left it frankly unfinished, lifting his head and following with his eyes a ring of smoke that floated upward to the ceiling.

"To-morrow, you'll bid good-by to youth forevermore, eh?" Wilkinson remarked, eyeing the young superintendent with some amusement. "You're expecting your gray hairs by the next stage?"

"I'm expecting Conrath by the next stage. He is doing his best to promote my gray hairs."

"How are you getting on with your testimony?" Wilkinson inquired.

"I'm going to hunt up some to-morrow. Confound it all, it's the worst mess you ever saw. We may have to appeal to the unwritten law after all!"

"That's what you are doing to-night, isn't it,—with the Prodigals' ball for a tribunal? Conrath, I take it, isn't the defendant in this case!"

"I hadn't thought of retaining you for counsel, Wilke," Hilgard retorted. "What time is your supper?"

"Eleven, sharp. The Chicago men want to take in the town a little before they eat."

The two young men rode back to the camp together, and separated at the telegraph office. Hilgard did not enter the ball-room at once, but reconnoitered the scene from the office of the hotel, which communicated with it. Those who were not called to the feast were apt to congregate here, and pick up a few festal crumbs on the threshold.

Hilgard felt roused without being particularly happy. He was not analyzing his mood, or his right to dedicate these few hours, on the eve of an arduous struggle, to his personal claims. He was simply satisfying himself as to whether his fair neighbor of the Shoshone persuasion was among the dancers. Failing to discover her, he stepped within the doorway for a better view, and found himself just behind a lady of his acquaintance, who was participating in the old-fashioned quadrille, then in progress. He was about to change his position when she saw him and began to talk to him in the pauses of her facile performance.

She was a lively little matron, whose six

months' residence in the camp made her a veteran in its society. In spite of a childish face, and light, inconsequent manner, she looked no longer young. The subtle change was like a premature blight on a still full-veined flower. Her youthfully rounded cheek had a slightly crumpled texture, and her eyes, of the blue of childhood, were too widely, restlessly expanded.

"What has brought you here at last, you incorrigible hermit? Or rather, *who* has brought you? You have not deigned to come and dance with us married ladies,—but no sooner——" She was "balancing" to one of the peripatetic partners in "Gentlemen to the left!" and now she was whirled by the tips of her fingers, and finished the sentence, looking at Hilgard over her shoulder as she received the advances of the next—"no sooner do we boast of a lovely young girl from the East, but you are here."

She whirled with Number Two, and continued, with her eyes still on Hilgard, as she turned to Number Three.

"But you are too late for anything but an introduction. It serves you quite right."

Her partner now seized her by both hands and she was swept away in the final "promenade all!"

Hilgard moved on among the ranks of black-coated wall-flowers, but encountered her again as the quadrille broke up. She slipped easily from her late partner's arm to his, and addressed him with the utmost animation, which yet missed, somehow, the full accent of gayety.

"Why don't you ask me to introduce you?"

"To whom, if you please?"

"Ah, what a fraud you are! I can see your eyes wandering about everywhere in search of her. You needn't pretend that you don't know who I mean!"

"I suppose you are talking of your lovely young girl from the East,—but how am I to tell her from the married ladies?" said Hilgard, gazing around in mock bewilderment.

"That's very pretty of you, Mr. Hilgard. I see you are trying to make your peace with me. You know very well that you are talking to her chaperone."

"Am I, indeed?" Hilgard exclaimed, looking down into the upturned face of this guardian of inexperienced youth. "What a fearful responsibility! You look quite worn with it already! Could I possibly be of any assistance to you in your duties?"

"Not the very least, I thank you; I have been enthusiastically assisted already. She's having a perfect 'ovation.' I must say she keeps her head very well for a girl who has been out so little."

"Do you suppose a young girl from the East would call this being 'out'?" Hilgard asked, indifferently. He was quite sure that Mrs. Denny could not possibly be the chaperone of the young girl he had come to see, and was very little moved by this picture of her as a successful candidate for the social honors of the camp.

"Well, I don't know what you would call being 'out,' if this isn't! A perfect wealth of partners, and so cosmopolitan! Why, a girl could dance with a man from every State in the Union!"

Hilgard had never felt a greater distaste for the society of the little person who had so freely bestowed herself upon him, than to-night. He wondered why he did not escape from her. There was a fatality about women of this kind, he had observed, and vaguely questioned whether, as related to social brutality in man, they represented cause or effect.

Mrs. Denny at this moment leaned from his arm with a smile of recognition to a young lady who passed them with the circling promenaders. Her complexion exhibited a rather weather-beaten fairness; her dry, lifeless yellow hair covered her forehead to her eyebrows; the sleeves of her black satin dress were cut very high on the shoulders, giving her the appearance of a perpetual shrug. Her throat and wrists were painfully small, and the hand which fluttered a passing greeting with her fan, had a meager, attenuated expression in pathetic contrast to its gay gesture.

"Is that your young girl from the East?" Hilgard asked, carelessly.

"Mercy, no! Lou Palmer came from the East ten years ago! Lou has had a beautiful time, but she begins to show it a little."

"Is a 'beautiful time' so disastrous in its effects?"

"Well, perhaps Lou has had rather too good a time," said Mrs. Denny, with a reflective air.

"Here is the cynosure!" Hilgard began, then stopped, lifting his head with a quick, characteristic movement, and nervously touching his mustache. In the presence of the girl who stood before him, the light comment died on his lips.

The little crowd of "Younger Sons," which had indicated the force of some central attraction, had parted suddenly, allowing the undoubted object of their homage to pass. She had apparently distinguished none of them with her favor, and her eyes had rather a dazed absence of expression, as she came toward Mrs. Denny.

It was Conrath's sister,—the fair Shoshone, in the white shimmer of her maiden bravery;

her freshness undimmed by the warm, dusty air of the ball, or its miscellaneous homage!

She glanced at Hilgard with doubtful recognition. Then, perceiving the identity of this splendid youth with the clay-covered knight of the prospect-hole, she gave him a slight, cold recognition; too cold for the blush that flamed, like a danger-signal, in her cheek. She proudly repudiated the traitorous color, however, and met his brilliant gaze a moment, quietly, as a lady may.

"I need not introduce you, I see," observed the astute chaperone. "You know Mr. Hilgard, Miss Conrath. He has not honored our poor little dances until to-night. You must help to insure his coming again."

The next dance was forming on the floor. Hilgard, leaning against the whitewashed wall, reckless of his black coat, found himself forgetting all the incongruities of the meeting in the satisfaction it gave him. It was inconceivable that she should be there, in her flower-like brightness, among all these warped or stale humanities. Conrath's admiration of Mrs. Denny was no secret in the camp, but that he should expect his young sister to share it seemed incredible. It was more probable that he had sacrificed his sister's tastes to his own.

However, there she was, and she would be there but a moment! Already, her partner for the dance was industriously searching for her among the promenaders and the groups along the wall. Hilgard made use of his height and breadth of shoulder to defeat this search in an unobtrusive way. He was looking down on the circle of lamp-light which rested on the top of the young girl's head; crossed by a soft line of shadow where the maidenly parting sank out of sight. The drooping, rosy face, turned a little away from him, was in shadow, too, and the small ear, innocent of jewels, glowed as pink as a baby's, warm from the pressure of the pillow.

Her petulance of their first meeting, when she had lost her equanimity as well as her way, was quite gone; the shy alarm of her late greeting had also changed to a soft, surprised air of doubtful confidence, as if among the many alien faces around her she had found in his, so lately repelled, an unexpected, bewildering sympathy. She looked at him again and again, with the brief, wondering glance of a child lost in a crowd, whom some unknown friend has taken by the hand.

Hilgard felt suddenly, deeply sobered. The excitement in his blood, which had been gathering with the thickening plot of his troubles—which had driven him here to-night—climaxed suddenly in her presence. It strung his rich, young voice to the lyric pitch,

controlled by the effort not to meet too eagerly her hesitating preference.

"I wonder if you like a triumph of this kind as much as most girls?" he asked; and felt at once that the question was half an insult.

"Is this a triumph?"

"Oh, no, not this," Hilgard went on desperately, with too keen a perception of the briefness of the passing moment, "but what I have just deprived you of."

"Do you imagine that I liked *that*?" looking at him reproachfully.

"You cannot have anything better than the best the place affords. May I see your card a moment? I shall not even go through the form of asking you for a dance. I only want to satisfy myself that you really have the best." He detached the pendent tassel from her bracelet where it had caught. "Yes," he said, after a moment's grave perusal, "it is a proud record! The flower of the camp have hastened to enroll themselves. I should have been too late an hour ago!"

The inevitable partner was now very warm, indeed, on his quest, and it was no longer possible to frustrate his claims.

Skirting along the wall, fanned by the circling wings of the waltz, Hilgard joined an acquaintance seated in a quiet corner, near the door,—a well-preserved Younger Son, with a fresh-colored face and a humorous, uncertain, exaggerated expression, as if the facial muscles had become weakened in their action, like the keys of a long-used piano. His very respectable name of Thomas Godfrey had been for many years ignored generally by his friends, in favor of the gratuitous title of Doctor. When applied to him, it became, somehow, a familiar and affectionate, rather than a dignified, *nom de plume*.

"Doctor," said Hilgard, "do you want to be an instrument of fate to-night?"

"Of whose fate, George? I've been an instrument of my own fate for fifty odd years;—the result doesn't encourage me to meddle with anybody else's."

"You haven't been passive enough, Doctor. To-night there is a chance for you to be perfectly passive. You've only to change places with me for a few hours,—or let me change with you."

"Heaven forbid!" Godfrey interrupted. "Do you call that being passive?"

"Wait till you hear me. It's a better bargain than you think. I'm too late for a dance, but you can have my supper at Archer's for one of yours, if you'll give me my choice of your partners."

The Doctor fixed Hilgard sternly with his heroi-comic gaze. "I understand your little

theory. Passivity for other folks, while you keep rustling! How many men have you made this offer to before you fell upon me?"

"Doctor, it is only open to you," said Hilgard, with a magnanimous air.

"Perhaps you're in collusion with some young lady in the room—I wouldn't be surprised! You've been studying her card and picked me out, between you, as the most gullible man on her list. George, I'm amazed at your impudence!" The Doctor meditated mournfully upon this quality in Hilgard, who appeared to be a favorite with him.

"Doctor, upon my soul, it's no conspiracy. I happened to see your name on a young lady's card, for a waltz—I know you can't waltz—you must have been out of your mind when you asked her—at this altitude! A good supper never comes amiss to a philosopher like you. I'm considering your interests as well as my own in this proposition."

"Thank you, boy. I'm capable of looking after my own interests, as yet. Out of my mind! At this altitude! Pray, have *you* tried waltzing at this altitude?"

"I've been waltzing up five hundred feet of pump-ladders, three days out of the week for the last six months, at this altitude."

"That's not to the point. I want to know why I shouldn't propose to waltz with a nice girl as well as a thin-waisted young peas-cod like yourself! Do you suppose a man loses his gallantry as he gains in girth? George, I wish you had more stability of character!"

"I've got too much;—that's the trouble with me. I'm getting positively rigid. I came here to-night to limber myself up a little."

"Yes, you need limbering! Come—what is it you do want?"

"I want your waltz, Doctor, and you want my supper: you're hankering for it this minute—I can see it in your eye!"

"What, the supper? I can see it in *your* eye! I don't believe it exists anywhere else."

"Well—not at present, but it will exist at eleven o'clock. A three-handed spread with a dummy,—that is the way it stands now. Wilkinson asked me to take the place of dummy, in default of Pitt, delinquent."

"What was the matter with Pitt? What's the matter with you,—letting a good supper go begging round the camp? There must be something wrong about that supper. Trout, did you say?"

"Oh, yes. There's nothing the matter with Wilkinson's suppers, except the place where he has to give them!"

"Do you mean Archer's?"

"I mean the *place*! How can a man give anything in a place like this?"

"It's a good enough place, if you know

how to take it. You're taking it too hard, my boy,—you're looking thin. Go and eat your own supper! You ought to be a valiant trencher-man at your age!"

"I'm a better waltzer than I am a trencher-man."

"I don't believe you, George. You may be to-night, perhaps. A man's eye don't need to be as bright as yours to enjoy a good supper. It should grow a little tender—soften a little, as his spirit grows compassionate. What's the matter with you, boy? You look as I used to at your age, when I was getting into some awful scrape?"

"Then you'd better keep me out of temptation and go to that supper in my place."

"Look here, George. It *was* a daring thing for me to do!—a man who hasn't waltzed for seven years."

"Seventeen, you mean, Doctor."

The Doctor placidly waved away the interruption.

"I'll tell you how I came to do it. Another man was just going to ask her,—a friend of her brother's. Con ought to be a little more circumspect in his friendships if he's going to turn them all loose upon his sister."

"Well!" Hilgard interrupted impatiently.

"Well! I cut him out! Wasn't it well done, at any risk, eh?"

"It was like you, Doctor."

"No, it wasn't at all like me. It might have been like me at your age—but now, look how I'm weakening! I'm rather inclined to take you up in that offer!"

"Of course you are! It's a perfect arrangement: you defeat Conrath's friend, and reward yourself with a good supper."

"I'm afraid you're too anxious about my reward; however, there's a time for all things. You're in the green tree and I'm in the dry. At your age you wouldn't have got such a bargain out of me, though!"

"Come, don't moralize, Doctor. Eleven, sharp, is your hour. It will take you five minutes to put on your overcoat and ten to find your hat."

"Well, good-night, boy. You're making a foolish bargain, but you'll be twenty years finding it out."

"I shall call it a very good bargain if it wears as long as that."

"You'll make my apologies to the young lady, George?"

"Trust me, Doctor! I'll do it as well as you could—at my age."

It is to be feared that Thomas Godfrey's apologies did not long dwell with those two fateful young souls, drifting so near to each other in the smooth involutions of the dance. Nor could the counter-charm of their bald

and boisterous surroundings avail to reverse the spell, when its rhythmic circles were ended.

The candles in tin sconces against the wall burned dim, with long winding-sheets clinging to them. The lamps smoked in the draughts from the windows, let down to renew the morbid air of the room. As the waltz died, with a piercing bravura of the violins, the stage, belated on the pass, drove noisily up to the hotel entrance. Half the people in the room rushed into the office, or crowded around the doors, to witness the disinterment of a file of bewildered passengers from the damp, close interior of the coach.

The cold night air, tainted with a strong smell of spirits, swept into the room with the current of excitement. There were boisterous masculine greetings, loud laughter, and the tramping of feet on the uncarpeted staircase.

Hilgard and Cecil Conrath were together in a corner of the half-deserted room. The violins were tuning, and the heated trumpeters, with their instruments under their arms, were leaning from their chairs on the platform to accept glasses of refreshment handed up to them from below. The young girl's fair hair was slightly disheveled, and the clear, maidenly parting was blurred by the crossing of innumerable shining filaments, catching the light, and making a dim, wavering crest above her head. A jewel fastened in the folds of her dress rose and fell in the light, as the tide of the dance music ebbed in her breast.

"Are these from the aspens that grow in our gulch?" Hilgard asked, looking down at the pale, yellow leaves that trembled at her belt.

"Yes," she said, speaking with little breathless pauses, "I like them better than the homesick-looking flowers the florists sell. Do you enjoy things that seem to find it so hard to live?"

"No, but I respect them," Hilgard replied.

"But we don't wear flowers out of respect for them; and when there are so many painful things in the world,—to have to sympathize with flowers——"

She looked up for encouragement in her generalization.

Hilgard's encouragement took the form of a silent, unsmiling, downward look, and she referred to her aspens again, rather hastily.

"These little leaves keep shivering in their tough coats, but I believe it is a little affection; they are really quite warm." She shivered herself as she spoke.

"Is that a little affectation too?" Hilgard asked.

"No, it is only somebody walking over the place where my grave will be."

"Suppose you were destined to a sailor's grave—in the bottom of the sea."

"Then it might be a mermaid's step, you know, or a soft-footed seal." Again she gave a little quick shudder.

"It might be; but it is the wind, from that door. Let me fend it, so, with my shoulder."

She rested a moment against the wall in the shelter of the defensive shoulder.

"What is it the boys say when they play marbles. 'Fend' something?" she asked, with nervous gayety.

"Fend dubs?" Hilgard suggested.

"Is it that? I thought it was something prettier!"

"Marbles was not a euphonious game when I played it."

"What does 'fend dubs' mean?" she persisted.

"I will teach you to play marbles, some time, if you wish to learn," Hilgard said, with a deep, impatient inspiration, "but I think you fend very well."

They both laughed and then were silent, seeming to listen to a mental echo of the laugh, and of their light words. The young girl blushed despairingly at her own childish allusion. It sounded rough and slangy to her, in the reproachful silence. The room filled again, suddenly, and the open door was shut. Hilgard resigned his protective attitude, and moved farther away from her. He felt impatient of the people crowding about them; they were helping to confuse those brief moments that lacked so little of perfection. It was like trying to follow the faint thread of a retreating melody through a maze of distracting sounds.

"I will never permit another aspen to be cut on my side of the gulch." It was all he could think of to say. "They shall be sacred to you, from this evening."

"I wish you would let me tell you," she began with a desperate courage, "how it was I came—how I happened to be at the shaft that morning."

"There was no reason why you shouldn't be there."

"Yes, there was. A mine is private property. I know it was altogether queer. I saw that you thought it was, then."

"I was perfectly delighted."

"But I was not there to delight anybody. I simply thought I was on my brother's ground. I was trying a new horse, and just wandering about anywhere."

"I'm afraid I was rather impertinent. I was surprised, I confess, but it was the most charming surprise a man ever had in his life. Forgive me! What did I say to you that morning? Was I very offensive?"

"You were not quite—not as you are to-night."

"Not quite so offensive as I am to-night?"

"You are making fun of me!" she said, with a grieved upward look.

"I could not possibly make fun of you! But what *can* I say? You would not listen a moment to the things I *want* to say!"

She had been nervously fingering the cluster of aspen leaves at her waist, and now one floated from its broken stem softly to the floor. He stooped for it, and held it as if it were a mutual confidence.

"I wish you would forget that morning," she said. "Make believe it did not happen!"

"If you choose to forget it—especially my part of it—I must not complain. But I'm afraid I cannot spare it, unless you will promise me other mornings or evenings—better ones—to make up for it."

He was unconsciously proving a new range of looks and tones which had been silent, heretofore, in the valiant procession of his years. It was the opening of the *vox humana* in his soul. The young girl listened to the "prelude soft"; she sighed, moving her head back restlessly, and with one hand crushing the limp plaitings of lace closer around her throat.

"There will be no more mornings or evenings," she said. "Everything I do here seems to be a mistake. This evening has been the worst mistake of all."

"I know what you mean. We are none of us living our real lives. But there might be perfect things, here—perfect rides and walks and talks—if one were not always alone, or worse than alone."

"But one always is!"

"But *need* one be? We are neighbors"—

"Yes," she interrupted, "but *what* neighbors! Oh, here is Mrs. Denny! I wondered if we were never going home!"

Mrs. Denny came toward them, between two gentlemen, laughing and shivering in a white cloak. Hilgard felt that the hovering joy of the moment had vanished. His account for the evening was closed, with the memory of her last words clouding his spirit. "What neighbors" they were, indeed!

"Didn't you hear the stage drive up, Cecil? Your brother is in at last. He says I may take you home with me to-night, and he will sleep at the hotel. He is completely done up—hasn't even strength enough left to wonder how you got on without him to-night."

"Where is he?" Miss Conrath asked.

"Can't I go to him?"

"He is in bed by this time, my dear. He could scarcely stand on his feet."

"Is he ill?" the girl inquired, anxiously.

"Of course he isn't ill!" Mrs. Denny smiled meaningly at Hilgard behind the young girl's back, and made a little wavering gesture back and forth with her small, wise forefinger. "Can't you imagine what twenty hours in that coach must be?" she added.

"I don't need to imagine—I know!" Cecil said.

"Well then! you cannot wonder he is fit for nothing but his bed!"

At the ladies' entrance—a recent addition to the Colonnade which could not be regarded as a triumph of privacy—Mr. Denny met them, and silently offered his arm to Miss Conrath, as if he had come for that purpose alone. He had spent the evening in a semi-detached state of attendance on his wife, varied by brief distractions of his own. Mrs. Denny gave him a quick, hard glance, when he first presented himself, perhaps to ascertain the nature of these distractions from their effects, but without altering her vivacity of manner.

(To be continued.)

## "DAY UNTO DAY UTTERETH SPEECH."

THE speech that day doth utter, and the night,  
Full oft to mortal ears it hath no sound.

Dull are our eyes to read, upon the ground,  
What's written there: and stars are hid by light.  
So, when the dark doth fall, awhile our sight

Kens the unwonted orbs that circle round,

Then quick in sleep our human sense is bound,—  
Speechless for us the starry heavens and bright.  
But, when the day doth close, there is one word

That's writ amid the sunset's golden embers,

And one at morn; by them our minds are stirred:

Splendor of Dawn—and Evening that remembers,—

These are the rhymes of God; thus, line on line,

Our hearts are moved to thoughts that are divine.

R. W. G.

## THROUGH ONE ADMINISTRATION.\*

BY FRANCES HODGSON BURNETT,

Author of "That Lass o' Lowrie's," "Haworth's," "Louisiana," "A Fair Barbarian," etc., etc.

### CHAPTER XXII.

It was generally conceded that nothing could be more agreeable than Mrs. Sylvestre's position and surroundings. Those of her acquaintance who had known her before her marriage, seeking her out, pronounced her more full of charm than ever; those who saw her for the first time could scarcely express with too much warmth their pleasure in her grace, gentleness, and beauty. Her house was only less admired than herself, and Mrs. Merriam, promptly gathering a coterie of old friends about her, established herself most enviably at once. It became known to the world, through the medium of the social columns of the dailies, that Mrs. Sylvestre was at home on Tuesday afternoons, and that she also received her friends each Wednesday evening. On these occasions her parlors were always well filled, and with society so agreeable that it was not long before they were counted among the most attractive social features of the week. Professor Herrick himself appeared on several Wednesdays, and it was gradually remarked that Colonel Tredennis presented himself upon the scene more frequently than their own previous knowledge of his habits would have led the observers to expect. On seeing Mrs. Sylvestre in the midst of her guests and admirers, Miss Jessup was reminded of Madame Récamier and the *salons* of Paris, and wrote almost an entire letter on the subject, which was printed by the "Wabash Times," under the heading of "A Recent Récamier," and described Mrs. Sylvestre's violet eyes, soft voice, and willowy figure, with nothing short of enthusiasm.

Under these honors Mrs. Sylvestre bore herself very calmly. If she had a fault, an impetuous acquaintance once remarked, it was that she was too calm. She found her life even more interesting than she had hoped it would be; there was pleasure in the renewal of old friendships and habits and the formation of new ones, and in time it became less difficult to hold regrets and memories in check with a steady hand. She neither gave herself to retrospection nor to feverish

gayety; she felt she had outlived her need of the latter and her inclination for the former. Without filling her life with excitement, she enjoyed the recreations of each day as they came, and felt no resulting fatigue. When Professor Herrick came to spend an evening hour with her and sat by the fire gently admiring her as he was led on to talk, and also gently admiring Mrs. Merriam, who was in a bright, shrewd humor, she herself was filled with pleasure in them both. She liked their ripeness of thought and their impartial judgment of the life whose prejudices they had outlived. And as genuinely as she liked this she enjoyed Colonel Tredennis, who now and then came too. In the first place, he came because he was asked, but afterward because, at the end of his first visit, he left the house with a sense of being in some vague way the better for it. Agnes's manner toward him had been very kind. She had shown an interest in himself and his pursuits which had somehow beguiled him out of his usual reticence and brought the best of his gifts to the surface, though nothing could have been more unstrained and quiet than the tone of their conversation. He was at no disadvantage when they talked together; he could keep pace with her and understand her gentle thoughts; she did not bewilder him or place him on the defensive. Once, as he looked at her sweet, reposeful face, he remembered what Bertha had said of his ideal woman and the thought rose in his mind that this was she—fair, feminine, full of all tender sympathy and kindly thought; not ignorant of the world nor bitter against it, only bearing no stain of it upon her. "All women should be so," he thought, sadly. And Agnes saw the shadow fall upon his face, and wondered what he was thinking of.

She began to speak to him of Bertha soon afterward, and, perhaps, if the whole truth were told, it was while she so spoke that he felt her grace and sweetness most movingly. The figure her words brought before him was the innocent one he loved, the one he only saw in memory and dreams, and whose eyes followed him with an appeal which was sad

truth itself. At first Agnes spoke of the time when they had been girls together, making their *entrée* into society, with others as young and untried as themselves—Bertha the happiest and brightest of them all.

"She was always a success," she said. "She had that quality. One don't know how to analyze it. People remembered her and were attracted, and she never made them angry or envious. Men who had been in love with her remained her friends. It was because she was so true to them. She was always a true friend."

She remembered so many incidents of those early days, and in her relation of them Bertha appeared again and again the same graceful, touching young presence, always generous and impetuous, ready of wit, bright of spirit, and tender of heart.

"We all loved her," said Agnes. "She was worth loving; and she is not changed."

"Not changed," said Tredennis, involuntarily.

"Did you think her so?" she asked gently.

"Sometimes," he answered, looking down. "I am not sure that I know her very well."

But he knew that he took comfort with him when he went away, and that he was full of heartfelt gratitude to the woman who had defended him against himself. When he sat among his books that night his mind was calmer than it had been for many a day, and he felt his loneliness less. What wonder that he went to the house again and again, and oftener to spend a quiet hour than when others were there. When his burdens weighed most heavily upon him, and his skies looked darkest, Agnes Sylvestre rarely failed to give him help. When he noted her thoughtfulness for others, he did not know what method there was in her thoughtfulness for himself, and with what skillful tact and delicate care she chose the words in which she spoke to him of Bertha; he only felt that, after she had talked to him, the shadow which was his companion was less a shadow, and more a fair truth to be believed in and to draw faith and courage from.

The Professor, who met him once or twice during his informal calls, spoke of the fact to Arbuthnot with evident pleasure.

"He was at his best," he said, "and I have noticed that it is always so when he is there. The truth is, it would be impossible to resist the influence of that beautiful young woman."

His acquaintance with Mr. Arbuthnot had taken upon itself something of the character of an intimacy. They saw each other almost daily. The Professor had indeed made many

discoveries concerning the younger man, but none which caused him to like him less. He had got over his first inclination toward surprise at finding they had many things in common, having early composed himself to meet with calmness any source of momentary wonder which might present itself, deciding at length that he himself was either younger or his new acquaintance older than he had imagined, without making the matter an affair of years. The two fell into a comfortable habit of discussing the problems of the day, and, though their methods were entirely different, and Arbuthnot was, at the outset, much given to a light treatment of argument, they always understood each other in the end, and were drawn a trifle nearer by the debate. It was actually discovered that Laurence had gone so far as to initiate the unwary Professor into the evil practice of smoking, having gradually seduced him by the insidious temptings of the most delicate cigars. The discussions, it was observed, were always more enjoyable when the Professor, having his easy-chair placed in exactly the right position with regard to light and fire, found himself with his cigar in hand, carefully smoking it and making the most of its aroma. His tranquil enjoyment of and respect for the rite were agreeable things to see.

"It soothes me," he would say to Arbuthnot. "It even inspires and elevates me. I feel as if I had discovered a new sense. I am really quite grateful."

It was Arbuthnot who generally arranged his easy-chair, showing a remarkable instinct in the matter of knowing exactly what was necessary to comfort. Among his discoveries concerning him the Professor counted this one that he had in such things the silent quickness of perception and deft-handedness of a woman, and perhaps it had at first surprised him more than all else.

It may have been for some private reason of his own that the Professor occasionally gave to the conversation a lighter tone, even giving a friendly and discursive attention to social topics, and showing an interest in the doings of pleasure-lovers and the butterfly of fashion. At such times Arbuthnot noticed that, beginning with a reception at the British Embassy, they not unfrequently ended with Bertha; or, opening with the last dinner at the White House, closed with Richard and the weekly "evenings" adorned by the presence of Senator Planefteld and his colleague. So it was perfectly natural that they should not neglect Mrs. Sylvestre, to whom the Professor had taken a great fancy, and whose progress he watched with much interest. He frequently spoke of her to Arbuth-

not, dwelling upon the charm which made her what she was, and analyzing it and its influence upon others. It appeared to have specially impressed itself upon him on the occasion of his seeing Tredennis, and, having said that it would be impossible to resist this "beautiful young woman,"—as he had fallen into the unconscious habit of calling her—he went on to discourse further.

"She is too tranquil to make any apparent effort," he said. "And yet the coldest and most reserved person must be warmed and moved by her. You have seen that—though you are neither the most reserved nor the coldest."

Arbuthnot was smoking the most perfectly flavored of cigars, and giving a good deal of delicate attention to it. At this he took it from his mouth, looked at the end, and removed the ash with a touch of his finger, in doing which he naturally kept his eyes upon the cigar and not upon the Professor.

"Yes," he said, "I have recognized it, of course."

"You see her rather often, I think?" said the Professor.

"I am happy to be permitted that privilege," was the answer; "though I am aware I am indebted for it far more to Mrs. Amory than to my own fascinations—numberless and powerful though they may be."

"It is a privilege," said the Professor, "but it is more of one to Philip than to you—even more of one than he knows. He needs what such a woman might give him."

"Does he?" said Arbuthnot. "Might I ask what that is?"

And he was angry with himself because he did not say it with more ease and less of a sense of unreasonable irritation. The Professor seemed to forget his cigar, he held it in the hand which rested on his chair-arm, and neglected it while he gave himself up to thought.

"He has changed very much during the past year," he said. "In the last few months I have noticed it specially. I miss something from his manner, and he looks fagged and worn. It has struck me that he rather needs an interest, and feels his loneliness without being conscious that he does so. After all, it is only natural. A man who leads an isolated life inevitably reaches a period when his isolation wearies him, and he broods over it a little."

"And you think," said Arbuthnot, "that Mrs. Sylvestre might supply the interest?"

"Don't you think so yourself?" suggested the Professor, mildly.

"Oh," said Laurence, "I think the man would be hard to please who did not find she

could supply him with anything and everything."

And he laughed and made a few rings of smoke, watching them float upward toward the ceiling.

"He would have a great deal to bring her," said the Professor, speaking for the moment rather as if to himself than to any audience. "And she would have a great deal in return for what she could bestow. He has always been what he is to-day, and only such a man is worthy of her. No man who had trifled with himself and his past could offer what is due to her."

"That is true," said Laurence.

He made more rings of smoke and blew them away.

"As for Tredennis," he said with a deliberateness he felt necessary to his outward composure, "his advantage is that he does not exactly belong to the nineteenth century. He has no place in parlors; when he enters one without the least pretension or consciousness of himself, he towers over the rest of us with a gigantic modesty it is useless to endeavor to bear up against. He ought to wear a red cross, and carry a battle-ax, and go on a crusade, or right the wrongs of the weak by unhorsing the oppressor in single combat. He might found a Round Table. His crush hat should be a helmet, and he should appear in armor."

The Professor smiled.

"That is a very nice figure," he said, "though you don't treat it respectfully. It pleases my fancy."

Arbuthnot laughed again, not the gayest laugh possible.

"It is he who is a nice figure," he returned. "And though he little suspects it, he is the one most admired of women. He could win anything he wanted and would deserve all he won. Oh, I'm respectful enough. I'm obliged to be. There's the rub!"

"Is it a rub?" asked the Professor, a little disturbed by an illogical fancy which at the moment presented itself without a shadow of warning.

"You don't want the kind of thing he might care for."

This time Laurence's laugh had recovered its usual delightful tone. He got up and went to the mantel for a match to light a new cigar.

"I!" he said. "I want nothing but the assurance that I shall be permitted to retain my position in the Treasury until I don't need it. It is a modest ambition, isn't it? and yet I am afraid it will be thwarted. And then—in the next administration, perhaps—

I shall be seedy and out at elbows, and Mrs. Amory wont like to invite me to her Thursday evenings, because she will know it will make me uncomfortable, and then—then I shall disappear.”

“Something has disturbed you,” commented the Professor, rather seriously. “You are talking nonsense.”

And as he said it, the thought occurred to him that he had heard more of that kind of nonsense than usual of late, and that the fact was likely to be of some significance. “It is the old story,” he thought, “and it is beginning to wear upon him until he does not control himself quite so completely as he did at first. That is natural too. Perhaps Bertha herself has been a little cruel to him in her woman’s way. She has not been bearing it so well either.”

“My dear Professor,” said Laurence, “everything is relative, and what you call nonsense I regard as my most successful conversational efforts. I could not wield Excalibur. Don’t expect it of me, I beg you.”

If he had made an effort to evade any further discussion of Mrs. Sylvestre and the possibilities of her future, he had not failed in it. They talked of her no more—in fact, they talked very little at all. A shade had fallen upon the Professor’s face and did not pass away. He lighted his cigar again, but scarcely seemed to enjoy finishing it. If Arbuthnot had been in as alert a mental condition as usual, his attention would have been attracted by the anxious thoughtfulness of his old friend’s manner; but he himself was preoccupied and rather glad of the opportunity to be silent. When the cigars were finished and he was on the point of taking his departure, the Professor seemed to rouse himself as if from a reverie.

“That modest ambition of yours ——” he began slowly.

“Thank you for thinking of it,” said Arbuthnot, as he paused.

“It interests me,” replied the Professor, “You are continually finding something to interest me. There is no reason why it should be thwarted, you know.”

“I wish I did,” returned Laurence. “But I don’t, you see. They are shaky pieces of architecture, those Government buildings. The foundation-stones are changed too often to insure a sense of security to the occupants. No; my trouble is that I don’t know.”

“You have a great many friends,” said the Professor.

“I have a sufficient number of invitations to make myself generally useful,” said Laurence, “and of course they imply an appreciation of my social gifts which gratifies me;

but a great deal depends on a man’s wardrobe. I might as well be without talents as minus a dress-coat. It interests me sometimes to recognize a brother in the ‘song and dance artist’ who is open to engagements. I, my dear Professor, am the ‘song and dance artist.’ When I am agile and in good voice, I am recalled; but they would not want me if I were hoarse and out of spirits, and had no spangles.”

“You might get something better than you have,” said the Professor, reflectively. “You ought to get something better.”

To whom shall I apply?” said Laurence. “Do you think the President would receive me to-morrow? Perhaps he has already mentioned his anxiety to see me.” Then, his manner changing, he added, with some hurry: “You are very good, but I think it is no use. The mistake was in letting myself drift as I did. It would not have happened if—if I hadn’t been a fool. It was my own fault. Thank you! Don’t think of me. It wouldn’t pay me to do it myself, and you may be sure it would not pay you.”

And he shook the Professor’s hand and left him.

He was not in the best of humors when he reached the street, and was obliged to acknowledge that of late the experience had not been as rare a one as discretion should have made it. His equable enjoyment of his irresponsible existence had not held its own entirely this winter. It had been disturbed by irrational moods and touches of irritability. He had broken, in spite of himself, the strict rules he had laid down against introspection and retrospection; he had found himself deviating in the direction of shadowy regrets and discontents. And this in the face of the fact that no previous season had presented to him greater opportunities for enjoyment than this one. Certainly he counted as the most enviable of his privileges those bestowed upon him by the inmates of the new establishment in Lafayette Place. His intimacy with the Amorys had placed him upon a more familiar footing than he could have hoped to attain under ordinary circumstances, and, this much gained, his social gifts and appreciation of the favor shown him did the rest.

“Your Mr. Arbuthnot,” remarked Mrs. Merriam, after having conversed with him once or twice, “or, I suppose, I ought rather to say little Mrs. Amory’s Mr. Arbuthnot, is a wonderfully suitable person.”

“Suitable?” repeated Agnes. “For what?”  
“For anything—for everything. He would never be out of place, and his civility is absolute genius.”

Mrs. Sylvestre's smile was for her relative's originality of statement, and apparently bore not the slightest reference to Mr. Arbuthnot himself.

"People are never entirely impersonal," Mrs. Merriam went on. "But an appearance of being so may be cultivated, as this gentleman has cultivated his, until it is almost perfection. He never projects himself into the future. When he picks up your handkerchief, he does not appear to be thinking how you will estimate his civility; he simply restores you an article you would miss. He does nothing with an air, and he never forgets things. Perhaps the best part of his secret is that he never forgets himself."

"I am afraid he must find that rather tiresome," Agnes remarked.

"My dear," said Mrs. Merriam, "no one could forget herself less often than you do. That is the secret of your repose of manner. Privately you are always on guard, and your unconsciousness of the fact arises from the innocence of youth. You are younger than you think."

"Ah!" said Mrs. Sylvestre, rising and crossing the room to move a yellow vase on the top of a cabinet, "don't make me begin life over again."

"You have reached the second stage of existence," said the older woman, her bright eyes sparkling. "There are three: the first when one believes everything is white; the second when one is sure everything is black; the third when one knows that the majority of things are simply gray."

"If I were called upon to find a color for your favorite," said Agnes, bestowing a soft, abstracted smile on the yellow vase. "I think I should choose gray. He is certainly neutral."

"He is a very good color," replied Mrs. Merriam; "the best of colors. He matches everything—one's tempers, one's moods, one's circumstances. He is a very excellent color, indeed."

"Yes?" said Agnes, quietly.

And she carried her vase to another part of the room, and set it on a little ebony stand.

It had become an understood thing, indeed, that her relative found Laurence Arbuthnot entertaining, and was disposed to be very gracious toward him. On his part, he found her the cleverest and most piquant of elderly personages. When he entered the room where she sat it was her habit to make a place for him at her own side, and to enjoy a little agreeable gossip with him before letting him go. After they had had a few such conversations together, Arbuthnot began to discover that his replies to her references to

himself and his past had not been so entirely marked by reticence as he had imagined when he had made them. His friend had a talent for putting the most adroit leading questions, which did not betray their significance upon the surface; and once or twice, after answering such a one, he had seen a look in her sparkling old eyes which led him to ponder over his own words as well as hers. Still she was always astute and vivacious, and endowed him for the time being with a delightful sense of being at his best, for which he was experienced enough to be grateful. He had also sufficient experience to render him alive to the fact that he preferred to be at his best when it was his good fortune to adorn this particular drawing-room with his presence. He knew before long that when he had made a speech upon which he privately prided himself, after the manner of weak humanity, he found it agreeable to be flattered by the consciousness that Mrs. Sylvestre's passion-flower colored eyes were resting upon him with that delicious suggestion of reflection. He was not rendered happier by the knowledge of this susceptibility, but he was obliged to admit its existence in himself. Few men of his years were as little prone to such natural weaknesses, and he had not attained his somewhat abnormal state of composure without paying its price. And yet he had begun life with a large enough capital of fancy and emotion. Perhaps the capital had been too large.

"If one has less, one is apt to be more economical," Bertha had heard him remark, "and at least retain a small annuity to exist upon in one's maturer years. I did not retain such an annuity."

Certainly there was one period of his life upon which he never looked back without a shudder; and this being the case, he had taught himself, as time passed, not to look back upon it at all. He had also taught himself not to look forward, finding the one almost as bad as the other. As Bertha had said, he was not fond of affairs, and even his enemies were obliged to admit that he was ordinarily too discreet or too cold to engage in the most trivial of such agreeable entanglements.

"If I pick up a red-hot coal," he said, "I shall burn my fingers, even if I throw it away quickly. Why should a man expose himself to the chance of being obliged to bear a blister about with him for a day or so? If I may be permitted, I prefer to stand before the fire and enjoy an agreeable warmth without personal interference with the blaze."

Nothing could have been farther from his intentions than interference with the blaze,

where Mrs. Sylvestre was concerned; though he had congratulated himself upon the glow her grace and beauty diffused, certainly no folly could have been nearer akin to madness than such folly, if he had been sufficiently unsophisticated to indulge in it. And he was not unsophisticated—few men were less so. His perfect and just appreciation of his position bounded him on every side, and it would have been impossible for him to lose sight of it. He had never blamed any one but himself for the fact that he had accomplished nothing particular in life, and had no prospect of accomplishing anything. It had been his own fault, he had always said; if he had been a better and stronger fellow, he would not have been beaten down by one blow, however sharp and heavy. He had given up because he chose to give up and let himself drift. His life since then had been agreeable enough; he had had his moments of action and reaction, he had laughed one day and felt a little glum the next, and had let one mood pay for the next, and trained himself to expect nothing better. He had not had any inclination for marriage, and had indeed frequently imagined that he had a strong disinclination for it; his position in the Amory household had given him an abiding-place, which was like having a home without bearing the responsibility of such an incumbrance.

"I regard myself," Bertha sometimes said to him, "as having being a positive boon to you. If I had not been so good to you, there would have been moments when you would have almost wished you were married. And if you had had such moments, the day of your security would have been at an end."

"Perfectly true," he invariably responded, "and I am grateful accordingly."

He began to think of this refuge of his, after he had walked a few minutes. He became conscious that, the longer he was alone with himself, the less agreeable he found the situation. There was a sentence of the Professor's which repeated itself again and again, and made him feel restive; somehow, he could not rid himself of the memory of it.

"No man who had trifled with himself and his past could offer what is due to her." It was a simple enough truth, and he found nothing in it to complain of; but it was not an exhilarating thing to dwell upon and be haunted by.

He stopped suddenly in the street and threw his cigar away. A half laugh broke from him.

"I am resenting it," he said. "It is making me as uncomfortable as if I was a human being, instead of a mechanical invention in

the employ of the Government. My works are getting out of order. I will go and see Mrs. Amory; she will give me something to think of. She always does."

A few minutes later he entered the familiar parlor. The first object which met his eye was the figure of Bertha, and, as he had anticipated would be the case, she gave him something to think of. But it was not exactly the kind of thing he had hoped for, though it was something, it is true, which he had found himself confronted with once or twice before. It was something in herself, which on his first sight of her presented itself to him so forcibly that it gave him something very near a shock.

He had evidently broken in upon some moment of absorbed thought. She was standing near the mantel, her hands clasped behind her head, her eyes seeming fixed on space. The strangeness of her attitude struck him first, and then the unusualness of her dress, whose straight, long lines of unadorned black revealed, as he had never seen it revealed before, the change which had taken place in her.

She dropped her hands when she saw him, but did not move toward him.

"Did you meet Richard?" she said.

"No," he replied. "Did he want to see me?"

"He said something of the kind, though I am not quite sure what it was."

Their eyes rested on each other as he approached her. In the questioning of hers there was a touch of defiance, but he knew its meaning too well to be daunted by it.

"I would not advise you to wear that dress again," he said.

"Why not?" she asked.

"Go to the mirror and look at yourself," he said.

She turned, walked across the room with a slow, careless step, as if the effort was scarcely worth while. There was an antique mirror on the wall, and she stopped before it and looked herself over.

"It isn't wise, is it?" she said. "It makes me look like a ghost. No it doesn't *make* me look like one; it simply shows me as I am. It couldn't be said of me just now that I am at my best, could it?"

Then she turned around.

"I don't seem to care!" she said. "*Don't* I care? That would be a bad sign in *me*, wouldn't it?"

"I should consider it one," he answered. "It is only in novels that people can afford not to care. You cannot afford it. Don't wear a dress again which calls attention to the fact that you are so ill and worn as to

seem only a shadow of yourself. It *isn't* wise."

"Why should one object to being ill?" she said. "It is not such a bad idea to be something of an invalid, after all; it insures one a great many privileges. It is not demanded of invalids that they shall always be brilliant. They are permitted to be pale, and silent and heavy-eyed, and lapses are not treasured up against them." She paused an instant. "When one is ill," she said, "nothing one does or leaves undone is of any special significance. It is like having a holiday."

"Do you want to take such a holiday?" he asked. "Do you need it?"

She stood quite still a moment, and he knew she did it because she wished to steady her voice.

"Sometimes," she said at last, "I think I do."

Since he had first known her there had been many times when she had touched him without being in the least conscious that she did so. He had often found her laughter as pathetic as other people's tears, even while he had joined in it himself. Perhaps there was something in his own mood which made her seem in those few words more touching than she had ever been before.

"Suppose you begin to take it now," he said, "while I am with you."

She paused a few seconds again before answering. Then she looked up.

"When people ask you how I am," she said, "you might tell them that I am not very well, that I have not been well for some time, and that I am not getting better."

"Are you getting—worse?" he asked.

Her reply—if reply it was—was a singular one. She pushed the sleeve of her black dress a little away from her wrist, and stood looking down at it without speaking. There were no bangles on the wrist this morning, and without these adornments its slenderness seemed startling. The small, delicate bones marked themselves, and every blue vein was traceable.

Neither of them spoke, and in a moment she drew the sleeve down again, and went back to her place by the fire. To tell the truth, Arbuthnot could not have spoken at first. It was she who at length broke the silence, turning to look at him as he sat in the seat he had taken, his head supported by his hand.

"Will you tell me," she said, "what has hurt you?"

"Why should you ask that?" he said.

"I should be very blind and careless of you if I had not seen that something had happened to you," she answered. "You are

always caring for me, and—understanding me. It is only natural that I should have learned to understand you a little. This has not been a good winter for you. What is it, Larry?"

"I wish it was something interesting," he answered, "but it is not. It is the old story. I am out of humor. I'm dissatisfied. I have been guilty of the folly of not enjoying myself on one or two occasions, and the consciousness of it irritates me."

"It is always indiscreet not to enjoy oneself," she said.

And then there was silence for a moment, while she looked at him again.

Suddenly she broke into a laugh—a laugh almost hard in its tone. He glanced up to see what it meant.

"Do you want to know what makes me laugh?" she said. "I am thinking how like all this is to an old-fashioned tragedy, where all the *dramatis personæ* are disposed of in the last act. We go over one by one, don't we? Soon there will be no one left to tell the tale. Even Colonel Tredennis and Richard show signs of their approaching doom. And you—some one has shown you your dagger, I think, and you know you cannot escape it."

"I am the ghost," he answered; "the ghost who was disposed of before the tragedy began, and whose business it is to haunt the earth, and remind the rest of you that once I had blood in my veins too."

He broke off suddenly and left his seat. The expression of his face had altogether changed.

"We always talk in this strain," he exclaimed. "We are always jeering! Is there anything on earth—any suffering or human feeling, we could treat seriously? If there is, for God's sake let us speak of it just for one hour."

She fixed her eyes on him, and there was a sad little smile in their depths.

"Yes, you have seen your dagger," she said. "You have seen it. Poor Larry! Poor Larry!"

She turned away and sat down, clasping her hands on her knee, and he saw that suddenly her lashes were wet, and thought that it was very like her that, though she had had no tears for herself, she had them for him.

"Don't be afraid that I will ask you any questions," she said. "I won't. You never asked me any. Perhaps words would not do you any good."

"Nothing would do me any good just now," he answered. "Let it go at that. It mayn't be as bad as it seems just for the moment—such things seldom are. If it gets really

worse, I suppose I shall find myself coming to you some day to make my plaint; but it's very good in you to look at me like that. And I was a fool to fancy I wanted to be serious. I don't, on the whole."

"No, you were not a fool," she said. "There is no reason why *you* should not be what you want. Laurence," with something like sudden determination in her tone, "there is something I want to say to you."

"What is it?" he asked.

"I have got into a bad habit lately," she said, "a bad habit of thinking. When I lie awake at night——"

"Do you lie awake at night?" he interrupted.

She turned her face a little away, as if she did not wish to meet his inquiring gaze.

"Yes," she answered, after a pause. "I suppose it is because of this—habit. I can't help it—but it doesn't matter."

"Oh," he exclaimed, "it does matter! You can't stand it."

"Is there anything people 'cannot stand?' " she said. "If there is, I should like to try it."

"You may well look as you do," he said.

"Yes, I may well," she answered. "And it is the result of the evil practice of thinking. When once you begin, it is not easy to stop. And I think you have begun."

"I shall endeavor to get over it," he replied.

"No," she said, "don't!"

She rose from her seat and stood up before him, trembling, and with two large tears fallen upon her cheeks.

"Larry," she said, "that is what I wanted to say—that is what I have been thinking of. I shall not say it well, because we have laughed at each other so long that it is not easy to speak of anything seriously; but I must try. See! I am tired of laughing. I have come to the time when there seems to be nothing left but tears—and there is no help; but you are different, and if you are tired too, and if there is anything you want, even if you could not be sure of having it, it would be better to be trying to earn it—and to be worthy of it."

He rested his forehead on his hands, and kept his eyes fixed on the carpet.

"That is a very exalted way of looking at things," he said, in a low voice. "I am afraid I am not equal to it."

"In the long nights, when I have lain awake and thought so," she went on, "I have seemed to find out that—there were things worth altering all one's life for. I did not want to believe in them at first, but now it is different with me. I could not say so to any

one but you—and perhaps not to you to-morrow or the day after—and you will hear me laugh and jeer many a time again. That is my fate—but it need not be yours. Your life is your own. If mine were my own—oh, if mine were my own!" She checked the passionate exclamation with an effort. "When one's life belongs to oneself," she added, "one can do almost anything with it!"

"I have not found it so!" he replied.

"You have never tried," she said. "One does not think of these things until the day comes when there is a reason—a reason for everything—for pain and gladness, for hope and despair, for the longing to be better and the struggle against being worse. Oh! how can one give up when there is such a reason, and one's life is in one's own hands. I am saying it very badly, Larry, I know that. Agnes Sylvestre could say it better, though she could not mean it more."

"She would not take the trouble to say it at all," he said.

Bertha drew back a pace with an involuntary movement. The repressed ring of bitterness in the words had said a great deal.

"Is it——?" she exclaimed involuntarily as she had moved and then stopped. "I said I would not ask questions," she added, and clasped her hands behind her back, standing quite still in an attitude curiously expressive of agitation and suspense.

"What!" he said, "have I told you? I was afraid I should. Yes, it is Mrs. Sylvestre who has disturbed me—it is Mrs. Sylvestre who has stirred the calm of ages."

She was silent a second, and when she spoke her eyes looked very large and bright.

"I suppose," she said slowly, "that it is very womanish in me—that I should almost wish it had been some else."

"Why?" he asked.

"You *all* have been moved by Mrs. Sylvestre," she replied, more slowly than before—"all of you."

"How many of us are there?" he inquired.

"Colonel Tredennis has been moved too," she said. "Not long before you came in, he paid me a brief visit. He does not come often now, and his visits are usually for Janey, and not for me. I displeased him the night he went with me to the reception of the Secretary of State and he has not been able to resign himself to seeing me often; but this evening he came in, and we talked of Mrs. Sylvestre. He had been calling upon her, and her perfections were fresh in his memory. He finds her beautiful and generous and sincere; she is not frivolous or capricious. I think that was what I gathered

from the few remarks he made. I asked him questions—you see, I wanted to know. And she has this advantage—she has all the virtues which the rest of us have not.”

“You are very hard on Tredennis sometimes,” he said, answering in this vague way the look on her face which he knew needed answer.

“Sometimes,” she said—“sometimes he is hard on me.”

“He has not been easy on *me* to-day,” he returned.

“Poor Larry!” she said again. “Poor Larry!”

He smiled a little.

“You see what chance I should be likely to have against such a rival,” he said. “I wonder if it ought to be a consolation to me to reflect that my position is such that it cannot be affected by rivals. If I had the field to myself, I should stand exactly where I do at this moment. It saves me from the risk of suffering, don’t you see? I know my place too well to allow myself to reach that point. I am uncomfortable only because circumstances have placed it before me in a strong light, and I don’t like to look at it.”

“What is your place?” she asked.

“It is in the Treasury,” he replied. “The salary is not large. I am slightly in debt—to my tailor and hosier, who are, however, patient, because they think I am to be relied on through this administration.”

“I wish I knew what to say to you!” she exclaimed. “I wish I knew!”

“I wish you did,” he answered. “You have said all you could. I wish I believed what you say. It would be more dignified than to be simply out of humor with oneself, and resentful.”

“Larry,” she said gently. “I believe you are something more.”

“No! no! Nothing more!” he exclaimed. “Nothing more, for heaven’s sake!” And he made a quick gesture, as if he was intolerant

of the thought, and would like to move it away. So they said no more on this subject, and began soon after to talk about Richard.

“What did you mean,” Arbuthnot asked, “by saying that Richard showed signs of his approaching doom? Isn’t he in good spirits?”

“It seems incredible,” she answered, “that Richard should not be in good spirits, but it has actually seemed to me lately that he was not. The Westoria lands appear to have worried him.”

“The Westoria lands,” he repeated, slowly.

“He has interested himself in them too much,” she said. “Things don’t go as easily as he imagined they would, and it annoys him. To-day——”

“What happened to-day?” Laurence asked, as she stopped.

“It was not very much,” she said; “but it was unlike him. He was a little angry.”

“With whom?”

“With me, I think. Lately I have thought I would like to go abroad, and I have spoken of it to him once or twice, and he has rather put it off; and to-day I wanted to speak of it again, and it seemed the wrong time, somehow, and he was a trifle irritable about it. He has not always been quite himself this winter, but he has never been irritable with me. That isn’t like him, you know.”

“No, it isn’t like him,” was Laurence’s comment.

Afterward, when he was going away, he asked her a question:

“Do you wish very much to go abroad?” he said.

“Yes,” she answered.

“You think the change would do you good?”

“Change often does one good,” she replied. “I should like to try it.”

“I should like to try it myself,” he said. “Go if you can, though no one will miss you more than I shall.”

And, having said it, he took his departure.

(To be continued.)

## IS THE JURY SYSTEM A FAILURE ?

AN elderly merchant from Eastern lands was making his first journey in the United States, in company with a New York banker, through one of the richest sections of our country. He admired our large cities, our mountains, our great lakes and rivers, and our forests, which were then in the full splendor of their autumnal colors. He spoke of his surprise at the marvelous energy with which this American race had conquered a wilderness and developed the resources of a continent. He asked all manner of questions about our commerce, our railways, our schools, and our politics. At last he spoke of our courts. He said that if in his own country the people could only have pure courts, where they could get justice surely and speedily, they would, he thought, soon enter on a new and prosperous existence. The American, in answer to the questions that were put to him, explained our judicial machinery, and especially the system of jury trials, under which, as he told his guest, the people themselves took part in the administration of justice, and causes were decided by the verdict of twelve ordinary citizens, under the supervision of a judge, from whom they received their instructions on the points of law arising in the case before them.

"And these twelve citizens," said the merchant, "how are they selected? They are chosen, I suppose, by a vote of the people. That is, I am told, the distinguishing feature of democracy."

"No," said the banker, "they are not chosen by a vote of the people."

"Then are they selected by the judge for their wisdom, or for the experience they have had in the hearing of causes?"

"No, they are not selected for their wisdom, or for their experience."

"Then, how is it decided who these twelve men are to be?"

"These twelve jurymen," said the American, "are chosen by lot. We place a large number of names in a box, draw out the names of twelve men at random, and these twelve men form the jury who hear the cause."

"That is most singular," said the merchant.

"In my own country, indeed, our games are many of them games of chance, as it is with all highly enlightened peoples. So it is, I know, with yourselves. You Americans, in play, use cards and dice. Some of your ambassadors at the royal courts of Europe have taught us much that we never knew about cards. But in my own land we do not use the processes of gambling in the daily working of our government. We do not choose our public servants by drawing lots or throwing dice. We make an attempt, in theory at least, to select our officials because they have skill and experience in public affairs. I do not mean that we often succeed in putting our theory in practice."

He paused for a moment.

"You surprise me greatly," he continued. "But when you have once chosen your jurymen, no doubt they soon get a large experience, and in time they must become very useful public servants."

"Why, no," said the American, "I cannot say that they do. We do not keep the same jurymen long in our judicial service. In fact we draw a new set of jurymen for each cause. The same man may by chance serve on a jury two or three times in the course of a year—hardly oftener than that."

"You are, indeed, a wonderful people! But do you choose all your public officers by lot?"

"It has been suggested that we should do so; but as yet, we use that method only for our juries."

"And with your other public servants—do you choose new men each day?"

"Oh, no! Our jurors are the only ones of our public servants whom we change as often as that. Our President, for instance, who is the Commander of our Army and of our Navy, and the head of our diplomatic service, who is, in short, the chief executive officer of the whole nation, we keep in office for four years."

The Oriental for some time seemed wrapped in deep thought, and, with a smile on his face, again began his questions.

"Tell me," he said, "the engineer on our

railway train,—is he, too, a new man? Is this the first time he has ever driven a locomotive?"

"By no means," said the American. "This engineer is a man of experience. As I happen to know, he has been in the employ of this railroad company for twenty-five years."

"I am heartily glad to know that. I feared it might be your custom to do with your engineers as you do with your jurymen, and take a new engineer on each train. But as a rule, how often do you discharge them and put new men in their places?"

"My dear friend," said the American, "you do not understand us. It is only in our government that we keep continually changing our servants. You could never carry on a railway on such a system as that. It takes eight or ten years for a man to learn how to manage a steam-engine. It would never do to put a locomotive in the hands of a man with no experience."

"So I should suppose. Otherwise you would soon have neither railway trains nor passengers. And these magnificent mills that I see on every side, they are operated, I imagine, by men who are trained for their work, and follow one calling all their lives, are they not?"

"Certainly: in mills you must have skilled labor. No mill-owner would trust his costly machinery to ignorant workmen. We manage our mills as we do our railroads."

"And in your mills you do not select your operatives or your superintendents by drawing lots?"

"Certainly not."

"It is then only in your government affairs that you use ignorant men for doing your work, and it is there alone that you choose your servants by lot?" He paused a few moments, and resumed: "Your people must have a wonderful genius for government, or, it may be, for getting on without any government. How long with you does it take a man to learn to make a shoe?"

"That I cannot tell you precisely; but I should suppose that a man of ordinary intelligence might learn how to make a tolerably good shoe in four or five years, if he began to learn the trade when he was young. If he waited till he were old, he would never become a really skillful workman. His hands and fingers would be stiff and awkward."

"Or to be an accountant, to keep the accounts of your bank, for instance,—how long would it take a man to fit himself for that?"

"My dear sir, the man who has the charge of the accounts of my bank has been in the employ of our house for forty-five years. He grew up with us from a boy. He is familiar

with all the details of our business through all its branches. He knows the whole history of each one of our transactions more thoroughly than I do myself. I could easily get another accountant as skillful as he is, but no other man has his knowledge of our affairs. That is what makes his value to me. And it has taken him forty-five years in our service to learn what he now knows. But you ask me how long it takes to become an accountant. I should say that in two or three years a man might gain skill enough to keep the books of an ordinary retail house, if he were intelligent, and, as we say, quick at figures."

"Allah be praised! But you are a wonderful people! In our wildest and most fanciful romances I have never read anything that equals what you now tell me. You say it takes a man five years to learn to make a good shoe, and two or three years to become an accountant. And at the head of your government affairs once in four years you place a man who has had no experience at his work, and in your courts to administer justice you have new men each day, and choose them by lot. You are indeed a most wonderful people. And is this what you call democracy?"

"It would seem that it must be," said the American. "I do not know that I have ever before tried to think what democracy really was. But this would seem to be one of its features as we practice it."

The aged Oriental kept silence for a time, and at last his thoughts found vent in the pious ejaculation: "Allah be praised! There is one God, and Mahomet is his prophet!" And that was, as is easily seen, the only strictly logical conclusion which he could reach from his premises.

This may sound like an attempt at burlesque; but it is not. However we may theorize on the matter, as a fact the distinctive features of our jury system are precisely these: that we take men to sit as judges in our courts who have neither training nor experience for their work; we take new men each day; and we select them by lot.

Can this be wise? It is a method which we use nowhere but in our public service. Throughout all other human affairs, if we wish work of any kind done well, we use men of skill and training. Everywhere but in our public service a man must learn his trade, as the phrase is, must learn how to do his one kind of work, whether it be hard or easy, whether it be ditching, or coal-mining, or building iron steam-ships. But when we come to the management of the state affairs of a great people, we seem to think that training is of no value. And in the administration of justice we go to the extreme length of taking

new men to decide each new cause, and choosing them by lot. Can it be that government work is the one kind of work in the world that men can do well without first learning how?

Thoughtful persons are beginning to have their doubts on this question, or, rather, they are beginning to end their doubts. It is true that, in times past, many able men have been of the opinion that the jury system, as a part of the working machinery for the administration of justice, was well fitted to its uses. But public opinion on that point is changing. The men who still have faith in the jury system are mostly theorists, men who do not know its real workings. The men who really see its workings know its faults. And, of all men, those who think worst of it are jurymen themselves. They are the men who best know what it is. I have often heard opinions as to the methods of juries given by men who have served in the jury-box, and never once a favorable one. Always they have said that they would never wish a cause of their own, if it were a just one, to be tried before a jury.

The whole question is a practical one. Men say that, theoretically, the jury system may not be perfect, but that "it works well." This is the whole point. I maintain that the jury system does not "work well," if words are to have their true meaning. When we say that a system works well, we mean, or we ought to mean, not that we have thus far been able to endure it, but that it is the best thing we can get for its purpose. Now our present jury system "works well" in the same way that a cart without springs works well. We can, indeed, use it to transport hay and cord-wood. It is even possible to make a journey with it, and perhaps bring our bones unbroken to the journey's end. A cart without springs is an improvement on a sledge without wheels. But how does it compare with this thing which we call a steam railway train?

The question is not one to be decided hastily, or from only one point of view. Many men, who are quite convinced that the jury is not a perfect tribunal for getting wise decrees, yet have a doubt whether we can devise anything better to take its place. Others who think that we may possibly frame something better than our jury system, looking at it merely as a part of the machinery for the administration of justice, yet have a belief that we must keep it as a bulwark of the people's liberties. Others think that the jury system has great value as a means to the political education of the people. An idea, too, is widely held that the jury is a political growth, that it is only one organ in a large

organism, and that an attempt to make any great change in the one organ will endanger the health or the existence of the whole organism. And, finally, many men who are well convinced that, on every ground, we ought to have some new machinery in the place of the jury, say that we can *do* nothing, that the people cannot be persuaded to make a change, even if a change be wise.

I propose then, by way of an individual contribution to the people's thought on one of the people's questions, to consider our jury system from these different points of view. And my attempt will be to show that we can find something which will better serve the people's needs than our present jury system, whether we view it merely as a part of the people's machinery for the administration of justice, as a safeguard of the people's liberties, as a means to the people's education, or as a stage in the growth of the people's government. And I shall also try to show that, if it be wise to make a change in our jury system, the change can be made.

The first point to be considered is whether we cannot devise something better than our jury system, viewing it merely as a part of the people's machinery for the administration of justice. And here we must consider, what are the ends to be accomplished by any possible system of legal tribunals; whether the jury system serves those ends well; and whether any other system will serve those ends better.

At the outset we must give up all idea of having any system which will make us sure in every case of getting the one right decree. We shall at times have wrong decrees, under any system. We have to use in the administration of justice imperfect human beings. We cannot get from them perfect results. Counsel will not always find out the whole truth of a case from hearing only one side of it, nor will courts always do so after hearing both sides. Justice will at times miscarry, as long as men are what they are, and until the bench and bar finally accomplish their glorious mission of regenerating human nature in its moral aspects.

Assuming then that any system of tribunals will be imperfect, the end to be accomplished by any system of courts is to make justice—so far as we can—sure, speedy, and cheap. To make justice sure is, of course, the first thing. But it is almost as important to make it cheap and speedy. The delays and the cost of litigation are now its greatest evils. Most men might nearly as well give up their rights as get them only after years of weary waiting. Especially is it the poor and weak who must always suffer most from these

delays of the law, which now often amount practically to a denial of justice.

How, then, does the jury system serve these purposes of getting justice surely, speedily, and cheaply? What are its good points, and its bad ones?

Two features in the jury system are, in my belief, thoroughly good, and should be had in every tribunal which is to give final decrees in cases involving more than very small amounts of property. And these two features are, that the jury is a tribunal made up of several members—and that the assent of every member is required to its verdict. As it seems to me, in no cause of any importance, should a final judgment be given by only one man. There should always be the working together of several minds. As a rule, one mind does not see all the points of a case, or wisely weigh them all, and different minds see different points. If then we should have a tribunal made up of several members who were men of ability and training, it would be as near to a certainty as we can get, that no points of real weight in a case would go unseen. And if the assent of each member were required to the judgment, it would be as near to a certainty as we can get, that every point seen in a case would be thoroughly considered. For the man whose voice must be had in order to reach a result, has in his hands a sure means of compelling a hearing. This requiring the assent of each member of a jury to the verdict has been, it is true, very often disapproved. I am convinced it is a thoroughly wise feature. In practice it has never worked any great inconvenience. Even with our present juries, made up, as they are, of men new to their work and to one another, there is almost never any great difficulty in their agreeing on a verdict. This is natural enough. Men of common sense, where it is necessary that they should come to an agreement, come to an agreement. And juries are generally made up of men who have common sense. They are able to see that, where individual views differ, individual views must yield; and they yield. It may be said that, although this is the case with inexperienced jurymen, it might not be so with old judges, who are stronger men, with firmer opinions. But here we have the results of actual experiment. And we find as a fact that judges after learning law do not lose their common sense, and that where it is necessary for them in the discharge of their duty to agree on a judgment, they agree on a judgment. An examination of the Reports of the present New York Court of Appeals shows that the decisions are unanimous in about ninety-five cases out of a

hundred. And the judges of that court have to agree on the hardest thing in the world for men to agree on,—mere opinions and processes of reasoning. If they had to agree only on a result, on a just judgment, I venture to think that they would not have a disagreement once in five hundred times, and that they would seldom have any difficulty in agreeing quickly. Men who know how to do their work, and are in the habit of working together, learn to work together with smoothness and speed. I venture the further opinion that it is only the requiring the assent of every jurymen to the verdict which has made the jury an endurable thing. Our jurymen now, especially in the large cities, are as a class much more intelligent men than the jurymen of fifty or a hundred years ago. But even with the more intelligent juries of this day we do get at times unjust verdicts. It is owing to this requirement of agreement, that we do not have them oftener than we do. Almost always on a jury there are at least two or three men of superior shrewdness and intelligence. These men usually control the result. They are enabled to do so because they have it in their power to prevent a wrong verdict by withholding their votes. A verdict which commands the assent of every one of twelve men will not often be very unjust.

So far the good points.

There are bad points. The jury is a body of men who have no knowledge of the law,—who follow other callings,—and who have practically no experience or training in hearing and deciding mere questions of fact. Moreover, in causes which are tried before a jury, no final judgment can be had without a jury's verdict.

The results which follow are most remarkable.

In the first place, it is this fact that a jury is a body of men who have no knowledge of the law, that compels us to use that most singular piece of judicial machinery, the double tribunal, of judge and jury, made up of one man who knows the law and twelve men who do not; but where the twelve men who do not know the law decide the cause, and the one man who does know it merely tells them what the law is. That is what we are driven to so long as we have juries. Causes must be decided on some fixed legal principles, and jurymen know nothing of them. The simple, natural course would seem to be to have a court made up of men who do know those principles. But we keep the jury, and place the jurymen under the guidance of a judge. Here, too, the natural course would seem to be to have this trained judge give the judgment. But the judgment or verdict is given by the untrained

jurymen. It will be said that the jury has only to apply the principles of law, which are stated to them by the judge. But it is this applying legal principles, as it is called, which tries the brains of the strongest men in the legal profession. That is especially the work to which untrained minds are not equal. This attempt to have one man decide a cause on another man's ideas of law,—to have twelve men think with another man's brains,—is not fitted to give the best results.

We come to another point. The fact that the jury is a temporary body, made up of men who have other callings, which they leave at a sacrifice, to which they must at once return, makes it impossible that intricate causes should have, either as to the facts or the law, the thorough consideration they need. It is not an infrequent thing for a trial to last a week, or even a month. Many witnesses will be examined, many papers read. To carry all the evidence of a long trial in the mind is a thing that few men can do, even with the training of a life-time. In a cause which has a large mass of conflicting testimony, it is an impossible thing, even for the most able and experienced judges, to give sound decisions on mere matters of fact, without having the exact record of the witnesses' words, copies of all the papers, and, above all things, *time* to read and think. But this body of men, with no training at all, as a rule, have no record of the evidence, no papers, must depend on their mere memory of what they have heard, and they come to their decision in one hurried conference of perhaps one or two hours; or if they take a longer time for their deliberations the result at times depends on a mere contest of physical endurance. At the same time, too, the judge, in making his charge upon the law, is placed under every possible disadvantage. Many difficult points are presented to him for his decision at the very end of a trial. He has little time for quiet thought, or for the examination of books. If he makes a slight misstatement as to any of the legal principles bearing on the merits of the cause, it will be ground for a new trial. And it is from a hurried oral statement that the jury is supposed to gain a sufficient knowledge of the legal principles involved in the cause, to master which the judge has taken the study of years. In short, both judge and jury are placed in circumstances which go far to make a careful examination of the law and facts of a case impossible, and to make error certain.

The fact, too, that the jury is made up of inexperienced men necessitates all the wearisome and needless contests over the admission of evidence. A tribunal of men who

were fitted for their work would hear, within reasonable limits, everything which could possibly throw any light on the case to be decided,\* and would wisely weigh all the evidence laid before it; but with a jury we know that testimony will not always be rightly weighed. We are compelled, therefore, to have the judge exclude all testimony which is not strictly relevant (as the phrase is) to the points to be decided, for fear that it may have an undue weight in the jury's minds. Can anything be more absurd? We say in so many words that a jury cannot be trusted rightly to weigh testimony, and yet we keep the jury for the one purpose of weighing testimony.

But the jury is not a tribunal well fitted to decide even mere questions of fact. It is often said that, for deciding the every-day differences of business men, we need the every-day common sense of business men. No doubt we need common sense. But every-day common sense is not enough. We must have trained common sense. This work of judging, of sifting large masses of conflicting testimony, of detecting falsehood, is a thing which cannot be well done by men picked from the community at random. It takes strong minds, and it takes experience in this special work of judging. The ablest and most experienced lawyer at the bar, before he can be a really useful judge, must have a new experience on the bench. It is often said, too, that to decide the causes of business men we must have the experience of business men. But is that true? A contract is a contract, whether it concerns flour or railway bonds. And for a man to decide justly the rights of the parties under a contract for the sale of flour or bonds, it is not necessary that he should be a flour-dealer or a bond-broker. What is needed in order to judge business causes is, not personal experience in any one branch of business, but a knowledge of the general methods of business men in all branches. In a few years on the bench, a judge gets a knowledge of the general methods of business men which no business man can possibly have. The thing especially needed in deciding causes is a knowledge of human nature as it shows itself in the witness-box. And that knowledge can be had only from a long experience in court-rooms.

But the most singular point of all is yet to be given. It is almost a certainty, that with tribunals thus constituted there will be errors to correct. In fact, in a trial of any length, with adroit counsel on either side, it is almost a wonder if there is not error. To correct these errors there must then be appeals. But since, under our law, the

final decision must be made by a jury, the appellate court gives no judgment on the merits of a cause. It only decides whether there was or was not error in one process, in the judge's rulings, either on points of law or on points of evidence. The result of the trial, the verdict, may have been right or may have been wrong. With that point the appellate court has nothing to do. Moreover, if it finds there has been error, it does not correct the judgment, but only orders another trial, to begin anew the series of blunders and appeals with not much more certainty of a right result than there was in the beginning. It is this possibility, or almost certainty, of appeals and new trials, and wearying delays, which causes half the litigation that burdens our courts, and which is the worst result of our jury system. It is a result which comes directly and necessarily from having men do work which they have never learned how to do.

The result, then, to which the argument thus far has brought us, is this: that there are two good features in the jury, its being a tribunal of several members, and the requiring the assent of every member to its verdict. And, on the other hand, our conclusion is that its other features, its being made up of men who have no knowledge of the law, and its being a temporary body of men having other callings, make it certain that we shall have many wrong judgments, with long delays and heavy expense to suitors. In short, the jury at this day fails to accomplish the ends which should be accomplished by a well-devised judicial system.

But what can we have that is better?

Suppose that we were to try this very simple plan. Suppose we were to keep in our judicial system the features which had been found by experience to work well, and were to do away with those features which have been found to work ill. Suppose that, in the place of this double tribunal,—made up partly of untrained men who give their time to other affairs, with whom deliberate examination of a case is impossible,—we were to have a single tribunal, of trained men, who should give their whole time to their work, who should give to each cause the time it really might need. Suppose, in short, we were to put our appellate court of trained judges at the beginning of the litigation instead of at the end of it; were to have them hear the whole of the cause on its merits, instead of one or two points of it on a technicality; were to have them give a judgment themselves, instead of simply saying whether some one else had made a blunder, and that we were then to abolish appeals?

This may sound somewhat sweeping. But

let us recall some steps of the argument, and see if there is any way of escaping the position in which we now find ourselves. We know that this jury is a body of men having no training for their work. We know that its constitution makes thorough deliberation an impossible thing. We know that it drives us to the double tribunal. We know that errors must certainly result. And we know that the existence of these errors must and does cause the costly and tedious delays of the law. Now, can any man point out any other cause for all these errors and delays, except this one fact, that we use a tribunal of untrained men for doing work which requires men of training? And what other remedy then is possible except to use trained men in their place? It may, too, at first seem that there would be danger in abolishing appeals. But what is the end that under our present system we try to gain by appeals? Nothing but the correction of error. And what is the means that we use for this correction of error? Nothing but the having in the final appellate courts seven learned and experienced lawyers to hear the cause. If then we have our seven learned and experienced lawyers hear the cause in the beginning instead of at the end, what are we to lose, except delay?

But let us examine with somewhat more care the probable results of the modifications here proposed.

In the first place we should, with these modifications, have as great a certainty of just decrees as we can get under any system. So long as we use human beings for the administration of justice we cannot possibly devise a better tribunal than one made up of a reasonable number of able and experienced judges. Suppose an important cause were to be tried, and that the hearing were had before a court of seven experienced judges, like our present New York Court of Appeals. Suppose that they heard all the witnesses, admitted such testimony as they saw fit, giving—as they undoubtedly would—all reasonable latitude on this point, hearing everything which could throw any real light on the matters in dispute, and taking for their decision, not one hour or one day, but precisely such time as they might need. Would not a decree which should be assented to by every member of such a court be very certain of being just? Would not the judgment of such a court, on the whole case, be better than its own judgment on half the case? And would not the careful judgment of seven trained men be better than the hasty judgment of twelve untrained men? This would seem to be somewhat in the nature of an old-fashioned sum in arithmetic, in Rule of Three.

At the same time similar modifications should be made in that branch of our procedure which concerns what we call equity practice, where causes are now heard in the first instance before a single judge. Here, too, instead of having the cause first heard before one man, taking the chance of his errors, and then appealing to higher courts to set those errors right, we should have the cause heard in the beginning, once for all, on the merits, before a court of several judges, should get our best possible result at the outset, and avoid all this needless expense and delay. This would give us, too, a simple method of fusing common law and equity practice, which lawyers generally agree is a very desirable thing, but which can never be thoroughly accomplished so long as we retain the system of jury trials for what we call common law actions.

But what would be done, it may be asked, if the members of such a court could not agree? To this the answer is, we would do as we do now when a jury does not agree,—have another trial. But this point has, it seems to me, been already fairly met. Experience shows that there would very seldom be disagreements. It is sometimes supposed that the duty of a jurymen or a judge requires a man to refuse his assent to a verdict or a judgment which he does not think a correct one. But this is not so. No doubt a jurymen or a judge is bound to do what he can in reason to bring about a result which he thinks right. But he is bound to help a result, not to hinder one. It might be well to provide that in the event of a second trial a judgment could be rendered by fewer members. I do not believe, however, that such a provision would be needed once in five hundred cases. But it could do no harm.

It may be thought that such a change would necessitate a large increase in the number of our judges, and would therefore greatly increase the public expenses. If it did increase the direct outlay for judges' salaries, there would be in the end a great saving to the people. The item of judges' salaries is a small fraction of what the people now have to pay for the administration of justice. The delays of our courts are what now make the main tax on the people. Here, as elsewhere, it is no true economy to work with poor tools or bad materials. I doubt, however, if the force of judges needed would be much, if at all, increased by the changes here proposed. The work now done by the judges of our courts consists very largely in the hearing of appeals. As the practice now is in the State of New York, a case which goes but once in the regular course through the dif-

ferent courts to the highest appellate court, is heard in one form or another before eleven judges. It is not an infrequent thing for a cause to go through all the courts twice, in which case it is heard by twenty-two judges. This appellate work is the most laborious work of all, as it involves the writing of many opinions. Moreover, as I believe, half the cases which now get into the courts would never be brought there, if they were sure of being quickly heard before a court of able judges who would give at once a final judgment. It is the hope of delay that makes half our lawsuits.

The plan here given is to have no appeals, in their present form. But though we should do away with appeals, it would be necessary to have graded courts,—courts arranged for the trial of causes according to the amounts of property involved; perhaps, too, according to the different classes of matters involved. It might be wise, too, that causes should be sent by the lower courts to the higher ones for a hearing, when some new and important principles came up for decision. There would, too, in the minds of some men, be the fear which is, no doubt, still widely spread among us, of some danger at the hands of permanent officials of any kind. But this fear, I believe, is now fast disappearing. When our judges were independent of everything save the consequences of their own misconduct, before judges became politicians, while such a thing as a corrupt order or decree from a judge on the bench was a thing almost undreamed of, could a better tribunal possibly have been found than one made up of five or seven judges? Could a cause be in safer hands than in those of seven men like Kent, and Shaw, and Story? But take our judges as they now are, and I believe the general opinion of both lawyers and laymen would be overwhelming in favor of having causes heard before a court of judges, rather than before a court of laymen. The remedy here is not to take causes out of the hands of judges, but to take judges out of politics.

Any attempt to suggest a radical change in government methods is now generally received with great distrust, and almost with contempt. It is called theorizing. But everywhere else men try to make improvements,—and they make them. Moreover, they try to make those improvements by following principles, of some kind, after a study of faults and a search for remedies. Why should we not do the same in our government affairs? Is it there alone that we must use the machinery of five hundred years ago?

This whole system of trial by jury never was anything but a clumsy make-shift. In its

origin, the jury was not a court of justice for hearing causes, but only a feudal court of the lord's vassals. These vassals first became something in the nature of a judicial body merely for the purpose of deciding disputes as to landed estates or feuds; and in deciding these disputes they served mainly as witnesses to facts within their knowledge, and not as judges to hear causes on evidence. This court of vassals was, in time, converted into something like a court of justice, but merely for lack of any better machinery. No doubt the jury system was an advance on the methods it superseded. Trial by jury, as a method of ascertaining the truth, is something better than trial by battle. It answered very well for the simple transactions of a rude race just emerging from the fighting era of existence. But how does it serve the needs of a great working people in this nineteenth century? This system of having lawsuits heard by men who know nothing of law, this mixing of one lawyer with twelve laymen and calling them a court, is about as sensible as to try to drive a wild elephant and a thorough-bred in double harness. The combination is not a useful one. Need it be said that this marvelous monstrosity is the morganatic device of that grand old blundering, synthetic English people, which, in affairs of state, always insists on adapting old machinery to new uses, which tries to convert an antique feudal tin-pot into the cylinder of a modern legal locomotive, and which produces as its masterpiece in political machinery that wondrous thing called parliamentary government, where a minister is put in the War Office because some other men have been outvoted in Parliament, where he gives his time to general legislation instead of to army affairs, where he resigns from the War Office because he has blundered in the legislature on some measure concerning the Irish Church, or Irish landlords, but keeps his seat in the legislature, where he has made his blunders?

So far we have considered the jury as a part of the machinery for the administration of justice. We have, then, to see how necessary it is as a safeguard to the people's liberties.

In England, where the jury system grew, under the rule of hereditary kings, there was no doubt, in times gone by, great danger to the rights of the individual subject from kingly tyranny. The jury system did there fill a great need; it was the bulwark of the people's liberties. But have we, in this country and at this time, the same dangers, or, indeed, any dangers against which the jury system is the only, or the true, protection?

We have no hereditary king. With us the danger is, not to the rights of the individ-

ual from a king, but to the rights of the people from individuals. The fact is that the jury in our criminal procedure,—and in truth nearly our whole criminal procedure,—is especially adapted for the protection of criminals. It is society which needs protection for its liberties. And that protection can be had only by making in our criminal procedure the changes here already urged for our civil procedure,—by having a machinery for the speedy trial of all criminal charges before a fit tribunal, and by providing some means for getting a judgment against the criminal before the crime is forgotten. The only dangers there are with us to the rights of individuals come from the existence at times of popular passions or prejudices, which are almost always honest, though unreasoning. Against these passions and prejudices, the uniform experience of the community show that the only sure safeguard is in able and upright judges. How could it be otherwise? A judge is led by his whole training, by all his habits of life and thought, to take calm and deliberate views of the questions which are brought before him. Juries will at times work injustice through mere prejudice and excitement. The inclination of a judge is always to save the law and the individual from the passions of the hour. The old maxim, that it is better for fifty guilty men to escape than for one innocent man to suffer, is a judge's maxim. The law that citizens give to citizens, when they are not restrained by the authority of courts, is lynch law.

The argument thus far, if sound, brings us to the conclusion that the modifications in our judicial system here proposed—the having our courts composed of trained judges—would be a change for the better, so far as it concerns the administration of justice and the security of the people's liberties. But a widespread idea exists that the jury system has great value as a means to the political education of the people. My belief is that in this respect, too, we should be the gainers by the changes here proposed.

What is the real value of the jury system as a means to the people's political education? In its mere quantity the experience which citizens gain from their jury service is almost nothing. A man serves on a jury, at most, in the trial of three or four causes in the course of a year. This is a liberal allowance. Even supposing then that the trial of each one of these causes involved weighty principles of constitutional law, matters of the deepest interest to the citizen, how much could be learned from an experience of that extent? The men who follow the profession of the law for a long lifetime, at the end of their labors only

begin to learn the depth of their own ignorance. Take the most intelligent men we can find in the whole community, put them in the jury-box during the trial of half a dozen of the most important causes that ever come before a court, and how much can they learn, during those trials, of constitutional law, of the machinery of government, or of anything else?

But, as a matter of fact, the large majority of causes that come before a jury have not the most remote connection with constitutional law, with the science of government, or with anything that can rightly interest any living person other than the parties to the suit. The real experience of the jurymen is something like this: A jury has before it a suit on a promissory note against a man who has indorsed it. They hear the testimony and are told by the judge that it is for them to consider the evidence, and pass upon the facts; and if they find that notice of non-payment of the note was given to the defendant in a particular manner and at a particular time, they must find a verdict for the plaintiff, and otherwise for the defendant. Or they have before them a suit to recover a quantity of merchandise of which, as the plaintiff claims, the defendant got possession by fraud. The jury hear the testimony, and are instructed by the court that if on all the evidence they believe that the defendant made certain false and fraudulent misrepresentations, they must find a verdict for the plaintiff,—otherwise they must find for the defendant.

Can it be seriously urged that such experiences as these (and these are fair examples of the proceedings on ordinary jury trials) can have any substantial value for the purposes of political education? I venture to doubt whether the jury-box is very serviceable as a school of constitutional jurisprudence, or whether the jurymen by his service of two or three days in each year, gains any real knowledge as to the machinery or workings of a free government.

This idea that our jury system is a great educator for the people sprang up in the brain of Alexis de Tocqueville. Very probably that eminent Frenchman, when he was on this Western continent, was not more than ten times in a court-room; possibly he never heard the whole of one jury trial from its beginning to its end. It is easy to fancy his experience. Some learned and leisurely scholar no doubt took him to a court-room, where he probably found in progress a trial over the price of a cow, or some other equally exalted matter. De Tocqueville had heard that questions of constitutional law did at times come before our courts for decision. And he knew

that juries sat as part of our courts. We can fancy him exclaiming:

"Behold, at last my dream! I am thrilled with emotion at this sublime spectacle of a free people governing itself! The humblest citizen here feels himself to be part of the great State. In his own person he makes and expounds the laws, and under the guidance of learned judges studies the grand principles of constitutional jurisprudence. The sovereign people itself sits on the throne of justice! *Ah! c'est ravissant!*"

This might be thought an exaggeration. Here are De Tocqueville's printed words from his "*Democracy in America*." Speaking of the jury system, he says:

"It may be regarded as a gratuitous public school, ever open, in which every juror learns his rights, enters into *daily communication with the most learned and enlightened members of the upper classes*, and becomes *practically acquainted with the laws*, which are brought within the reach of his capacity by the efforts of the bar, the advice of the judge, and even by the passions of the parties."

Could anything be further from the fact? To imagine that a man can become "practically acquainted with the laws" from a few days' service as a jurymen is really humorous. As well might one hope to learn something of the science of medicine from carrying a few physicians' prescriptions to the druggist. Or, perhaps, we might at once convert the American people into accomplished surgeons by having them visit the hospitals two or three times a year and witness an amputation.

No doubt it is a wise thing for every citizen to learn as much as he can of the working of every part of our government system. Let him read and observe, on all subjects, as far as his opportunities will allow him. If he can take the needed time from his ordinary occupations, by all means let him make a personal inspection of the methods of our courts. Let him listen attentively to the arguments of distinguished counsel, and the utterances of learned judges. But shall he be allowed to learn law by deciding the causes of litigants? That is too costly, as a scheme of popular education.

But suppose, on the other hand, that every man who refused to perform his legal obligations could be brought before a court where it was certain that justice was not only sure but speedy, could any mere political machinery be devised, which could have a more healthful effect upon the people's moral tone?

But even if the points thus far argued be conceded, it may be said that the jury system is a growth,—that institutions must grow,—that such sweeping changes do not follow nature's laws, and are full of danger. How much truth is there in that?

It is for the very reason that human institutions grow, and that they grow by nature's ordinary processes, by the survival of the fittest, that it is certain we must and shall have some new and better judicial machinery in the place of our jury system. The whole doctrine of survival of the fittest rests on the fact that old organisms cease to be fit, and new organisms come into being which are fitter. The conditions of existence change. There was a time when this jury system was tolerably well fitted to the needs of the people. But that time has gone by. The jury system has had its day. When we say institutions grow, do we mean that we are to let them grow wild, or are we to guide their growth? The method of this American people is to make changes in their public institutions, when changes are needed, on principles; it may be on mistaken ones, but still on principles. We made these State and National constitutions, new things in political science, because they were needed. And no one of the men of a hundred years ago imagined that these constitutions would serve the needs of the American people for all coming time. We find now that this jury system is not equal to our needs, and we must change it. The question is, what shall we have in its place? We know that the growth which has been going on for ages is not now to cease, but will still go on for ages to come. And what is the next growth to be? Shall it be a wild natural fruit, or shall it have the care of man, to give it a rich, healthy development?

But can the people be persuaded to make this change? That is the question which comes after all the others. And the answer is, they can be persuaded to make a change so soon as they find the right change to make. What is the right change is the point we have to ascertain and decide by careful discussion. Every step that the American people has thus far taken in the development of popular government has been a step taken because the people thought it wise. And the American people are not afraid of anything because it is new. On the contrary, they are, if anything, too much given to new theories and sweeping constitutional changes. And the changes that have been thus far made have been changes, in the main, for the better. Everywhere else in the world we see the cause of civilization advancing. Are we here to reverse all the processes of nature, and are we here to begin losing ground? There is no doubt that elsewhere than in

their general affairs the people act on their views of their own interests. Will they do the reverse in their governmental affairs? What their true interests are, they may not yet know; but in good time they will learn. Meantime, to say that things cannot be done will not greatly help the doing. Of that kind of assistance to the people's progress we have had quite enough.

But, last of all, it may be said that such a scheme for having all causes, civil and criminal, decided by permanent judges, without juries of citizens, would not be democratic. But what does this mean? As has already been repeated, the only change here suggested is to put men of experience in the place of men without experience. If it be undemocratic to have our work done by skilled servants, who give their whole time to our affairs, then this proposed system is undemocratic. But let us not mistake the meaning of words. True democracy consists in having the people control the machinery of government, not in having them make a vain attempt to operate it with their own hands. The whole point lies here. This work of administering justice must be done by individuals, selected in some way from the community at large. The only question we have to decide is,—How shall those individuals be selected? Shall we take new men every day who cannot by possibility gain skill and experience, or shall we use trained workmen?

We must change our methods. We must learn that government work in all its branches demands men of training. The old system of turn and turn about no longer answers the needs of the age. One hundred years ago we were clearing a wilderness. The citizen of that day was compelled by the necessities of his position to follow all callings. He had to be by turns a farmer, a carpenter, a blacksmith, a soldier, and a judge. And at the end of the year, when the snow and ice of winter somewhat checked his ordinary activities, and he shared with his ursine neighbors the torpor of the season, he gave his vacant hours to the making of his own laws. That was, in a measure, his opera and theater.

That scheme of life was very well for its day. But its day is gone. In this nineteenth century, in this land of railways, telegraphs, and printing-presses, the work of making, expounding, and executing, the laws of a great nation, must be put in the hands of men who are trained for their work and give their lives to it. We have had enough of the rotatory, or annular, system—in government.

*Albert Stickney.*

## ENGLAND.

ENGLAND has played a part in modern history altogether out of proportion to its size. The whole of Great Britain, including Ireland, has only eleven thousand more square miles than Italy; and England and Wales alone are not half so large as Italy. England alone is about the size of North Carolina. It is, as Franklin, in 1763, wrote to Mary Stevenson in London, "that petty island which, compared to America, is but a stepping-stone in a brook, scarce enough of it above water to keep one's shoes dry."

A considerable portion of it is under water, or water-soaked a good part of the year, and I suppose it has more acres for breeding frogs than any other northern land, except Holland. Old Harrison says that the North Britons, when overcome by hunger, used to creep into the marshes till the water was up to their chins, and there remain a long time, "onlie to qualifie the heats of their stomachs by violence, which otherwise would have wrought and beene readie to oppresse them for hunger and want of sustinance." It lies so far north—the latitude of Labrador—that the winters are long, the climate is inhospitable, and would be severely cold, if the Gulf Stream did not make it always damp, and curtain it with clouds; in some parts the soil is heavy with water, in others it is only a thin stratum above the chalk; in fact, agricultural production could scarcely be said to exist there until fortunes made in India and in other foreign adventure enabled the owners of the land to pile it knee-deep with fertilizers from Peru and elsewhere. Thanks to accumulated wealth and the Gulf Stream, its turf is green and soft; figs, which will not mature with us north of the capes of Virginia, ripen in sheltered nooks in Oxford, and the large and unfrequent strawberry sometimes appears upon the dinner-table in such profusion that the guests can indulge in one apiece.

Yet this small, originally infertile island has been for two centuries, and is to-day, the most vital influence on the globe. Cast your eye over the world upon her possessions, insular and continental, into any one of which, almost, England might be dropped, with slight disturbance, as you would transfer a hanging garden. For any parallel to her power and possessions you must go back to ancient Rome. Egypt under Thotmes and Seti overran the then known world, and took tribute of it; but it was a temporary wave of conquest

and not an assimilation. Rome sent her laws and her roads to the ends of the earth, and made an empire of it; but it was an empire of barbarians largely, of dynasties rather than of peoples. The dynasties fought, the dynasties submitted, and the dynasties paid the tribute. The modern "people" did not exist. One battle decided the fate of half the world,—it might be lost or won for a woman's eyes; the flight of a chieftain might settle the fate of a province; a campaign might determine the allegiance of half Asia. There was but one compact, disciplined, law-ordered nation, and that had its seat on the Tiber.

Under what different circumstances did England win her position! Before she came to the front, Venice controlled, and almost monopolized, the trade of the Orient. When she entered upon her career, Spain was almost omnipotent in Europe, and was in possession of more than half the western world; and besides Spain, England had, wherever she went, to contend for a foothold with Portugal, skilled in trade and adventure, and with Holland, rich, and powerful on the sea. That is to say, she met everywhere civilizations old and technically her superior. Of the ruling powers, she was the least in arts and arms. If you will take time to fill out this picture, you will have some conception of the marvelous achievements of England, say since the abdication of the Emperor Charles V.

This little island is to-day the center of the wealth, of the solid civilization, of the world. I will not say of art, of music, of the lighter social graces that make life agreeable; but I will say of the moral forces that make progress possible and worth while. Of this island the center is London; of London the heart is "the city," and in the city you can put your finger on one spot where the pulse of the world is distinctly felt to beat. The Moslem regards the Kaaba at Mecca as the center of the universe; but that is only a theological phrase. The center of the world is the Bank of England in Leadenhall street. There is not an occurrence, not a conquest or a defeat, a revolution, a panic, a famine, an abundance, not a change in value of money or material, no depression or stoppage in trade, no recovery, no political and scarcely any great religious movement—say the civil deposition of the Pope, or the Wahhabec revival in Arabia and India—that does not report itself instantly at this sensitive spot.

Other capitals feel a local influence; this feels *all* the local influences. Put your ear at the door of the Bank, or the Stock Exchange near by, and you hear the roar of the world.

But this is not all, nor the most striking thing, nor the greatest contrast to the empires of Rome and of Spain. The civilization that has gone forth from England is a self-sustaining one, vital to grow where it is planted, in vast communities, in an order that does not depend as that of the Roman world did upon edicts and legions from the capital. And it must be remembered that if the land empire of England is not so vast as that of Rome, England has for two centuries been mistress of the seas, with all the consequences of that opportunity,—consequences to trade beyond computation. And we must add to all this that an intellectual and moral power has been put forth from England clear round the globe, and felt beyond the limits of the English tongue.

How is it that England has attained this supremacy,—a supremacy disputed on land and on sea by France in vain, but now threatened by an equipped and disciplined Germany, by an unformed Colossus,—a Slav and Tartar conglomerate,—and perhaps by one of her own children, the United States? I will mention some of the things that have determined England's extraordinary career; and they will help us to consider her prospects. I name:

I. *The Race.* It is a mixed race, but with certain dominant qualities, which we call, loosely, Teutonic; certainly the most aggressive, tough, and vigorous people the world has seen. It does not shrink from any climate, from any exposure, from any geographic condition; yet its choice of migration and of residence has mainly been on the grass belt of the globe, where soil and moisture produce good turf, where a changing and unequal climate, with extremes of heat and cold, calls out the physical resources, stimulates invention, and requires an aggressive and defensive attitude of mind and body. The early history of this people is marked by two things:

(1) Town and village organizations, nurseries of law, order, and self-dependence, *nuclei* of power, capable of indefinite expansion, leading directly to a free and a strong government, the breeders of civil liberty.

(2) Individualism in religion, protestantism in its widest sense: I mean by this, cultivation of the individual conscience as against authority. This trait was as marked in this sturdy people in Catholic England as it is in Protestant England. It is in the blood. England

never did submit to Rome, not even as France did, though the Gallic church held out well. Take the struggle of Henry II. and the hierarchy. Read the fight with prerogative all along. The English church never could submit. It is a shallow reading of history to attribute the final break with Rome to the unbridled passion of Henry VIII.; that was an occasion only: if it had not been that, it would have been something else.

Here we have the two necessary traits in the character of a great people: the love and the habit of civil liberty; and religious conviction and independence. Allied to these is another trait,—truthfulness. To speak the truth in word and action, to the verge of bluntness and offense—and with more relish sometimes, because it is individually obnoxious and unlovely—is an English trait, clearly to be traced in the character of this people, notwithstanding the equivocations of Elizabethan diplomacy, the proverbial lying of English shopkeepers, and the fraudulent adulteration of English manufactures. Not to lie is perhaps as much a matter of insular pride as of morals; to lie is unbecoming an Englishman. When Captain Burnaby was on his way to Khiva, he would tolerate no oriental exaggeration of his army rank, although a higher title would have smoothed his way and added to his consideration. An English official, who was a captive at Bokhara (or Khiva), was offered his life by the Khan if he would abjure the Christian faith and say he was a Moslem; but he preferred death rather than the advantage of a temporary equivocation. I do not suppose that he was a specially pious man at home, or that he was a martyr to religious principle, but for the moment Christianity stood for England and English honor and civilization. I can believe that a rough English sailor, who had not used a sacred name since he said his prayer at his mother's knees except in vain, accepted death under like circumstances, rather than say he was not a Christian.

The next determining cause in England's career is

II. *The insular position.* Poor as the island was, this was the opportunity. See what came of it:

(1) Maritime opportunity. The irregular coast-lines, the bays, and harbors, the near islands and mainlands invited to the sea. The nation became, *per force*, sailors,—as the ancient Greeks were and the modern Greeks are: adventurers, discoverers, hardy, ambitious, seeking food from the sea, and wealth from every side.

(2) Their position protected them. What they got they could keep; wealth could ac-

cumulate. Invasion was difficult, and practically impossible to their neighbors. And yet they were in the bustling world, close to the continent, commanding the most important of the navigable seas. The wealth of Holland was on the one hand, the wealth of France on the other. They held the keys.

(3) Their insular position and their free institutions invited refugees from all the continent, artisans and skilled laborers of all kinds. Hence, the beginning of their great industries, which made England rich, in proportion as her authority and chance of trade expanded over distant islands and continents. But this would not have been possible without the third advantage which I shall mention, and that is:

III. *Coal.* England's power and wealth rested upon her coal beds. In this bounty nature was more liberal to the tight little island than to any other spot in Western Europe, and England took early advantage of it. To be sure, her coal field is small compared with that of the United States,—an area of only 11,900 square miles to our 192,000. But Germany has only 1,770; Belgium, 510; France, 2,086, and Russia only in her expansion of territory leads Europe in this respect, and has now 30,000 square miles of coal beds. But see the use England makes of this material: in 1877, she took out of the ground 134,179,968 tons. The United States the same year took out 50,000,000 tons; Germany, 48,000,000; France, 16,000,000; Belgium, 14,000,000. This tells the story of the heavy industries.

We have considered as elements of national greatness the race itself, the favorable position, and the material to work with. I need not enlarge upon the might and the possessions of England, nor the general beneficence of her occupation wherever she has established fort, factory, or colony. With her flag go much injustice, domineering, and cruelty, but on the whole the best elements of civilization.

The intellectual domination of England has been as striking as the physical. It is stamped upon all her colonies; it has by no means disappeared in the United States. For more than fifty years after our independence, we imported our intellectual food,—with the exception of politics, and theology in certain forms,—and largely our ethical guidance from England. We read English books, or imitations of the English way of looking at things; we even accepted the English caricatures of our own life as genuine,—notably in the case of the so-called typical Yankee. It is only recently that our writers have begun to describe our own life as it is,

and that readers begin to feel that our society may be as interesting in print as that English society which they have been all their lives accustomed to read about. The reading-books of children in schools were filled with English essays, stories, English views of life; it was the English heroines over whose woes the girls wept; it was of the English heroes that the boys declaimed. I do not know how much the imagination has to do in shaping the national character, but for half a century English writers, by poems and novels, controlled the imagination of this country. The principal reading then as now—and perhaps more then than now—was fiction, and nearly all of this England supplied. We took in with it, it will be noticed, not only the romance and gilding of chivalry and legitimacy, such as Scott gives us, but constant instruction in a society of ranks and degrees, orders of nobility and commonalty, a fixed social status, a well ordered, and often attractive, permanent social inequality, a state of life and relations based upon lingering feudal conditions and prejudices. The background of all English fiction is monarchical; however liberal it may be, it must be projected upon the existing order of things. We have not been examining these foreign social conditions with that simple curiosity which leads us to look into the social life of Russia, as it is depicted in Russian novels; we have on the contrary absorbed them generation after generation as part of our intellectual development, so that the novels and the other English literature must have had a vast influence in molding our mental character, in shaping our thinking upon the political as well as the social constitution of states.

For a long time the only American counteraction, almost the only, to this English influence was the newspaper, which has always kept alive and diffused a distinctly American spirit—not always lovely or modest, but national. The establishment of periodicals which could afford to pay for fiction written about our society, and from the American point of view, has had a great effect in our literary emancipation. The wise men whom we elect to make our laws—and who represent us intellectually and morally a good deal better than we sometimes like to admit—have always gone upon the theory with regard to the reading for the American people, that the chief requisite of it was cheapness, with no regard to its character so far as it is a shaper of notions about government and social life. What educating influence English fiction was having upon American life, they have not inquired, so

long as it was furnished cheap, and its authors were cheated out of any copyright on it.

At the North, thanks to a free press and periodicals, to a dozen reform agitations, and to the intellectual stir generally accompanying industries and commerce, we have been developing an immense intellectual activity, a portion of which has found expression in fiction, in poetry, in essays, that are instinct with American life and aspiration; so that now for over thirty years, in the field of literature, we have had a vigorous offset to the English intellectual domination of which I spoke. How far this has in the past molded American thought and sentiment, in what degree it should be held responsible for the infidelity in regard to our "American experiment," I will not undertake to say. The South furnishes a very interesting illustration in this connection. When the civil war broke down the barriers of intellectual non-intercourse behind which the South had ensconced itself, it was found to be in a colonial condition. Its libraries were English libraries, mostly composed of old English literature. Its literary growth stopped with the reign of George III. Its latest news was the "Spectator" and the "Tatler." The social order it coveted was that of monarchical England, undisturbed by the fiery philippics of Byron or Shelley, or the radicalism of a manufacturing age. Its chivalry was an imitation of the antiquated age of lords and ladies, and tournaments, and buckram courtesies, when men were as touchy to fight, at the lift of an eye-lid or the drop of a glove, as Brian du Bois Guilbert, and as ready for a drinking bout as Christopher North. The intellectual stir of the North, with its disorganizing radicalism, was rigorously excluded, and with it all the new life pouring out of its presses. The South was tied to a republic, but it was not republican, either in its politics or its social order. It was, in its mental constitution, in its prejudices, in its tastes, exactly what you would expect a people to be, excluded from the circulation of free ideas by its system of slavery, and fed on the English literature of a century ago. I dare say that a majority of its reading public, at any time, would have preferred a monarchical system and a hierarchy of rank.

To return to England. I have said that English domination usually carries the best elements of civilization. Yet it must be owned that England has pursued her magnificent career in a policy often insolent and brutal, and generally selfish. Scarcely any considerations have stood in the way of her trade and profit. I will not dwell upon her opium culture in India, which is a proximate cause of

famine in district after district, nor upon her forcing the drug upon China,—a policy disgraceful to a Christian queen and people; we have only just got rid of slavery, sustained so long by Biblical and official sanction, and may not yet set up as critics. But I will refer to a case with which all are familiar—England's treatment of her American colonies. In 1760 and onward, when Franklin, the agent of the colonies of Pennsylvania and Massachusetts, was cooling his heels in lords' waiting-rooms in London, America was treated exactly as Ireland was,—that is, discriminated against in every way; not allowed to manufacture; not permitted to trade with other nations, except under the most vexatious restrictions; and the effort was continued to make her a mere agricultural producer and a dependant. All that England cared for us was that we should be a market for her manufactures. This same selfishness has been the key-note of her policy down to the present day, except as the force of circumstances have modified it. Steadily pursued, it has contributed largely to make England the monetary and industrial master of the world.

With this outline, I pass to her present condition and outlook.

The dictatorial and selfish policy has been forced to give way somewhat with regard to the colonies. The spirit of the age and the strength of the colonies forbid its exercise; they cannot be held by the old policy. Australia boldly adopts a protective tariff, and her parliament is only nominally controlled by the crown. Canada exacts duties on English goods, and England cannot help herself. Even with these concessions, can England keep her great colonies? They are still loyal in word. They still affect English manners and English speech, and draw their intellectual supplies from England. On the prospect of a war with Russia, they nearly all offered volunteers. But everybody knows that allegiance is on the condition of local autonomy. If united Canada asks to go, she will go. So with Australia. It may be safely predicted that England will never fight again to hold the sovereignty of her New-World possessions against their present occupants. And, in the judgment of many good observers, a dissolution of the empire, so far as the western colonies are concerned, is inevitable, unless Great Britain, adopting the plan urged by Franklin, becomes an imperial federation, with parliaments distinct and independent, the crown the only bond of union,—the crown, and not the English parliament, being the titular and actual sovereign. Sovereign power in the parliament over America, Franklin never would admit. His idea was that all

the inhabitants of the empire must be citizens, not some of them subjects ruled by the home citizens.

The two great political parties of England are really formed on lines constructed after the passage of the Reform Bill of 1832. The Tories had been long in power. They had made many changes and popular concessions, but they resisted parliamentary reform. The great Whig lords, who had tried to govern England without the people and in opposition to the crown in the days of George III., had learned to seek popular support. The Reform Bill, which was ultimately forced through by popular pressure and threat of civil war, abolished the rotten boroughs, gave representation to the large manufacturing towns and increased representation to the counties, and the suffrage to all men who paid ten pounds a year rent in boroughs, or in the counties owned land worth ten pounds a year or paid fifty pounds rent. The immediate result of this was to put power into the hands of the middle classes, and to give the lower classes high hopes, so that, in 1839, the Chartist movement began, one demand of which was universal suffrage. The old party names of Whig and Tory had been dropped, and the two parties had assumed their present appellations of Conservatives and Liberals. Both parties had, however, learned that there was no rest for any ruling party except a popular basis, and the Conservative party had the good sense to strengthen itself in 1867 by carrying through Mr. Disraeli's bill, which gave the franchise in boroughs to all householders paying rates, and in counties to all occupiers of property rated at fifteen pounds a year. This broadening of the suffrage places the power irrevocably in the hands of the people, against whose judgment neither crown nor ministry can venture on any important step.

In general terms it may be said that of these two great parties the Conservative wishes to preserve existing institutions, and latterly has leaned to the prerogatives of the crown, and that the Liberal is inclined to progress and reform, and to respond to changes demanded by the people. Both parties, however, like parties elsewhere, propose and oppose measures and movements, and accept or reject policies, simply to get office or keep office. The Conservative party of late years, principally because it has the simple task of holding back, has been better able to define its lines and preserve a compact organization. The Liberals, with a multitude of reformatory projects, have, of course, a less homogeneous organization, and for some years have been without well-defined issues. The conservative

aristocracy seemed to form a secure alliance with the farmers and the great agricultural interests, and at the same time to have a strong hold upon the lower classes. In what his opponents called his "policy of adventure," Lord Beaconsfield had the support of the lower populace. The Liberal party is an incongruous host. On one wing are the Whig lords and great land-owners, who cannot be expected to take kindly to a land reform that would reform them out of territorial power; and on the other wing are the Radicals, who would abolish the present land system and the crown itself, and institute the rule of a democracy. Between these two is the great body of the middle class, a considerable portion of the educated and University trained, the majorities of the manufacturing towns, and perhaps, we may say, generally the non-conformists. There are some curious analogies in these two parties to our own parties before the war. It is, perhaps, not fanciful to suppose that the Conservative lords resemble our own aristocratic leaders of democracy, who contrived to keep near the people and had affiliations that secured them the vote of the least educated portion of the voters; while the great Liberal lords are not unlike our old aristocratic Whigs, of the cotton order, who have either little sympathy with the people or little faculty of showing it. It is a curious fact that during our civil war, respect for authority gained us as much sympathy from the Conservatives, as love for freedom (hampered by the greed of trade and rivalry in manufactures) gained us from the Liberals.

To return to the question of empire. The bulk of the Conservative party would hold the colonies if possible, and pursue an imperial policy; while certainly a large portion of the Liberals—not all, by any means—would let the colonies go, and, with the Manchester school, hope to hold England's place by free trade and active competition. The imperial policy may be said to have two branches, in regard to which parties will not sharply divide: one is the relations to be held toward the western colonies, and the other is the policy to be pursued in the East in reference to India and to the development of the Indian empire, and also the policy of aggression and subjection in South Africa.

An imperial policy does not necessarily imply such vagaries as the forcible detention of the forcibly annexed Boer republic. But everybody sees that the time is near when England must say definitely as to the imperial policy generally, whether it will pursue it or abandon it. And it may be remarked in passing, that the Gladstone government, thus far, though pursuing this policy more moderately

than the Beaconsfield government, shows no intention of abandoning it. Almost everybody admits that if it is abandoned, England must sink to the position of a third-rate power like Holland. For what does abandonment mean? It means to have no weight, except that of moral example, in continental affairs: to relinquish her advantages in the Mediterranean; to let Turkey be absorbed by Russia; to become so weak in India as to risk rebellion of all the provinces, and probable attack from Russia and her Central Asian allies. But this is not all. Lost control in Asia is lost trade; this is evident in every foot of control Russia has gained in the Caucasus, about the Caspian Sea, in Persia. There Russian manufactures supplant the English; and so in another quarter: in order to enjoy the vast opening trade of Africa, England must be on hand with an exhibition of power. We might show by a hundred examples, that the imperial idea in England does not rest on pride alone, on national glory altogether, though that is a large element in it, but on trade instincts. "Trade follows the flag" is a well-known motto; and that means that the lines of commerce follow the limits of empire.

Take India as an illustration. Why should England care to keep India? In the last forty years the total revenue from India, set down up to 1880 as £1,517,000,000, has been £53,000,000 less than the expenditure. It varies with the years, and occasionally the balance is favorable, as in 1879, when the expenditure was £63,400,000 and the revenue was £64,400,000. But to offset this average deficit, the very profitable trade of India, which is mostly in British hands, swells the national wealth; and this trade would not be so largely in British hands if the flag were away.

But this is not the only value of India. Grasp on India is part of the vast oriental net-work of English trade and commerce, the carrying trade, the supply of cotton and iron goods. This largely depends upon English prestige in the Orient, and to lose India is to lose the grip. On practically the same string with India are Egypt, Central Africa, and the Euphrates valley. A vast empire of trade opens out. To sink the imperial policy is to shut this vision. With Russia pressing on one side, and America competing on the other, England cannot afford to lose her military lines, her control of the sea, her prestige.

Again, India offers to the young and the adventurous a career, military, civil, or commercial. This is of great weight—great social weight. One of the chief wants of England to-day is careers and professions for

her sons. The population of the United Kingdom in 1876 was estimated at near thirty-four millions; in the last few decades the decennial increase had been considerably over two millions; at that rate, the population in 1900 would be near forty millions. How can they live in their narrow limits? They must emigrate, go for good, or seek employment and means of wealth in some such vast field as India. Take away India now, and you cut off the career of hundreds of thousands of young Englishmen, and the hope of tens of thousands of households.

There is another aspect of the case which it would be unfair to ignore. Opportunity is the measure of a nation's responsibility. I have no doubt that Mr. Thomas Hughes spoke for a very respectable portion of Christian England, in 1861, when he wrote Mr. James Russell Lowell, in a prefatory note to "Tom Brown at Oxford," these words:

"The great tasks of the world are only laid on the strongest shoulders. We, who have India to guide and train, who have for our task the educating of her wretched people into free men, who feel that the work cannot be shifted from ourselves, and must be done as God would have it done, at the peril of England's own life, can and do feel for you."

It is safe, we think, to say that if the British Empire is to be dissolved, disintegration cannot be permitted to begin at home. Ireland has always been a thorn in the side of England. And the policy toward it could not have been much worse, either to impress it with a respect for authority, or to win it by conciliation; it has been a strange mixture of untimely concession and untimely cruelty. The problem, in fact, has physical and race elements that make it almost insolvable. A water-logged country, of which nothing can surely be predicted but the uncertainty of its harvests, inhabited by a people of most peculiar mental constitution, alien in race, temperament, and religion, having scarcely one point of sympathy with the English. But geography settles some things in this world, and the act of union that bound Ireland to the United Kingdom in 1800, was as much a necessity of the situation as the act of union that obliterated the boundary line between Scotland and England in 1707. The Irish parliament was confessedly a failure, and it is scarcely within the possibilities that the experiment will be tried again. Irish independence, so far as English consent is concerned, and until England's power is utterly broken, is a dream. Great changes will doubtless be made in the tenure and transfer of land, and these changes will react upon England to the ultimate abasement of the landed aristocracy; but this

equalization of conditions would work no consent to separation. The undeniable growth of the democratic spirit in England can, no more, be relied on to bring it about, when we remember what renewed executive vigor and cohesion existed with the commonwealth, and the fiery foreign policy of the first republic of France. For three years past we have seen the British Empire in peril on all sides, with the addition of depression and incipient rebellion at home, but her horizon is not as dark as it was in 1780, when, with a failing cause in America, England had the whole of Europe against her.

In any estimate of the prospects of England, we must take into account the recent marked changes in the social condition. Mr. Escott has an instructive chapter on this in his excellent book on England. He notices that the English character is losing its insularity, is more accessible to foreign influences, and is adopting foreign, especially French, modes of living. Country life is losing its charm; domestic life is changed; people live in "flats" more and more, and the idea of home is not what it was; marriage is not exactly what it was; the increased free and independent relations of the sexes are somewhat demoralizing; women are a little intoxicated with their newly-acquired freedom; social scandals are more frequent. It should be said, however, that, perhaps, the present perils are due not to the new system but to the fact that it is new; when the novelty is worn off the peril may cease.

Mr. Escott notices primogeniture as one of the stable and, curious enough, one of the democratic institutions of society. It is owing to primogeniture that while there is a nobility in England there is no *noblesse*. If titles and lands went to all the children, there would be the multitudinous *noblesse* of the continent. Now, by primogeniture, enough is retained for a small nobility, but all the younger sons must go into the world and make a living. The three respectable professions no longer offer sufficient inducement, and they crowd more and more into trade. Thus the middle class is constantly recruited from the upper. Besides, the upper is all the time recruited from the wealthy middle; the union of aristocracy and plutocracy may be said to be complete. But merit makes its way continually from even the lower ranks upward, in the professions, in the army, the law, the church, in letters, in trade, and, what Mr. Escott does not mention, in the reformed civil service, newly opened to the humblest lad in the land. Thus there is constant movement up and down in social England, approaching, except in the traditional nobility,

the freedom of movement in our own country. This is all wholesome and sound. Even the nobility itself, driven by *ennui*, or a loss of former political control, or by the necessity of more money to support inherited estates, goes into business, into journalism, writes books, enters the professions.

What are the symptoms of decay in England? Unless the accumulation of wealth is a symptom of decay, I do not see many. I look at the people themselves. It seems to me that never in their history were they more full of vigor. See what travelers, explorers, adventurers they are. See what sportsmen, in every part of the globe, how much they endure, and how hale and jolly they are—women as well as men. The race, certainly, has not decayed. And look at letters. It may be said that this is not the age of pure literature—and I'm sure I hope the English patent for producing machine novels will not be infringed—but the English language was never before written so vigorously, so clearly, and to such purpose. And this is shown even in the excessive refinement and elaboration of trifles, the minutia of reflection, the keenness of analysis, the unrelenting pursuit of every social topic into subtleties untouched by the older essayists. And there is still more vigor, without affectation, in scientific investigation, in the daily conquests made in the realm of social economy, the best methods of living and getting the most out of life. Art also keeps pace with luxury, and shows abundant life and promise for the future.

I believe, from these and other considerations, that this vigorous people will find a way out of its present embarrassments, and a way out without retreating. For myself, I like to see the English sort of civilization spreading over the world, rather than the Russian or the French. I hope England will hang on to the East, and not give it over to the havoc of squabbling tribes, with a dozen religions and five hundred dialects, or to the military despotism of an empire whose morality is only matched by the superstition of its religion.

The relations of England and the United States are naturally of the first interest to us. Our love and our hatred have always been that of true relatives. For three-quarters of a century our *amour propre* was constantly kept raw by the most supercilious patronage. During the past decade, when the quality of England's regard has become more and more a matter of indifference to us, we have been the subject of a more intelligent curiosity, of increased respect, accompanied with a sincere desire to understand us. In the diplomatic scale Washington still ranks below the

Sublime Porte, but this anomaly is due to tradition, and does not represent England's real estimate of the status of the republic. There is, and must be, a good deal of selfishness mingled in our friendship,—patriotism itself being a form of selfishness,—but our ideas of civilization so nearly coincide, and we have so many common aspirations for humanity that we must draw nearer together, notwithstanding old grudges and present differences in social structure. Our intercourse is likely to be closer, our business relations will become more inseparable. I can conceive of nothing so lamentable for the progress of the world as a quarrel between these two English-speaking people.

But, in one respect, we are likely to diverge. I refer to literature; in that, assimilation is neither probable nor desirable. We were brought up on the literature of England; our first efforts were imitations of it; we were criticised—we criticised ourselves—on its standards. We compared every new aspirant in letters to some English writer. We were patted on the back if we resembled the English models; we were stared at or sneered at if we did not. When we began to produce something that was the product of our own soil and our own social conditions, it was still judged by the old standards, or, if it was too original for that, it was only accepted because it was curious or bizarre, interesting for its oddity. The criticism that we received for our best was evidently founded on such indifference or toleration that it was galling. At first we were surprised; then we were grieved; then we were indignant. We have long ago ceased to be either surprised, grieved, or indignant at anything the English critics say of us. We have recovered our balance. We know that since Gulliver there has been no piece of original humor produced in England equal to "Knickerbocker's New York;" that not in this century has any English writer equaled the wit and satire of the "Biglow Papers." We used to be irritated at what we called the snobbishness of English critics of a certain school; we are so no longer,

for we see that its criticism is only the result of ignorance,—simply of inability to understand.

And we the more readily pardon it, because of the inability we have to understand English conditions, and the English dialect, which has more and more diverged from the language as it was at the time of the separation. We have so constantly read English literature, and kept ourselves so well informed of their social life, as it is exhibited in novels and essays, that we are not so much in the dark with regard to them as they are with regard to us; still we are more and more bothered by the insular dialect. I do not propose to criticise it; it is our misfortune, perhaps our fault, that we do not understand it; and I only refer to it to say that we should not be too hard on the "Saturday Review" critic when he is complaining of the American dialect in the English that Mr. Howells writes. How can the Englishman be expected to come into sympathy with the fiction that has New England for its subject,—from Hawthorne's down to that of our present novelists,—when he is ignorant of the whole background on which it is cast; when all the social conditions are an enigma to him; when, if he has, historically, some conception of Puritan society, he cannot have a glimmer of comprehension of the subtle modifications and changes it has undergone in a century? When he visits America and sees it, it is a puzzle to him. How, then, can he be expected to comprehend it when it is depicted to the life in books?

No, we must expect a continual divergence in our literatures. And it is best that there should be. There can be no development of a nation's literature worth anything that is not on its own lines, out of its own native materials. We must not expect that the English will understand the literature that expresses our national life, character, conditions, any better than they understand that of the French or of the Germans. And, on our part, the day has come when we receive their literary efforts with the same respectful desire to be pleased with them, that we have to like their dress and their speech.

*Charles Dudley Warner.*

## TOPICS OF THE TIME.

### Coöperation in Christian Work.

THE praise of Christian unity is often chanted now-a-days; the grand chorus of the Evangelical Alliance stately joins in celebrating the excellency of its glory, and there is an unwritten liturgy of pleasant phrases, describing its delights, into which most Christians, in their devotions, spontaneously glide. Of this sort of sentiment there is even a surplusage. The terms in which it is commonly set forth have become so prodigiously inflated that they pass for much less than their dictionary value. Meantime, the schisms increase, the churches are multiplied far beyond the needs of worshippers, and the relation of the sects is practically one of rivalry.

Most of the great denominational assemblies devote a day to the reception of what are called fraternal delegates, and the speeches of these delegates are full of the sentiment of unity. But there is nothing in them more substantial than sentiment. Propositions looking toward the concentration of forces in Christian work are never heard in these places. The applause of the platforms would cease, and a coolness would soon fall upon the meeting, if any such suggestion were heard. Indeed, the speakers on these occasions are generally careful to explain that they do not expect or desire any practical union in Christian work. "Union," said a distinguished speaker at one of these meetings, not long ago, "union is chimerical; union is impossible; it is useless to talk of union at present; but we may have unity—the unity of the spirit; that we ought to pray for and promote in every possible way." Precisely. Union is concrete; unity is abstract; what the average "fraternal delegate" wants is an abstract or sentimental unity that will call for the sacrifice of no sectarian advantages.

Nevertheless, all these love-feasts of Christian fellowship, from the Evangelical Alliance down to the union prayer-meeting in the country villages, bear united testimony that the differences between the sects—between those called Evangelical, at any rate—are not of any real importance. In other words, they bear witness that the sectarian divisions of the Christian church in city and country, by which in so many places its power is destroyed and its glory turned to shame, all rest on non-essential differences.

There is a large body of Christian men in all the sects—mostly quiet men who do not talk much in the union meetings, but whose contributions support, in large measure, the churches and the missionary societies—who have been paying close attention to these useless divisions, and who are beginning vigorously to apply to them their logic and their common sense. "If the differences between these sects are so unimportant as you say," they argue, "why should they be perpetuated at such cost? Why should four weak churches, all substantially alike, be maintained in a small village, when one efficient church could be easily supported? Why should the

sects in the cities struggle on as rivals, rather than as allies, often crippling one another by their competition, getting in one another's way with their mission enterprises, having no stated consultations, and making no concerted effort to secure a harmonious and complete occupation of their common field? Such a waste of power, such a confusion of plans and purposes, would ruin any other enterprise. Why should this greatest of enterprises be crippled by divisions which, as you testify, are of no real consequence?"

These questions are beginning to be asked more and more earnestly, and by a class of men whom the sectarian managers will not wisely undertake to snub. The readers of this magazine have heard them asked more than once. The broad and genuine catholicity of Dr. Holland, and his invincible common sense, led him to urge these questions long ago, and he never ceased to press them upon the conscience of the churches. Almost a quarter of a century has passed since he wrote the essay on "The Lord's Business," included in "Gold Foil," in which he sent the truth home in this trenchant way:

"The call is uttered and echoed in every part of the world for more money and more men; but is it too much to say that enough of both have been squandered in the business management of the Christian enterprise to have carried Christianity into every household? The money expended in church edifices and inefficient governmental church establishments, and bootless and worse than bootless controversies, and the upbuilding of rival sects, would have crowned every hill upon God's footstool with a church edifice, and placed a Bible in every human hand. Further than this, if the men now commissioned to preach the Gospel were properly apportioned to the world's population, millions would enjoy their ministrations who never heard the name of Jesus Christ pronounced, and never will. The towns in Christendom which feebly support, or thoroughly starve, two, three, or four ministers, when one is entirely adequate for them, are almost numberless."

Those who followed the discussions of this department of the magazine through the years of Dr. Holland's editorship, know how often and strongly he struck this chord. Through his teaching, and the teachings of other men impressed with the same conviction, the truth of this matter has become the common property of a multitude of sagacious and influential business men in all the churches, and it is safe to predict that something good will come of it. The wicked and wasteful rivalries and competitions between sects that differ about non-essential matters will not always be tolerated. It will be necessary for the managers of the denominational machines to find a *modus vivendi*. The denominations may continue to exist for a long time, but they will be obliged to come to a better understanding, and not merely sing the praises of unity, but learn to unite in Christian work.

In promoting reforms of this nature, words are often things, and we beg to suggest a word which may help

in the solution of this problem. Suppose we stop talking of union and of unity, and begin to consider the duty of *coöperation* in Christian work. This is the desideratum — *coöperation*. In town and city and mission field, Christians, the disciples of a common Master, ought to *coöperate*. Can they *coöperate*? Who will deny it?

When we come to speak of the methods of *coöperation*, there is much to say. Here wisdom is wanted, but means will not be lacking to men whose hearts are set upon the attainment of the end. In the present number of the magazine begins a short serial by Dr. Gladden, devoted to the discussion of methods of *coöperation* in Christian work. We think our readers will agree with us in regarding it as among the most suggestive, practical, and entertaining studies of the subject that have yet been made. It is to be hoped that "The Christian League of Connecticut" will serve as a model for similar movements in other communities throughout the country.

#### The Dreaded American Aristocracy.

"WHOM the gods would destroy they first make mad." The insane persistency of the machine politicians in the system of political assessments, in the face of the exposure, protest, and ridicule of the public press, is likely to prove the death-blow of the system itself. During the last few months this whole subject has been elucidated in a manner altogether unprecedented. Nor was it necessary for the critics to argue dryly on general principles; the gentlemen of the machine were magnanimously active in furnishing current and striking examples of the sordid selfishness, hypocrisy, impropriety, cruelty, and absurdity of the proceeding. The pathetic stories of individual hardship with which the papers have teemed have been highly effective in stirring the public anger against this wholesale political robbery; but humor is sometimes a more powerful foe than the deepest pathos or the most savage satire, and from the time that the story started the rounds of the newspapers concerning the prompt and sweeping assessment of the cats in the Philadelphia Post-office, hubbiling in America became a difficult occupation indeed. Difficult, but not impossible,—for it is, in a sense, natural for a Hubbell to hubble; just as it is for a singer to sing, a canter to cant, a beggar to beg. But when public opposition to a practice like this takes not only the form of scorn, but of ridicule, it is much less easy to carry it on in the presence of a people whose bump of humor is so largely developed as is that of the people of America.

We have no intention to enter here into a general discussion of this subject, but wish merely to allude to a single phase of it. We have heard a great deal during the past few years about the dangers of an office-holding aristocracy. There is a class of patriots in this country whose thoughts by day and whose dreams by night are racked by the dread of an aristocracy of office-holders. We do not exactly know what the dreaded thing is. We know, of course, what an office-holder of the present day is: namely, a person who, putting behind him all selfish thoughts, all considerations of his own, his family's, or his friends' advancement or advantage, devotes himself solely and

assiduously to the responsible duties of a public office. What the patriots above referred to believe that such a man is to become, when civil service reform (that is, retention in office during good behavior) works its worst upon him, we have no means of knowing. But, from a cursory view of the aristocracy of "the mother country," where the genuine aristocrat is acknowledged to exist, we can imagine that the office-holding aristocrat of the future will hold large landed estates, be driven to his office in an old family coach (with his coat-of-arms on the door-panel), ride over the country on the trail of foxes (or the American anise-seed substitute therefor), sport a yacht, belong to all the best clubs in town, and date his family back, if not to the Conquest, at least to the *Mayflower* or to Pocahontas. Now it is most likely that we are all at sea in our endeavors to get at the idea of an office-holding aristocrat, such as scares the imagination of the American patriot. It cannot be just what we have thought it might be, though this is bad enough; it must be something altogether more nightmare-producing than this.

Yes, the office-holding aristocrat of the future must be an excessively terrible fellow, or he would not be so perturbing to the mind of the anti-reformer, nor would eminent reformers, like Mr. Godkin for instance, take so much pains to allay the fears of the gentlemen of the machine on this subject.\* It is evident that if clerks and heads of departments, all through the United States, in the custom-houses, in the post-offices, in the city-halls, in the court-houses, are to be kept in office "during good-behavior," they will immediately begin to behave badly. That is a self-evident proposition.

Let it be acknowledged, then, that without "rotation in office," the principles of American liberty will be undermined. But what, then, has Mr. Hubbell been about? Does he realize what it is to hubble, *i. e.*, to screw money for election purposes out of men, women, children, and cats, who can scarcely live on their incomes? Does he realize that by this process he has been laying the foundations of a gigantic and permanent "office-holding aristocracy,"—an aristocracy which is to perpetuate itself forever by a venal and shameless system?

#### The Exodus of Lunatics.

IN one of Mr. Charles Reade's enthusiastic novels, an attempt is made to picture the miseries of sane people improperly shut up by designing relatives in English lunatic asylums. So far as we know such cases are rare, either abroad or in America, and when responsible persons are wrongfully committed, it is either through the carelessness or ignorance of medical men who sign their commitment certificates. Of late, nevertheless, a number of persons held in American asylums for the insane have been pronounced of sound mind by Supreme Court judges before whom they have been brought, and promptly discharged,—one judge going so far as to say that the alleged lunatic was not insane, and never had been. This extraordinary piece of judicial assumption immediately raises the question

\* See "The Danger of an Office-holding Aristocracy," by E. L. Godkin, "The Century," May, 1882.

whether a judge, presumably ignorant of medicine, no matter how learned he may be in his own profession, has any right to decide questions concerning insanity as a disease,—for it is as much a disease as small-pox, and as peculiar in its expressions as other better understood affections.

We hold that no one is justified in saying, after nothing more than a brief examination in a court-room, that an individual is not insane because the alleged lunatic does not then act strangely, or because he happens to answer properly certain questions that may be put to him upon the witness-stand. It is frequently the case that if such a person is requested to talk upon other subjects than those suggested by the lawyer, he will burst forth into an insane and incoherent torrent of words. So, too, fifteen minutes before, or fifteen minutes after leaving the witness-stand, he may show unmistakable symptoms of mental disease. Some of the recent decisions in these cases are examples of all that is unwise and blundering, and, it may be assumed, are in conflict with the unprejudiced opinions of alienists and people of common sense, and it is to be feared that no reaction in public feeling will take place until a terrible act of violence is done by some crazy person who has been set at large.

If it were possible to follow the English laws, which in some respects are not to be improved upon, the friends of alleged lunatics who take the responsibility of commitment, no less than the lunatics themselves, would be protected. An unbiased board of commissioners is what is really needed, and the sooner we have it the better.

#### Wise Benevolence.

ONE of the significant facts of the recent social progress of the United States is the reaction which has set in against the giving of alms. If a census could be taken of the money received by beggars in New York city for each of the last ten years, we venture to say that it would show a decided and continual decrease in the total amount. This fact stands in the relations both of cause and effect to another fact,—that the benevolent work of the metropolis was never better organized than now. What with the religious missions, the loan associations, the fresh-air fund, the house-to-house visiting, the distribution of flowers and reading-matter to the sick, and many another well-devised agency, there is very little room for new organizations. Citizens have learned that these societies can do benevolent work better than they can themselves, and they are glad to delegate the functions to experts. For, in New York, a man must be an expert to be properly qualified to hand a dime to a street-mendicant, and here benevolent work has been reduced to such a science that we doubt not members of the State Charities Aid Association can tell almost to a cent how much that well-meant act will cost the city,—how much of the expense will go to the penitentiary, and how much to the alms-house.

The indoctrination of New Yorkers with the idea

that work is better than alms has been a large part of the labor of the above-mentioned association, an account of which will be found in the issue of this magazine for July, 1882. We print in the present number a more detailed account of another phase of the great charity reform which it has accomplished,—a paper which ought to reach especially every woman and every benevolently inclined person of wealth. It will be a great disappointment to many readers to learn, at the end of the paper, that this "new profession" in which they have become interested is not open to them. To devote so many pages to it seems like "hewing out roads to a wall." Why, one might ask, when there is such an excess of applications for admission to institutions like the Bellevue school and the Cooper Union women's class for wood-engraving—why should encouragement be offered to women to enter either? The answer is that it is this readiness of women to accept new opportunities for work as they are offered that will create for them further opportunities. When it is known that there is a natural demand for a certain class of work in which they have reached excellence, and that greater facilities are needed to enable them to pursue it, the door cannot long be closed to them, either for lack of money or by unthinking prejudice. No one can insure a livelihood to another in the new profession. Success will depend on the personal equation, and the individual must take or refuse the risks. Of the growing demand for trained nurses, however, there can be no doubt. A physician has recently said: "There are to-day not more than two hundred trained nurses doing private nursing in New York, while there are twenty-five hundred physicians; perhaps twelve hundred, or about half of these, do good and make a fair living. There should be nearly as many trained nurses at work in the same field. A physician in full practice frequently has from three to six nurses in charge of his private cases at one time." Other large cities offer no less promising a field.

There is a wise saw that it is better to keep an old friend than to make a new one. We put it to those of our wealthy men who are planning how they may best distribute money in public usefulness, whether they would not better intrust it to a well-organized, efficient institution that has learned its business, such as the Training School, than to pioneer some "new field," at a loss of a large per cent. for tutorship, organization, and "plant," as the manufacturers say. Here is an enterprise, that, beginning in the imagination of one wise woman, has included in its councils a large number of the most far-sighted, practical, and influential men and women of New York; that, starting as a theory, amid indifference or opposition, has set the copy for this class of work in America; that has purified the moral tone of hospital life and raised the standard of nursing throughout the country; and finally, that has opened to women of refinement a career at once honorable, dignified, and lucrative. Surely the managers of such an institution may safely be trusted to extend these opportunities as far as the generosity of Americans will permit.

## COMMUNICATIONS.

### Trial by Jury.

LAFAYETTE, IND., September, 1882.

EDITOR OF THE CENTURY MAGAZINE.

SIR: The experience of all who are familiar with courts and their workings, shows that a person who is seeking only justice never desires the intervention of a jury; that a jury trial is always the hope of the person who desires to perpetrate an injustice; and that with the aid of a jury there is always a chance, and often more than an even chance, of making the judiciary sanction a wrong. There is no one familiar with the courts and their workings who does not understand fully the great and usually controlling effect produced upon juries by certain elements, if present. Not unfrequently a woman or a child, being a party to a controversy, is the element which controls the action of a jury. An individual and a corporation being the parties to a suit, the individual secures the verdict of the jury. The estate of a decedent, who has left considerable property, and no wife or children, on the most meager proofs will, by a jury, be held liable to any demand, however preposterous. A jury will nearly always find against the validity of a will, if its provisions do not have its approbation.

These are a few of the many instances in which it is well known that the finding of a jury will be controlled, to a great degree, if not absolutely, by some matter which has not the remotest bearing on the merits of the controversy. The time occupied in a trial by jury, the long harangues on questions of evidence, are all to be set down, on the one side or the other, to the desire to get before the jury some evidence that is immaterial, but which will, probably, produce an effect on the finding; and not unfrequently an offer to introduce a particular piece of evidence, though rejected, produces the desired effect.

In the courts of the United States, the distinction between cases at law and in equity, and the English practice in each class of cases, have been substantially maintained. In these courts all equity cases are tried by the court, without the aid of a jury. The equity cases are those in which the largest interests are involved, the most complicated questions of fact determined, and the most intricate questions as to the rights of all parties having any interest in the subject matter of the litigation are settled. Yet the want of a jury is never felt in these cases, and the parties to them are much better assured of a righteous result than the parties to suits at law, where a jury trial can

be had. In the cases tried by jury in the Federal courts, the jury nuisance is not at its worst, for there the judge, as in the English courts, tells the jury substantially what to do, and promptly sets aside its verdict if it is not in accordance with his directions.

In Indiana, where the jury trial is a matter of right in every case, the bar association of the State appointed three eminent lawyers to report upon the jury trial, etc. A report was made by them, in which they say: "The practical working of this inflexible rule of trial by jury in all civil cases has been hurtful; in many cases it amounts to a denial of justice." That trial by jury is utterly unfit for the purpose of ascertaining the truth, in all cases where the truth is not easily and readily to be found, is a proposition warranted by the experience of all who are familiar with the working of the system. And this result of experience is the one ordinary reasoning would reach, independent of experience. May we not conclude, then, that the trial by jury is worse than useless in cases where the facts are complicated, and the truth can only be known after a careful and painstaking examination? If in such cases the jury trial is not an aid, but a hindrance, to the administration of justice, in what case can it be an aid? The trial by jury is not merely worthless, but it is very expensive. It would perhaps be a fair estimate to say that at least one-half of the entire expense of the administration of justice would be saved by abolishing the trial by jury.

All that has been said of the trial by jury, in cases between individuals, is equally true as applied to the trial of persons accused of crime. The criminal has an abiding faith in juries,—a faith which is well founded; so well, that of the guilty who are accused of crimes, but an insignificant fraction are convicted, rarely one who has the means to secure the full benefit of the protection to crime given by a jury trial.

It may be asked, what should be substituted for the jury? Nothing; wipe it out; let every cause be tried by the judge, and, if there is an appeal from his finding, let the case, by the appellate court, be reexamined on the whole evidence, and the rights of the parties finally settled. This reexamination, when the whole evidence is taken down by a short-hand writer, as it is now in all important cases, would insure the judgment of the appellate court on the merits of the controversy, and end it, and would be a perfect protection against mistakes, bias, prejudice, or corruption on the part of the judge who first hears the case.

Very truly yours,  
*Robert Jones.*

## LITERATURE.

### Bret Harte's "Collected Works."\*

MR. HARTE'S earliest volume was published, it seems, in 1865,—a "thin volume of verse," war poems and the like, of more than the average interest, and of considerable promise in character-sketching. Two years later came "The Condensed Novels," which showed a happy imitative and burlesque faculty, and a crisp, rapid movement, both qualities which entered into all Mr. Harte's later writings. The "Bohemian Papers," brief and spicy, came with the "Novels." The author claims for these years—1862-1866—two efforts in dialect, "The Society upon the Stanislaus" and the "Story of Miss," which strike the key-note of his most original work. The poem, as a specimen of serious humor, strikes the midriff as nearly as may be,—being as coarse and as fine as the best serious humor of the western slope. The "Story of Miss" touches the pathetic and opens the fountain of tears.

All these things were only locally known, until "The Luck of Roaring Camp" challenged a wider field. The author tells us how this story was tossed back from the blushing young lady type-setter of the "Overland Monthly" to the serious-minded printer; from him to the anxious publisher; from the publisher, with a solemn face, to the author; from the author, with firmness, to a "committee of three"; from the three, with irresolution, to the author again; and from him, with obstinate confidence, to the public—"without emendation, omission, alteration, or apology." So much local agitation was followed by local irritation. California was distressed, refusing to be comforted. "The religious press frantically excommunicated" the story, "and anathematized it as the offspring of evil." "Christians were cautioned against pollution by its contact." But the author waited confidently for "the larger verdict" of America; and the "return mail from the East brought a letter \* \* \* from the publishers of the 'Atlantic Monthly,' addressed to the—to them—unknown 'Author of 'The Luck of Roaring Camp.''" The letter was "opened and found to be a request, upon the most flattering terms, for a story for the *Atlantic* similar to the 'Luck.' The same mail brought newspapers and reviews welcoming the little foundling of Californian literature with an enthusiasm that half frightened the author." It was the beginning of fame. The "Luck" was soon followed by "The Outcasts of Poker Flat," "Miggles," "Tennessee's Partner," etc., which equipped the new genius for that literary triumphal procession across the continent that introduced him, with more than a flourish of trumpets, to the East.

The poems and stories which brought his "triumph" are much the best of Bret Harte's work. "He has reached his highest point," said one of the shrewdest judges of literary fire-works, when the "Heathen Chinee" had put the nation in a broad

grin; "he will never do anything so good again;"—and this is probably the sober judgment of critics and readers to-day. But then, the work of those early days was so good and so novel that it would bear some reiteration. The vein of ore was single, and the best of it was mined, yet the chunks still left were ore. How carefully the unsunned depths have since been searched is made clear as we run over these five volumes of "Collected Works." There is endless repetition and reiteration. There is much second-class material. But altogether there is a very respectable income of enjoyment to the reader. When we remember that Wordsworth, the most prolific genius of this century, left only about thirty poems which the candid reader can praise unmixedly, we ought to consider the half-dozen poems and half-dozen stories of Bret Harte's which are sure to live, as a sufficient contribution to American genius to give him fame.

It was assuredly the dawn of a new day for Western literature when those early productions appeared. We have since had free range in Western humor and pathos. One Horse Gulch and Poker Flat have become the head-quarters of plain and strong language—whether absolutely true to nature or not, the historians of the "Exodus of '49" must decide.

The dialectic peculiarities which Mr. Harte was perhaps the first to introduce us to were varied,—the old Spanish of Mission Dolores, the new Chinese, and many mixed specimens from the Eastern migration. He seemed born to catch and fix the characteristic features of each, and he caught and fixed them so admirably, that, like Sam Weller's lingo, his have become the standard varieties. Behind the dialects are the idioms, which are too racy for the Sunday-school and bring a moral indigestion to a good many worthy people. Some of these idioms were not indigenous to California, but came steeped in the honeydews of Kentucky. Behind them were the manners and morals, open and frank to a degree to which Truthful James does scant justice. Beside them Ah Sin's "little game" was "childlike and bland." The author admits that this state of morals was part of a "picturesque passing civilization," and one would be inclined to hope that a civilization was passing which made Grace Conroy the ideal lady and Arthur Poinsett the superb champion of manhood in Sacramento, and which left Jack Hamlin to carry off the honors of knightly courtesy. The picture is dark, as Mr. Harte paints it, but full of brilliant flashes of human kindness, for which flashes the author searches with much of the Dickens spirit and more than the Dickens fervor. One is sometimes led to think that the search had become a passion with him,—that some inherent quality of opposition had made him resolved to lie in wait on that road from Jerusalem to Jericho oftener than legitimate business called him, not only to bind up the wounds of him who "fell among thieves," but to soothe the injured sensibilities of the thieves themselves. He

\* The Works of Bret Harte. Riverside Edition. Collected and revised by the author. Boston: Houghton, Mifflin & Co.

was very, very merciful to Jack Hamlin,—but he believes in "mercy." "Of all the various forms in which Cant presents itself to suffering humanity," he says, "I know of none so outrageous, so illogical, so undemonstrable, so marvelously absurd, as the Cant of 'Too much mercy.'" Whether this kind of mercy is too merciful or not, we leave to the moralists.

In looking at the artistic work of these five volumes, two superior qualities strike us: the genius for climax, and the happy faculty of making sharp contrasts. Each becomes too much a trick at last, the use of which is traceable to the Dickens influence on a nature constructed after the Dickens pattern. But Dickens had more fertility, and gave us a new trick every time. He was, moreover, assiduous, and collected fresh material for each new volume, which our author does not do, nor does the latter handle large material skillfully. In "Gabriel Conroy," for example, one can hardly escape the conviction that he had written a series of brilliant short stories for the proper fusing of which he could obtain no sufficient heat. When he finally gets his persons together, it is by the use of the old superficial devices. In three diverse corners of the West, for instance, the same earthquake shakes Culpepper Starbottle temporarily out of five thousand dollars, Pete Dumphy, the arch-villain, out of a document highly important to the heroine, and Grace Conroy out of her snug retreat at the rancho of San Geronimo. It shakes a brace of villains out of a rich silver "lead," and a pair of excellent people into possession of the official documents which testify to their ownership in valuable mines. It shuts a prison-door against three Vigilantes and their followers, thereby gaining time for the escape of the hero, whom it afterward further serves by loosening for him a statue of Liberty, which he flings down upon the Vigilantes. This was pretty good for one earthquake, though, of course, quite possible,—just as Cooper's devices with the Pathfinder are quite possible; but an artistic novelist, following nature, and having premonitions of the present realistic school of fiction, would have devised another way, though with more expense, perhaps, to his inventive powers. But, whatever the artistic inequalities may be, and whatever the repetition of tricks that have made us laugh once, and whatever the sense we may get that genius is a marketable commodity, there can be no doubt of the *genius* which lies glittering, gem-like, throughout these five volumes.

In the last two stories, published since the above ("Flip," and "Found at Blazing Star," By Bret Harte. Boston: Houghton, Mifflin & Co.), there are no novel points. Miggles and Jack Hamlin would serve to indicate the leading characters. The early California blackleg is there, and if they are no longer blessed in California with the chivalrous breed, Mr. Harte keeps up the traditions in Lance Harriott, whose face is "rosy, round, shining with irrepressible good humor and youthful levity"; whose large, blue eyes are "infantine in their innocent surprise and thoughtlessness." He can still handle the cards, the deringer, and those dangerous blue eyes, as well as of old; and, indeed, is a hero and a scoundrel of the first water,—while "Flip," who succors him in distress, and "moons" over him, is ragged, unkempt,

saucy, and angelic up to the initial development of the pin-feathers. If she did not follow "Miss" and "Miggles," she would be a creation.

#### Underwood's "Longfellow."

THIS is one of those old-fashioned laudatory biographies, now happily becoming an extinct species. The facts of the poet's life are given in good order. There are the usual illustrations: frontispiece portrait; views of various houses by him inhabited; the Old Clock on the Stairs; inkstands in which was dipped that pen which, etc., etc.; desk on which were written those immortal works, etc., etc. There are testimonials from classmates at Bowdoin, and the appendix contains, among other miscellaneous matter, a valuable bibliography taken from "The Literary World," and a somewhat boastful exhibit of the sales of Longfellow's books.

It were greatly to be wished that no one would rush into the work of literary biography without having such modicum of dramatic talent as would enable him to present at least one figure on his stage; and so much critical acumen as to help him toward some understanding of the characteristics and limitations of the genius that he describes. One could willingly exchange several volumes of this literary job-work for a few keen, discriminating pages, which should get the man Longfellow and the portrait of his mind sharply before us. As to Mr. Underwood's fitness for the critical part of his task, a few of his statements will give a sufficient notion. According to these, the "Voices of the Night" "are wholly without parallel in our day, in the quality of touching and elevating the moral nature." "It may be questioned if any American audience ever heard it ['The Building of the Ship'] without giving the inevitable tribute of tears." "His readers are more numerous than those of any poet, except the Psalmist David." "In the extent and diversity of his works he stands the peer of any. If poets like Gray and Collins are immortalized by the few gems they added to our literature, what is to be said of Longfellow, who has produced fifty times as many,—most of them superior in force and beauty to the mosaics of the one or the classic odes of the other." "Excepting Goethe, and, perhaps, Schiller, there was none [of the German poets] more original and suggestive than himself." "He alone is entitled to be called the poet of humanity."

Our author's excursion into the controversy provoked by Poe's attack on Longfellow is not fortunate; and what he says about the poetry of Poe, Emerson, and Robert Browning is simply fatuous. As to the old question of Longfellow's originality, it does not turn, we conceive, on the point whether he did or did not borrow lines and phrases from Motherwell and other poets, or whether he took the measure and style of "Hiawatha" from the Finnish epic "Kalevala." He might have done much more than this without forfeiting any claim to originality; and Poe's furious onslaught was, of course, absurd and in parts crazily egotistic. The reason why originality in a high sense has been by many critics denied to Longfellow is that his genius was adaptive, sympathetic, and almost

\* Henry Wadsworth Longfellow. A Biographical Sketch by Francis H. Underwood. Boston: James R. Osgood & Co.

feminine in its character; that the intellectual problems of the age did not touch him; that much of his poetry was, as Margaret Fuller said of it, "exotic"; that while always sweet, graceful, and musical he was seldom strong, and never subtle or profound. He was best at a translation or when his mind was set working by books. His real weakness came out in his prose. It is impossible to imagine a man like Holmes or Lowell, *e. g.*, turning out such sentimental and rhetorical prose as that of "Hyperion." All these things have been said over and over again, and it seems ungracious to reiterate them. They do not detract from the great and genuine merits of our loved poet, whose tender and beautiful verse has won a popularity which is matter of pride to every American. But when his biographer undertakes to draw a picture, without either shading or proportion, it is right to remind him that *Definitio est negatio*. One may resent the suggestion sometimes made that Longfellow is the poet of young ladies' seminaries, and yet recognize the vast interval between him and such poets as Browning and Emerson.

Professor Sumner's "Andrew Jackson" (American Statesmen Series).\*

THE title of Mr. Sumner's volume is somewhat misleading. It is not so much a biography as an account of the politics and finance of Jackson's time. We get from it the impression of Jackson, less as an individual than as a public force, moving through the history of his times with relentless vigor. Of the play of individual passion and motive, of the development of character that led him into the various positions he assumed, we get little or no account. For these the reader must go to other biographies, particularly that of Mr. Parton, who, if he is inaccurate and inclined to make altogether too much of his subject, has the art of biography, the art of making us understand and sympathize, at least intellectually, with the career he describes.

Mr. Sumner has not himself sufficient sympathy with Jackson to enable him to do this. It would hardly be too much to say that his feeling for him is one of contempt. He sees in him little more than the accidental leader of a mob,—the mob being the people of the United States. This view has been taken before by a well-known critic of the Jackson period. In a passage which Mr. Sumner quotes with approval, Adams thus described the conditions of politics in 1834: "The prosperity of the country, independent of all agency of the Government, is so great that the people have nothing to disturb them but their own waywardness and corruption. They quarrel upon dissensions of a doit, and split up in gangs of partisans of A, B, and C, without knowing why they prefer one to another. Caucuses, country, State and national conventions, public dinners and dinner-table speeches two or three hours long, constitute the operative power of electioneering; and the parties are of working men, temperance reformers, anti-masons, Union and State-rights men, nullifiers, and above all Jackson men, Van Buren men, Clay

mën, Calhoun men, Webster men, and McLean men, whigs and tories, republicans and democrats, without one ounce of honest principle to choose between them."

If this was an exact or accurate picture of the politics of the country during the period between the close of the second war with England and Jackson's retirement from the Presidency,—and no one who reads Mr. Sumner's book will find a very different one in it,—it would be hard to understand how the prosperity of the United States referred to by Adams can be accounted for. Certainly not in the management of its finances, for here the history of the country is a history of crazy experiments, always resulting in disaster. Mr. Sumner, as an economist, dwells with a good deal of detail on the so-called "banking" of the period, and on Jackson's war with the United States Bank, and shows very conclusively that the idea of banking then prevalent throughout the country was simply that of furnishing a means of getting money to people who had no credit. The banks, too, were partisan institutions and were unscrupulously used to aid the party which chartered them. It is not too much to say that this notion of banking, by no means yet extinct, was the only one which was able to get a footing in the national mind down to the period of the Rebellion. Of the early part of the century Mr. Sumner says: "State banks at that time were distinctly regarded as political engines, each bank had a well-defined party character, and 'accommodated' only those of its own party. It seems that people then would have been as much astonished if a group of federalists asked for a bank charter from a Republican legislature as we should be now if a Republican should ask a Democratic House to elect him clerk." Again, "to read the doctrines and plans of 1814-15 one would think the people had thought that a bank manufactured capital out of nothing, and could give it away. Its main duty was to dole it out fairly, and if the existing banks did not do this, some more ought to be made. They talked about a man's 'right' to accommodation as if a bank resembled a town pump, at which every one might draw."

Whenever any large group of insolvent debtors wanted to relieve themselves from their embarrassments, or there was any great loss of property in the community, the creation of a bank was the usual means of relief that suggested itself. When Tammany Hall got into debt, a plan was formed for paying it by making a bank. When the great fire of 1835 occurred in New York, a proposition was brought forward to create a bank as a mode of relieving the sufferers.

Mr. Sumner thinks that the evils of the State bank system were quite as great, if not worse, than any possible disaster to be apprehended from the Bank of the United States, but he has not taken into account the enormous political power and opportunities for plunder the continuance of the old system would have lodged at Washington. The present national banks make the best banking system the country has ever known, and though their circulation is based on Government bonds, they are private concerns practically disconnected from politics, and the attempt to apply the "town pump" theory to them, and make them provide circulation to the various States in proportion to their population, has broken down. Jackson undoubt-

\* American Statesmen. Andrew Jackson as a public man. What he was, what chances he had, and what he did with them. By William Graham Sumner. Boston: Houghton, Mifflin & Co. 1882.

edly rendered a great service to the country, for which Mr. Sumner does not give him credit, in divorcing the federal administration and national politics from the business of banking.

Jackson was not a "statesman" in any proper sense of the word at all. He had almost no conception of the principles of government, and he had a furious and uncontrollable temper, which made it impossible for him to weigh evidence on any subject where personal antipathies were involved. He had, however, a blind belief in the future of the country, and in himself as a representative of it, which carried him through everything. He was, from the time of his early Indian fighting down to his retirement from politics, a despot; and his popularity came from his having an instinct for the kind of despotism the public wanted. He put down nullification in South Carolina, and removed the deposits from the bank, much as he hanged Ambrister and Arbuthnot in Florida. For law he cared nothing, and for law, during his time, the people of the United States cared little or nothing. The mob described by Adams were a frontier nation just beginning to feel their power. The traditions of the revolution and of federalism had died out. The Supreme Court under Marshall had done its work; the United States began to be feared without being much respected abroad. It was the period for an adventurer like Jackson to make himself the idol of the country, and he did it, by trampling law under foot, or by trampling resistance to it underfoot, as suited the occasion, but at every step making the national sense of growing importance stronger.

#### Blauvelt's "The Present Religious Conflict."\*

MR. BLAUVELT'S small book is intended as a sample. A "formal volume," or, perhaps, several formal volumes on the "Religion of Jesus" and "Supernatural Religion" are to follow this; in the future volumes the author will unfold more fully his theories. In this one he contents himself with the endeavor to prove that a crisis in theological thought has arrived; that the current orthodoxy is untenable; and that "a revision of the most revolutionary character" must be made of its fundamental doctrines. Mr. Blauvelt has strongly stated the objections to the received doctrines of inspiration, but he does not discuss the theory suggested by Professor Bruce and Doctor Newman Smyth, in which the Bible is treated as the record of the history of a people under special divine guidance. What answer he would make to this theory we cannot tell; possibly he might not dispute it. At any rate, he declares his belief that "the Bible contains, as well as professes to contain, an element which is in the form of a direct divine revelation." And, although he leaves us somewhat in the dark respecting his views of the nature of Christ, he strongly says: "It cannot be denied \* \* \* that the Jesus of the synoptical Gospels was a most pronounced believer in the supernatural. This Jesus believed in miracles. This Jesus believed in the efficacy of prayer. This Jesus believed in special providences. This Jesus believed in special and divine revelations. And this belief of Jesus in the supernatural, the miraculous, is

integral, inwrought, vital to his religious system" (page 120). When, therefore, he subsequently declares: "Our devotion to Jesus—the personal Jesus of history—is so great, our confidence in his religious system is so complete, and our consecration to his service is so absolute, that we are perfectly resigned, not only to follow after him in life, but to share his fortunes after death" (page 161), we are left to conclude that Mr. Blauvelt, like Strauss, has still a religion left, although he is rather chary about confessing it, and, notwithstanding the fact that, so far as the present volume reveals his temper, he is more ready to pull down than to build up. However, it is not fair to make a final judgment on this tentative and introductory essay. It should be added that Mr. Blauvelt writes, apparently, with conviction and sincerity.

#### De Kay's "The Vision of Esther."\*

THIS is a continuation of "The Vision of Nimrod" (reviewed in *SCRIBNER'S MONTHLY* for June, 1881). The specter of Esther, the priestess of the sunfane, appears to the Persian reformers and tells of her life as Nimrod's queen; her guilty passion for the high-priest Ahram; the cabals against the latter by Bitsu the eunuch; the madness of Nimrod; the ruin of the Tower of Babel and the plague in Babylon; Ahram's flight to the Mediterranean and his pursuit by Esther and Bitsu; the battle on the strand between fugitives and pursuers; and the final escape of Ahram, who sails away into the sunset. A third installment, to be entitled "The Vision of Ahram," will complete the series and will deal largely with America.

There is something impressive in the very size of Mr. de Kay's foundation plans; and the sincerity and boldness of the undertaking, on the part of so young a poet, ought to win sympathy from the generous reader. "The Vision of Esther" opens with the following invocation:

"Moon of the dusk, moon on the skirts of day,  
Scimitar moon gemmed with the star of even,  
Glad, as her cheek shyly from earth away  
Turns in the dark a virginal queen of heaven  
Sweetly you laugh, watching the weary rover  
O'er the rough wold open the low, dark door,  
And a fair maid draw to her breast the lover  
Whose image stands deep in her bosom's core:  
Moon of the trying tree  
Yellow of blee—"

In this musical stanza there is the strong pulse which beats in the author's best verse. The narrative of "Esther" is more direct and less interrupted by the striking but confusing episodes which abounded in the first part. A poem of so large a scope must be judged by the conduct of the story, the dramatic sufficiency of the characters, the skill and force displayed in the invention of situations. On all these points it would be premature to pronounce until the appearance of the third and final part shall have put the poet's entire conception before the reader. Only then can it clearly be seen whether he has made a permanent addition to our larger poetic literature, or whether he has produced another of those big, dead poems which are rescued from oblivion, if at all, only by an exceptionally fine passage here and there. Meanwhile we may confess to liking the narrative and

\*The Present Religious Conflict. By Augustus Blauvelt. New York: G. P. Putnam's Sons.

\*The Vision of Esther. By Charles de Kay. New York: D. Appleton & Co.

descriptive parts of both "Visions" better than the reflective and conversational portions. We have been sensible, especially, of a certain awkwardness in the dialogue passages.

In his preface, the poet calls attention to the bearing of his poem on modern problems. "Polygamy sits in the heart of the United States. The status of woman in Europe and America is unsettled. He brews are still treated with gross or refined injustice. The American judiciary is corrupt. The priest still aims at material conquests. \* \* \* In this relation, there is no need to mention the daily unfairness of the white races to the dark-skinned, especially in the United States." Doubtless these applications will be made more closely in "The Vision of Ahram," but we trust that Mr. de Kay will not be led away by the desire to point a moral, but will do his best to make his series a *poem* and simply a poem,—not a contribution to sociology.

We wish to call particular attention to the divisions of the book entitled "The Flight to the Ships" and "The Battle on the Strand," which are perhaps the most rapid and spirited portions of the whole. As an example of the author's narrative manner, we quote the two stanzas which tell what befell when Esther saw the vessel of her wounded lover disappear in the west:

"The waters widen, darken now. And I  
Perceive his weak hand raised to me in answer—  
Forgiving. 'Tis a mute and sad good-bye.  
Too bitter! As the stricken gull, the lancer  
Of silly fish, struck by a slinger's stone  
Meets the cold sea, I leaped insensate onward,  
Downward, and plunged,—I rose. I was alone.  
But on the arc of one great pallor sunward  
The shadowy hulls appeared  
Like specters weird.

"The oaths and cries are soothed to merest prattle,  
Against the sky uphoisted, square the yards,  
Outreel the sails; outdie the signs of battle,—  
A breeze upsprings. As moths will quit their shards,  
The moth-winged barks, like things that seek the splendor  
Of dayshine fled and glories of the sun,  
Stand on and on, until their outline slender  
Is etched, is sketched, is lost the west upon!  
Forever in that deep  
Methought to sleep."

These energetic and imaginative lines, in which the appearances of the horizon to a "man overboard" are indicated abruptly, and without wasting any words in the analysis of the swimmer's feelings, are very characteristic of what—if we wished to be pedantic—we might call Mr. de Kay's "method." With one more example from "The Battle on the Strand" we close our too brief notice of a very remarkable work:

"And for the third time Ahram reeled, the seeming  
Serenity that roused his foemen's wrath  
Shivered, as crack the faces cold of gleaming  
And moveless lakes below the whirlwind's path.  
But if the glacier glides its icy foot  
Below that wave, and clouds blot out the splendor  
Of sun—a jar—and through the liquid shoot  
Long crystals, catching in and in, to render  
The lake a clear dark block  
Hard as the rock."

Boker's "Book of the Dead."\*

WE confess to being puzzled as to the purpose of Mr. Boker's long poem. That it would never have been written but for Mr. Tennyson's "In Memo-

riam" is clear enough. It follows that wonderfully tender and beautiful poem afar off; but what else it is "after" is not so evident. Mr. Tennyson had a well-chosen theme for his pearls of sorrow. A friend was dead whose remarkable beauty of character and intellectual promise set him within the very edge of the public vision. Private grief bordered closely on public woe. Of this Tennyson took advantage, and, with exquisite art, molded that perfect expression of the sense of bereavement and of its spiritual alleviations.

Mr. Boker, too, has an under-song about which to cluster a versified wrath, but precisely of what public value it is we are unable to discover, nor will he tell us.

"'Tis not my purpose to explain  
The truths here dimly set in view;  
These hieroglyphics of the brain  
Are meant for others to undo."

"I hang my painted pictures high,  
I paint them ill, or paint them well;  
If they say nothing to the eye  
Then I have nothing more to tell."

What we make out—indeed, we are told it again and again—is that some one has died,—some dear friend, "the man of men most loved by me." He had been great and successful and much worshiped in life. He had done much for many men, including some treacherous friends:

"In life they played their cunning parts,  
They lauded everything he did.  
In death, they—bold, heroic hearts—  
Stabbed at him through the coffin-lid!"

But who this friend was, and who the Judas was that betrayed him, or any sufficiently definite notions of time, place, or person, we do not learn. Sometimes the anguish seems to be wholly personal; sometimes it appears to have a larger front, and the reader looks for great public wrongs that should call for such an out-pouring of a year's vials of wrath which are to sear the memory of the "Judas" forever:

"At times the patience of my soul  
With sudden rage is overflowed;  
I sparkle like an angry coal  
On which a furious breath is blown."

"In wrath my frenzied numbers roar,  
A brandished sword in every verse,  
And thus upon my foes I pour  
The flames of my prophetic curse."

But—one is continually asking through two hundred and fourteen pages—why so publicly and impotently? If it is a general sorrow, why may we not all know about it, and share it intelligently? If it is private, why such exorbitant curses and lamentations, lasting through a year? If this song is meant to reach out into the wide public experience and embrace all men's grief and passion, the tone of the lament should indicate it more constantly. And herein, it seems to us, is the failure of the poet's art. He does not establish his claim to touch the public heart. His anguish is too individual to express what is common to all, and it is not individual enough to direct our sympathies.

Mr. Boker was not wont to play hide and seek with his purpose in the days when he wrote "The Betrothal" and "The Widow's Marriage," "The Bal-

\* The Book of the Dead. By George H. Boker. Philadelphia: J. B. Lippincott & Co.

lad of Sir John Franklin," and "Königsmark." To be sure, he was wont to take us over to

"Merry London, his most kindly nurse,"

and set us down in some by-street, where we could listen to Coleridge at one remove, or to Shakspeare at two. But, in story-telling, he went straight to the mark. His *dramatis personæ* were clever, and knew what to say and how to say it well. They were witty and bright, full of action and quite capable of passion, which they showed, but said little about. They spoke old English, indeed, and had committed to memory all the old stage traditions. But, whether as old friends or as clever friends, we felt an interest in them from the moment when they stated their troubles, or planned their fun, until they laughed or cried themselves off the stage. In the "Book of the Dead" there seems to be both less art and less reality.

#### A Prairie Idyl.\*

THE author of "A Prairie Idyl" is intent on living, and enters the sacred precincts at once, not stopping often to brood over her relations to others. Her fancy is charming, because it is healthy and playful, and shows a joyous sympathy with all life about us. The picture which is drawn in this opening poem, of a certain half-wild, half-cultivated, idyllic nook in the woods, shows a close union between precise knowledge and the idealizing faculty. The quiet and beautiful seclusion of this nook are described. In winter come to it "brave snow-birds searching after seeds"; in April, "marsh-marigolds on mound and fen."

"And certain birds come seeking then  
For nesting-nooks aloft or low:  
Song-sparrow, bluebird, robin, wren,  
All new in love as one might know—  
Deliriously trilling.  
Oh, how the world enchanted them!  
They fluttered, floated, flaunted by,  
Set clinging feet on stalk or stem,  
And sent *roulades* into the sky  
As if it needed filling."

These musical visitors are followed by long processions of flowers.

"Ah, then, all out of perfect skies  
Rushed in the lover-bobolinks!  
Like Paganini, music-wise  
Each bird will tell you all he thinks  
On just that one-stringed viol.  
Should Handel, Mozart, Mendelssohn  
Set awful challenges afloat;  
This little master, all alone  
Half-way in Heaven, would tune his throat  
And dare them to the trial."

A fancy like this comes from a bright spirit; but there is a deeper meditative mood which is equally natural and healthful. The minor strain in such poems as "When I Call" is exquisitely quaint and pure, and echoes with a sweet and wholly spiritual quality, like the strains of an organ played in the remote corner of a German cathedral. Such poems reach our profoundest religious feeling, and express, even if they do not satisfy, our spiritual longings. If they call to mind George Herbert and other writers, it is nothing against their originality. To walk in the shadow of a

great man, and yet to walk worthily of his great moods, showing no weakness, is evidence of original powers.

There is a reminiscence—perhaps of Mrs. Browning—in the poem "From Saurian to Seraph," but the poem has a strength of its own which promises dramatic force, and a rapidity and ease of transition which indicate the fusing heats of a vivid imagination. Two stanzas serve to suggest a picturesque group in front of a blacksmith's shop,—a lady dismounting from her pony, the brawny blacksmith and his skill,—the beauty of the day, and the rural surroundings, and finally to launch us fairly on the blacksmith's story. He has served seven years at his trade in England, and has since been in forty-two battles.

"Oh, then I had rich times! then I was proud!  
You should have seen: the sabre in my hand  
Was just one red, and dripping like a cloud!  
There never was a life so glad and grand.  
But when the last ball's ricochet made rout,  
And the last shell tore up the bloody sod,  
I used to call my corps of blacksmiths out,  
And drive the nails till every beast was shod."

He had been himself a brute, as low as the Saurian, and as rude:

"I served ten years because I loved to slay,  
And, having fought, was fed. Oh, it was grand!  
My brutish blood ran richer day by day."

Then this same Saurian instinct had followed him from the "service" into the "slums," till a spiritual warning from his dead mother, who had been a Quaker, and the gentle hand of another living Quaker, had suggested less brutal and more helpful ways:

"A truer life I found,  
Caught at the golden lines of brotherhood,  
And scrambled from the mire to safer ground."

He became a diligent engineer on the Underground Railroad, worked and read,

"loved Junius, Cicero,  
And Whittier, made the sober Quakers quake  
For laughter, with my violin and bow."

"Meanwhile I took a wife;—for what's a man  
With all his loves at dry-rot in his heart?  
Unseasoned timbers—bound to mar the plan  
And sink the ship, however fair the chart.  
But a good wife is like a strong, sweet breeze  
That searches in and out and keeps all right."

Then came the rebellion, and he resumed the brute; recovered again, was taken and confined in a rebel prison for two years, was brought home an idiot, but recovered from that also, and rose by degrees from the Saurian stage to the point whence he could at least see the "Seraphs." The story is well told, and is tolerably full of good dramatic incident.

Besides this deeper strain,—which, as we have seen, can be passionate,—and a more simple, well-controlled thought, which is sometimes searchingly philosophical, the author has a sureness of ear, of taste, and of judgment, of a very high order.

We are authorized to say that the author of "A Prairie Idyl and other Poems" is Miss Amanda T. Jones, whose name our readers will recognize as having been associated with some of the most thoughtful and original of these very poems, when published for the first time in the pages of this magazine.

## HOME AND SOCIETY.

### The Legal Relations of Mistress and Servant.

THE relations of mistress and servant are so governed by custom and tradition that few ladies, in hiring cooks, chambermaids, or waitresses, and few cooks, chambermaids, or waitresses, in being hired, remember that they are entering into a legal relation. Neither party to this bargain is in the habit of appealing to the courts. No written contract is entered into, and possible litigation and damages are not, as in the case of most other contracts, kept constantly in view. Nevertheless, the relation of mistress and maid is subject to many well-defined rules of law, a few of which are of considerable practical importance. We say the relation between mistress and maid, because, in this country, the actual relations of servants are generally with the lady of the house, though, when it comes to litigation, the parties who appear in court are generally of the other sex. Usually the husband of the mistress is in law responsible for her dealings with her servants, while among servants a litigious disposition is rarely developed among the gentler sex. The rules of law, however, are the same for both sexes.

One of the questions which must frequently arise in any employer's mind is what remedy she has for simple idleness and neglect of duty on the part of a servant. The right of chastisement is obsolete, and the right to obtain a decree for what is known to lawyers as specific performance has never been recognized by the courts. Under these circumstances custom and law coincide in leaving only one course open, which, curiously enough, was that recommended by the learned Puffendorf two centuries ago, "to expel the lazy drones" and "leave them to their own beggarly condition." This advice Puffendorf derived entirely from his investigations into the law of nature. The common law of the United States is, however, precisely in accord with the law of nature, and its rule about idle servants, expressed in the vernacular of to-day, is simply to discharge them.

When they are discharged, is it the duty of the mistress to give them "characters"? This was settled long ago in the case of *Card v. Bird* (3 Esp., 201), decided in England, at the beginning of this century, by Lord Kenyon. The plaintiff's wife, having been dismissed from the service of the defendant, applied to a Mrs. S. for a situation. Mrs. S. was willing to take her if she could get a character from the defendant. The defendant refused to give her one, and she consequently brought an action. Lord Kenyon said that such an action had never been heard of then, and no such action has been heard of since. But, though the employer is not bound to give any character at all, she is at perfect liberty to do so, and if she does it she is bound to tell the truth, and not indulge in malicious insinuations. The rules of law with regard to servants' characters are simply those of a sound social morality. One or two cases decided in the English courts will show this and the rules

would be precisely the same in this country. Sir Gervas Clifton never complained of his butler's conduct while he was with him, but suddenly dismissed him without notice, and without a month's wages. The butler was not entitled to the month's wages, but refused to leave the house without them. A violent altercation took place, and a policeman was sent for who finally ejected the butler. Sir Gervas subsequently gave the butler a very bad character, and, in the course of it, made some charges which were not true. On these facts the butler recovered a verdict for twenty pounds. (*Rogers v. Clifton*, 3 B. and P., 587.) Under ordinary circumstances, characters given to or statements made about servants are what are known at law as "privileged communications," that is, they may be made, if made truthfully, without fear of the consequences. Thus, in another English case, a master discharged his cook and footman, and they asked him his reason for doing so; he told the footman, in the absence of the cook, that "he and the cook had been robbing him," and told the cook, in the absence of the footman, that he had discharged her because "she and the footman had been robbing him." It was decided that these statements were privileged, and that neither cook nor footman had any cause of action against him.

Disputes of this sort seldom get into the courts in this country, partly because we are less litigious than the English, and partly because work is easier to get here. A dispute which has been made the subject of adjudication here is one which, no doubt, often arises in practice between master and servant and mistress and maid; and that is, when the servant leaves the employment wrongfully before his or her term of service expires, is the employer bound to pay for the time? The old rule was that nothing was due. The modern rule is unsettled, but the better opinion is that the employer is bound to pay for the time actually given. In most cases, however, we presume the servant actually receives wages for the whole time.

G. S.

### "Going Abroad for an Education."

I HAVE read the article in the September *CENTURY* on "Going Abroad for an Education," with interest and hearty approval of the points made, with one exception. My observation and experience differ from those of the writer of that article in regard to the conditions upon which a young man can take a degree in a German university. He says the diplomas which Americans receive at German universities "are nothing more, as a rule, than certificates that they have pursued certain studies at these universities, and quite another thing from the degree which the German student receives. It is hardly within the range of possibility for a graduate from an American college, even if he 'reads a little German,' to be graduated at a German university."

Allow me to modify this statement. I am personally acquainted with at least a dozen graduates

from American colleges who have taken the degree of Doctor of Philosophy from German universities within the last seven years. The diploma in these cases is not mere certificate of studies pursued, but a certificate of the degree conferred "*propter egregiam \* \* \* scientiam dissertatione et examine adprobata*" — as reads one to which I refer, and which is identical with the diploma given to the German graduate. The examination is often undergone — at least in Göttingen — side by side with a German student, and no distinction is made between the American and German in regard to the questions. Every student, it is true, whether he be a candidate for a degree or not, has, in his *Anmeldungsbuch*, a certificate of studies pursued. This is a book which each matriculate receives, and in which he enters the lectures he proposes to attend. Following these entries are blanks for the treasurer's receipt for fees, and for the signatures of the professors at the beginning, middle, and end of the Semester, in certification of faithful attendance on their lectures. The book thus shows at a glance what lectures, etc., the student has paid for and attended. It is, however, not a certificate from the university, but rather a collection of individual certificates from the professors, of attendance merely.

As to matriculation at a German university, in no case within my knowledge has an American candidate been called upon to pass an examination on the studies of the gymnasium. His college diploma has, in most cases, been enough to secure his admission to the university privileges. The only examination he has to look forward to is the final one for his degree. "Annuals" are unknown.

Allow me to re-state, in the following terms, the conditions upon which a graduate of an American college, who "reads a little German," can take a degree in a German university. (1) Familiarity with the language. (2) The successful accomplishment of an original investigation in the student's specialty. (3) The presentation of a dissertation giving the results of this work (but not required, I believe, at Heidelberg). (4) A searching oral examination on the student's specialty and the branches subordinate to it.

John T. Stoddard.

#### A Young Folks' School of Observation.

OUR school system too often trains out of existence some of the most valuable faculties of the human mind. Children are taught to read and write and cipher till their mental vision becomes too short-sighted to note the infinite changes of earth and sky and water. The power to see, to discriminate, to interpret facts, is lost, and with it the great educational influences of later life. The curiosity of a child carries with it a divine intimation. He is not born a questioning animal, merely to drive to distraction the grown-up world to which he belongs. But, like every other God-given faculty, this curiosity needs to be wisely directed and judiciously repressed, or satisfied, as the case may be.

A mere book education is a very poor preparation for the real work of life. Scholars are proverbially impractical, and what is true of the extreme instance is, in a modified sense, equally true of those which are less extreme. There is no one mental quality of

such universal application in everyday life as the power of keen and accurate observation, and just this power an undue application to books destroys.

Anything which promises to supplement school training by the development of the observing faculty, merits the hearty sympathy and coöperation of all who are interested in the cause of education. This is exactly what the Agassiz Association proposes to do, while, at the same time, it gathers a fund of facts, and affords healthful amusement to the children interested in it. The idea of a Natural Science Association for children originated in Switzerland, but America was not long in following the example. Some years ago this American Society was organized at Lenox, Mass.

In the November number of the "St. Nicholas Magazine" for 1880, Mr. Harlan H. Ballard, the founder of the chapter at Lenox, published a little article, proposing a St. Nicholas branch to the Agassiz Association. The editor cordially indorsed the idea, and since then the pages of that magazine have been, from time to time, the vehicle of communication in matters pertaining to the Association. In response to the invitation issued in November, hundreds of letters came pouring in from children all over the land, and by the following February twenty-seven chapters, numbering over two hundred members, had been formed as parts of the St. Nicholas branch.

Mr. Ballard undertook to receive and answer the letters. The Association, at the expiration of twenty months, had, however, reached the number of three thousand four hundred members, etc., and the correspondence had become enormous, really beyond the management of one man. Mr. Ballard has therefore published a little hand-book,\* the one whose title is given at the bottom of this page, which is intended to answer many of these questions. It gives a history of the Association; directions how to form a chapter; suggestions as to the mode of writing; rules for the making and filling of cabinets; a list of the books to be consulted, and many other suggestions interesting and useful to a beginner in the fascinating study of science. The Association can scarcely be too highly commended as a happy combination of amusement and instruction, without the usual aimlessness of the one and the irksomeness of the other.

S. B. H.

#### "To Teach the Young Idea How to Shoot."

THE article upon "Children's Logic," by S. B. H., in the August CENTURY, struck a responsive chord in the heart of one who would like to add a word upon the subject. If, through life, our progress in reasoning could be made proportional to that of the first years of childhood, old age would find us much wiser than we are. But the natural powers of observation are too soon made to give place to the artificial training of the schools, when, with many children, mental development ceases. Many of us have grown up in utter ignorance of the beautiful things in nature by which we are surrounded, when, if we had received satisfactory answers to our eager, childish questions, we might have found a charm in the natural history taught

\* Hand-Book of the "St. Nicholas" Agassiz Association. By Harlan H. Ballard, Principal of Lenox Academy: Pittsfield, Mass.

in the schools, which, in its theoretical treatment, seemed to repel us.

It is indeed true that "mother" ought to mean more to children than it usually does; but this will never be so long as mothers of wealth, devoting their time to the pleasures of fashionable society, give up their children entirely to the care of illiterate servants; so long as the mothers of poverty work for the scanty food which sustains their children; or the mothers of the middle class, unheeding the mental and moral nakedness of their children, spend their time in making clothing which, in its elaborateness, is intended to rival that of the children of wealthy parents.

Why do we meet with so many uninteresting men and women, so many who dress well and talk well, so far as the grammatical form is concerned, but whose dearth of ideas is disclosed by the tendency to gossip? Mothers should make themselves interesting to their children, and answer their questions, instead of repelling them. If the questions are puzzling,—as many of them are,—the problems, if reasonable, should be solved, though days of earnest research be necessary to do it. Any mother of intelligence and ambition, with the means now within the reach of every one, can acquire a knowledge of botany, geology, zoölogy, and astronomy, which will render a walk with her children, by day or by night, a perfect delight to her and to them. These things will quicken their observation and make them more intelligent men and women; also happier, because no matter where their lot may be cast, the wonders of nature will be before their eyes, an everlasting source of enjoyment.

This is no dream of the imagination, which the outcome of a successful experiment. I could tell you of a little girl, six years old, who cannot read a word, but who knows many flowers, and how they grow, and can roughly classify them; who knows the names of some of the planets and constellations, and where to look for them; who delights in watching the ants, bees, and birds, and in hearing stories about them, and who expresses her ideas with ease and accuracy. All this has been accomplished without perceptible effort on the part of the child, though, of course, there has been earnest effort on the part of the mother.

*Lillian Mayne.*

#### A Family Ice-house.

MANY people imagine that domestic economy means a heroic going without; but true economy means a liberal use of everything that administers to good health. So far as ice is concerned, the best economy is to use it in profusion. Have as much as you want, but cut and store the ice yourself, or buy it at wholesale in winter, when it is cheap. Every family that has room enough out of doors for a small ice-house will save money by building one. It should be as much a part of the establishment as the refrigerator in the kitchen. It need not be unsightly, nor at all troublesome to keep in order. Charitable societies in cities give ice to the sick poor in hot weather, and if you are generous,—paradoxical as it may appear,—a well-filled ice-house will seldom be a source of coolness between neighbors.

Ice melts faster in free air than in confined air, faster in water than in confined air, and faster in the

sun than in the shade. It will melt in any ice-house; it simply melts slowly in a good one, and rapidly in a poor one. Reduced to its simple elements, the success of an ice-house depends upon site, drainage, ventilation, and construction. The best site for a family ice-house is some shady place under a tree, or the north side of a building which is also protected from the wind. Shade is of the first importance, and shelter from the wind the next; so, if there is a choice, take the shady place. If a good position cannot be found, put it anywhere. The melting ice in the house causes a constant flow of water. If the soil on which the house is to stand is sandy or gravelly, and has a gentle slope, there is nothing to do but to dig a cellar about two feet deep and fill it with stones. Cover the upper layers with smaller stones and sand. This will make the floor on which the ice is to rest. The water will escape easily through the sand and stones, and there will be no chance for currents of air to flow upward into the house. The tendency of the air in a badly made ice-house is always to flow through it. Therefore, while there must be drainage, there must be no inlets for air. If the soil is wet and not easily drained, the surface must be covered two feet thick with stones, and the house placed on top of this. If this is done, the sides of the stone work must be made tight with mortar, to prevent the entrance of air. If provision must be made for carrying off the water, the pipe must be trapped to prevent the air from entering the pipe and thus getting into the house. A well-drained foundation having been prepared, a wooden sill must be laid, on which the walls are to rest. On this sill will rest the uprights. These may be simply planks eight inches wide and two inches thick. They may be placed at intervals on the sill, and held in place by a string-piece on top. On the outside of the uprights may be nailed boards with battens or clapboards. On the inside they are simply boarded up with cheap stuff. The whole aim is to make a hollow wall. The space between the outside and inside boarding must be filled solid with tan-bark, saw-dust, or rough chaff of any kind. Upon the walls place a common pitch-roof, boarded and battened or shingled. It must be rain-tight, and must not be air-tight. There should be an opening at the ends, or a hood or ventilator, to permit a free circulation of air through the upper part of the house. The door should have double walls filled with saw-dust.

These, in brief, are the conditions: perfect drainage below, double walls filled with saw-dust, no entrance for air below, and free ventilation above. The ice should be laid on a foot of saw-dust or chaff, and a space of twelve inches all round between the ice and the wall should be filled with saw-dust, as well as all the cracks between the blocks. When it is all in the house, saw-dust is spread two feet deep on top of the ice. The cost of an ice-house must vary with the price of labor and materials. A house twelve feet square and ten feet high will hold enough ice for one family, and certainly will not cost much money to build. An ice-house should always be painted white, and, if convenient, it should be covered with vines, which will partly neutralize the heat of the sun's rays.

*Charles Barnard.*

## THE WORLD'S WORK.

### Boat Propulsion.

WHILE the power used to move ships has been made the subject of many experiments, and marine engines have been brought to a high degree of efficiency, the screw by which the power has been utilized has, in a certain sense, stood still. Its position at the stern has remained unchanged ever since it was first used. It has been tried at the bow, where it worked well enough, until it proved troublesome when brought in contact with drift-wood. It has been placed at the sides, where it operated only as an imperfect paddle-wheel. More recently it has been tried in an entirely new position. The vessel to which the new method of placing the screw has been applied is a lighter, designed for carrying heavy freight upon a crooked and shallow river. The hull, which is of wood, is about 28.35 meters (ninety feet) long, and 10.08 meters (thirty-two feet) wide, and draws about one meter, when loaded with one hundred tons of freight. In general appearance the boat does not differ from the ordinary steam-lighters used in American waters. The hull is of the usual shape, except at the stern. Here the after-body turns abruptly inward at the water-line, making a double curve toward the stern-post. Below the water-line, the hull carries a lip or projection that follows the ordinary lines of a ship's stern. In the concave recess on each side of the stern is placed a single screw facing outward. That is, the shaft carrying a screw at each end extends directly across the hull. This shaft is just at the water-line, and carries each screw half-submerged. The deck above each screw overhangs the hull, as in American river-boats. The engine (which for certain reasons is quite small for the boat) is placed between the two screws and directly connected with the shaft. On turning the two screws placed in this position, it would appear that they would act as paddle-wheels. They do so, but the amount of work performed in moving the boat is thought to be very small. Experiments seem to prove that the movement of the boat is caused by the streams of water turned by the screws against the wedge-shaped hull. The water thrown into the concave part of the stern cannot easily escape, and the result is the hull is thrust forward by the action of the water against it. The actual trials of the boat show that she can be moved with a full load, in rather rough water, at a speed of from four to five knots an hour. This is considered a good speed for such a boat, with an engine of such power. On the second trial trip, careful measurements were made of the power utilized by the screws. The boat was towed at her usual speed, and the amount of strain on the tow-line found by the aid of a dynamometer. The power needed to move the boat, compared with the actual working power of the engine, was found to be over fifty per cent. In other words, one-half the actual power of the engine appears to be realized in moving the boat. This is regarded as a very favorable showing for the position of the

screws. The trial trips of the new boat are regarded as interesting contributions to the question of screw-propulsion. The positions of the screws gives a good economy of the power employed, and in the new and faster boats, that are to be built upon the same pattern, even more interesting results may be expected.

### The Waterphone.

THIS is the name applied to a new mechanical device for observing, by means of sound, the flow of liquids in pipes. It consists of a metallic diaphragm inclosed in an ear-trumpet resembling a telephone. The diaphragm is connected and supported at the center by a slender steel rod that extends through the trumpet, while it is free on all sides and does not touch the trumpet in which it is inclosed. The object sought is to amplify any sonorous vibrations that may travel through the rod, so that, on placing the trumpet to the ear, the sounds may be heard. So far, the only use to which the apparatus has been put has been the detection of waste in city service-pipes. The apparatus is applied directly to the valve or stop-cock controlling the supply of water delivered at dwellings. The stop-cock is uncovered by opening the trap in the sidewalk, and the key is turned till the water is shut off. The steel rod of the instrument, which is threaded at the end, is then screwed into the top of the key. If any water is escaping past the stop-cock, or if the pipe leaks at this point, the sound of the moving water is heard in the waterphone. On letting the water flow freely into the house, any leaks or waste within may be detected in the same way. Any stream, however small, makes a sound, and by the aid of the apparatus it may be amplified or increased sufficiently in volume to enable the observer to tell how much water is running past the stop-cock. These observations are made at midnight, when the streets are quiet and when the water is supposed to be shut off within the house. The chief merit of the invention lies in the simple and convenient manner in which the sonorous vibrations caused by flowing liquids may be conveyed to the ear. While the apparatus has, so far, only been applied to the detection of leaks in water-pipes, it will, no doubt, find many other uses. It could be used to observe sounds caused by mechanical movements in places not easily accessible. It is practically an enlarged stethoscope for detecting obscure sounds. In some cities the stop-cock placed under the sidewalk is turned by a long rod let down into a small well in the walk. This rod has, in such places, been used to detect waste. It is simply held to the ear (and it might better be held in the teeth with the ears closed), when the sound of the water may be heard, the sonorous vibrations traveling along the rod to the ear, or, if held in the teeth, thence through the bones of the head to the ear. The diaphragm for amplifying the sounds is clearly an improvement on this.

## The Music Electrograph.

## New Motors.

THE suggestion was made in "The World's Work" for June (page 318, vol. xxiv.) that the common chemical telegraph systems, of which the American Rapid is an example, might easily be made to record music played upon an organ or piano. It now appears that this idea has been made the subject of experiment, and that a practical apparatus has recently been constructed to carry out this suggestion. The inventions were quite independent, and appear to have been made at about the same time. In the new apparatus the recording mechanism is quite independent of the instrument to which it is to be electrically connected. The aim is to cause the depression of a key of the piano to close a circuit, and to accomplish this a wooden bar is placed over the keys and resting at each end on the blocks at the sides of the key-board. From this bar are suspended, by wire rods, pellets, that rest one on each key, for about four octaves in the center of the key-board. Each of these pellets has a slight vertical play, and serves to make and break an electric circuit. While the key is untouched, the pellet is supported and the circuit is open. On depressing the key the pellet falls and the circuit is closed, and remains closed as long as the key is kept down. Wires connect each pellet with a small battery, and with a recording apparatus resembling the ordinary Morse recorder, the wires being insulated and twisted together into a cable. The recording apparatus consists of a clock train for moving a system of rollers, through which a ribbon of paper is caused to move. The first set of rollers moisten the paper with the chemical solution, this solution being the same as used in any chemical telegraph. The next system of rollers is both printing and recording, one roller making the lines in ink upon the paper that represent the musical staff, and the other being placed in the circuit from the battery. A style kept in position by a spring rests upon the ribbon, as it passes over this roller, there being a style for every circuit and for every note of the four octaves. The depressing of any key closes that circuit, and causes the current to flow through the style and through the moving paper, and, so long as the current passes, a blue stain is left on the paper. These stains represent the notes touched on the key-board. Another circuit, with a circuit-closing device in the form of a foot-pedal, is added to mark the bars or the beginning of each measure. From an examination of a portion of one of the stained ribbons, it appears the music staff is printed in narrow, black lines, there being four ledger lines above the treble staff and three below the bars, these being dotted lines to distinguish them from the others. The music is recorded in long and short stains, and in choral style of music can be read and played without serious difficulty. In the copy seen, the markings of the time was very indistinct, but, aside from this, it was clear enough to be played at sight, as from the common musical notation, and there appears to be no reason why any music could not be recorded in the apparatus, and with a little practice easily transcribed into the ordinary characters. So far as can be learned, the apparatus is a practical success.

Two motors, both designed to be independent of steam, have been recently carried through the experimental stage, and now appear to be ready for the severer test of actual work in business. Of the examples examined, one is a five horse-power engine, using crude petroleum as a fuel, and the other is a ten horse-power air-engine. Of the many experiments that have been made to use petroleum as a source of power, by far the larger part have been based upon the idea of using the oil as a fuel in making steam. In the new motor the oil is burned in or near the cylinder, very much as gas is burned in a gas-engine. In the engine examined, the cylinder is horizontal, and rests upon a stand or frame containing a tank for compressed air. The piston and the two piston-rods are hollow, the rods being connected by means of flexible tubes with the street-main, so that a constant circulation of cold water is kept up through one rod and the piston, and out through the other rod. There is also a water-jacket on the cylinder, the object being to keep all parts as cool as possible. At the end of the engine, and connected with the crank-shaft, is a small air-pump for keeping the air-tank filled with compressed air. The crude oil is kept in a tank near the engine, and is drawn from the tank as required in the engine, through a small pipe, by a small pump connected with the engine. The oil is delivered by the pump to a burner placed at the rear end of the cylinder. This burner has an annular wick, the oil being thrown upon the rear end of the wick, while the air needed for combustion is supplied from the compressed-air tank. To prevent the flame from passing into the cylinder, the end of the cylinder next the burner is covered with fine wire-netting. In the center of the burner is the inlet for the compressed air, the opening being controlled by a valve moved by the engine. There is also a governor for regulating the supply of air, the design being to cut off the air at any point of the stroke required. The engine is single-acting, and its operation may be easily understood. When it is desired to start the engine, the burner is lighted through an opening at the top, and the engine is given a few turns by hand to obtain a supply of compressed air. The piston being drawn back near the burner, the compressed air is allowed to enter. The immediate effect is a greatly increased combustion of the oil, and the air is heated and expanded. The expansion of the air is the immediate source of power, and under its influence the piston is driven backward, thus making the effective stroke. At the right point the supply of air is cut off, the stroke being finished by the expansion already obtained. At the end of the stroke the exhaust port, which is the same as the inlet at the end of the cylinder, is opened, and the spent air is allowed to escape while the piston is moved back by the momentum of the engine. The engine examined was not at work at the time, it having just been stopped for the purpose of painting; but, from reliable reports, it is said to work cheaply and easily, and with very little attention. It is believed to be the first motor of its class using a cut-off controlled by a governor, and having both the air and oil supply regulated by the speed and the amount of work put upon the motor.

The second motor is described as a differential high-pressure air-engine. By this is meant that heated air is employed as the source of power, the same body of air being continuously heated and cooled alternately, the difference between the pressure of the cold and the hot air being used to move the pistons in the cylinders. To accomplish this, four cylinders are used and arranged in pairs for the purpose of balancing one against the other. In each pair is a working-cylinder with a piston having a single action, or one effective stroke, and a larger cylinder in which the air is heated preparatory to its use in the working-cylinder. The four cylinders are upright and are grouped together, the larger ones of each pair being placed over the furnaces. The pistons in each of the larger cylinders are connected by means of their rods and link, and a rocking beam, thus balancing one against the other. The pistons in the two working-cylinders are also connected in the same way. Above each of the larger cylinders is placed a great number of small air-pipes and surrounded by a casing. Cold water is designed to circulate around these pipes precisely as in a condenser. There is also an air-pump and a water circulating pump connected with the engine. While these are the main features of the motor, the arrangement of the various parts is too complicated for explanation without the aid of intricate diagrams. It is sufficient to observe the principle upon which the engine works and to note the results.

The air used in the engine is confined and is employed over and over, alternately heated in the larger cylinder immediately over the fire, and then displaced by the movement of the piston and allowed to expand and thus spend its force in the working-cylinder. After the stroke is made, this same body of air, by the descent of the working piston (by the movement of the opposite piston), is passed to the condenser and goes through the small pipes back into the larger cylinder. On its passage through the small pipes it parts with a portion of its heat and is reduced in pressure. The power is thus obtained by the difference in pressure between the heated and the cooled air. The air above the pistons in the working-cylinders is not used as a source of power, as it is merely transferred through pipes from one cylinder to the other, and each stroke thus making the pressure above the pistons the same in each cylinder at all times. The motor examined was at work and appeared to run with great steadiness. It was silent, and moving at a speed of over eighty revolutions a minute. The engine has been at work for over a year, and has been put to a number of practical tests, the most severe being the running of a series of electric lights, and with entire success. It is reported, on good authority, to be very economical in fuel and oil; it certainly is easily managed, and is safe from all danger of fire and explosion. Engines of one or more hundred horse-power are soon to be built upon the same plan.

---

BRIC-À-BRAC.

Narcissus in Camden.

A CLASSICAL DIALOGUE OF THE YEAR 1882.

(*"In the course of his lecture Mr. ——— remarked that the most impressive room he had yet entered in America was the one in Camden town where he met ———. It contained plenty of fresh air and sunlight. \* \* \* On the table was a simple cruse of water."* \* \* \*)

PAUMANOKIDES. NARCISSUS.

PAUMANOKIDES.

Who may this be?

This young man clad unusually, with loose locks, languorous, glidingly toward me advancing,

Toward the ceiling of my chamber his orbic and expressive eye-balls uprolling,

As I have seen the green-necked wild-fowl the mallard in the thundering of the storm,

By the weedy shore of Paumanok my fish-shaped island.

Sit down, young man!

I do not know you, but I love you with burning intensity,

I am he that loves the young men, whosoever and wheresoever they are or may be hereafter, or may have been any time in the past,

Loves the eye-glassed literat, loves also and probably more the vender of clams, raucous-throated, monotonous-chanting,

Loves the Elevated Railroad employee of Mannahatta my city;

I suppress the rest of the list of the persons I love, solely because I love you,

Sit down *ilive*, I receive you!

NARCISSUS.

O clarion, from whose brazen throat

Strange sounds across the seas are blown,

Where England, girt as with a moat,

A strong sea-lion, sits alone!

A pilgrim from that white-cliffed shore,

What joy, large flower of Western land!

To seek thy democratic door,

With eager hand to clasp thy hand!

PAUMANOKIDES.

Right you are!

Take then the electric pressure of these fingers, O my Comrade!

I do not doubt you are the one I was waiting for, as I loaf'd here enjoying my soul,  
Let us two under all and any circumstances stick together from this out!

NARCISSUS.

Seeing that isle of which I spake but late  
By ignorant demagogues is held in fee,  
The grand Greek limbs of young Democracy  
Beckoned me thence to this ideal State,  
Where maiden fields of life Hellenic wait  
For one who in clear culture walks apart  
(Avoiding all rude clamors of the mart  
That mar his calm) to sow the seeds of great  
Growths yet to be—the love of sacred Art,  
And Beauty, of this breast queen consecrate,  
Whose throne mean Science seeks to violate;  
The flawless artist's lunacy serene,  
His purely passionate and perfect hate  
And noble scorn of all things Philistine.

PAUMANOKIDES.

Hold up there, Camerado!  
Beauty is all very good as far as it goes, and Art the perpetuator of Beauty is all very good as far  
as it goes, but you can tell your folks,  
Your folks in London, or in Dublin, or in Rome, or where the Arno flows, or where Seine flows,  
Your folks in the picture-galleries, admiring the Raphaels, the Tintoretos, the Rubenses, Vandykes,  
Correggios, Murillos, Angelicos of the world,  
(I know them all, they have effused to me, I have wrung them out, I have abandoned them, I have  
got beyond them.)—

NARCISSUS (*aside, with tenderness*).

Ah, Burne-Jones!

PAUMANOKIDES.

Tell them that I am considerably more than Beauty!  
I, representing the bone and muscle and cartilage and adipose tissue and pluck of the Sierras, of  
California, of the double Carolinas, of the Granite State, and the Narragansett Bay State, and the  
Wooden Nutmeg State!  
I, screaming with the scream of the bald-headed bird the eagle in the primitive woods of America my  
country, in the hundred and sixth year of these States!

Dear son, I have learned the secret of the Universe,  
I learned it from my original *bonne*, the white-capped ocean,  
I learned it from the Ninth-Month Equinoctial, from the redwood-tree, and the Civil War, and the  
hermit-thrush, and the telephone, and the Corliss engine,  
The secret of the Universe is not Beauty, dear son, nor is it Art the perpetuator of Beauty,  
The secret of the Universe is to admire one's self.  
Camerado, you hear me!

NARCISSUS.

Ah, I too loitering on an eve of June  
Where one wan narciss leaned above a pool,  
While overhead Queen Dian rose too soon,  
And through the Tyrian clematis the cool  
Night airs came wandering wearily, I too,  
Beholding that pale flower, beheld Life's key at last, and knew

That love of one's fair self were but indeed  
Just worship of pure Beauty; and I gave  
One sweet, sad sigh, then bade my fond eyes feed  
Upon the mirrored treasure of the wave,  
Like that lithe beauteous boy in Tempe's vale,  
Whom hapless Echo loved—thou know'st the Heliconian tale!

And while heaven's harmony in lake and gold  
Changed to a faint nocturne of silvern-gray,  
Like rising sea-mists from my spirit rolled  
The grievous vapors of this Age of Clay  
Beholding Beauty's re-arisen shrine,  
And the white glory of this precious loveliness of mine!

PAUMANOKIDES.

I catch on, my Comrade!  
—You allow that your aim is similar to mine, after all is said and done.  
Well, there is not much similarity of style, and I recommend my style to you.  
Go gaze upon the native rock-piles of Mannahatta, my city,  
Formless, reckless,

Marked with the emerald miracle of moss, tufted with the unutterable wonder of the exquisite green grass,  
 Giving pasture to the spry and fearless-footed quadruped the goat,  
 Also patched by the heaven-ambitious citizens with the yellow handbill, the advertisement of patent soaps, the glaring and vari-colored circus poster:  
 Mine, too, for reasons, such arrays;  
 Such my unfettered verse, scorning the delicatessen of dilettantes.  
 Try it, I'll stake you my ultimate dollar you'll like it.

NARCISSUS (*gracefully waiving the point*).

Haply in the far, the orient future, in the dawn we herald like the birds,  
 Men shall read the legend of our meeting, linger o'er the music of our words;

Haply coming poets shall compare me then to Milton in his lovely youth,  
 Sitting in the cell of Galileo, learning at his elder's lips the truth.

Haply they shall liken these dear moments, safely held in History's amber clear,  
 Unto Dante's converse bland with Virgil, on the margin of that gloomy mere!

PAUMANOKIDES.

Do not be deceived, dear son;  
 Amid the choruses of the morn of progress, roaring, hilarious, those names will be heard no longer.  
 Galileo was admirable once, Milton was admirable,  
 Dante the Italian was a cute man in his way,  
 But he was not the maker of poems, the Answerer!  
 I Paumanokides am the maker of poems, the Answerer,  
 And I calculate to chant as long as the earth revolves,  
 To an interminable audience of haughty, effusive, copious, gritty, and chipper Americanos!

NARCISSUS.

What more is left to say or do?  
 Our minds have met; our hands must part.  
 I go to plant in pastures new  
 The love of Beauty and of Art.  
 I'll shortly start.  
 One town is rather small for two  
 Like me and you!

PAUMANOKIDES.

So long!

*Helen Gray Cone.*

#### PAGES FROM AN ALBUM.

THE little book, some of whose pages we herewith reproduce, is a tiny autograph album, whose blue plush covers contain not a mere list of names wrung from bored but complaisant notabilities, but all sorts of willing and charming tributes of friendship in verse, in prose, in picture. We can no farther tell who is the owner of this marvelous little album, than that it is a young American. It is in the name of charity that she lets us print (with the consent of the authors and their representatives) two of its most notable contributions. The slight but graceful verses of Longfellow were, he himself said at the time, the only ones that he ever wrote originally for an album. The Browning lines have a personal interest; the first ten appeared in one of his latest volumes; the last ten are new, and are in explanation (where none should have been demanded) of one of his finest and most characteristic utterances.

*"Touch him men so lightly, into song he broke:  
 Song so quick-receptive - not one feather, seed,  
 Not one flower-dust felt but straight it fell awoke -  
 Vitalizing virtue: song would song succeed  
 Sudden as spontaneous - prove a poet-soul!"*

*Indeed?*

*Not so the song-soil rather, surface hard and bare:  
 Sun and dew their mildness, storm and frost their rage  
 Vainly both expend - flowers few awaken there:  
 Quiet in its cleft broods - what the after-ages  
 Knows and names a pine, a nation's heritage.*

thus I wrote in London, musing on my betters,  
 Poet's dead and gone: and lo, the critic's child  
 "Out on such a boast!" as if I dreamed that fetters  
 Binding Dante, bind up - me! as if, true, pride,  
 here, not also humble!

So I smiled and sighed  
 As I sped your book in Venice this bright morning;  
 Sweetest friend of mine! and felt the clay or sand  
 "What is in my soil he - break - for praise or scolding -  
 Out in grateful fancies - weeds, but weeds uprooted  
 Almost into flowers - held by such a kindly hand!  
 Robert Browning. Venice, Oct. 14. '80.

She who comes to me and pleads death  
 In the lovely name of Edith,  
 Will not fail of what was wanted.  
 Edith means the "Blessed"; therefore  
 All that she may wish or care for  
 With such a best for her, be granted!

Johnny M. Longfellow

## THE SUPREME COURT OF THE UNITED STATES.

THE Supreme Court is the balance-wheel of government in the United States. It does its work so quietly, and its operations touch the lives and business affairs of so few citizens, that much less is known about it than about any other portion of the Federal machinery. Rarely do its proceedings attract public attention; yet it may be truly said to be the conservative force in our political system, holding all the parts together and keeping each in harmony with the plan of the whole. We are apt to think ours a simple system; it is in reality a complicated one, for we have both a divided and a concentrated sovereignty, and the functions of authority are distributed between the state and the nation, and among different departments of each, in such a way that innumerable conflicts would occur to strain and perhaps finally destroy the framework of popular government, were it not for the regulating power of the supreme judicial tribunal. On several occasions in the history of the Great Republic, the power of the Supreme Court has been more than regulative, and has assumed a formative character. In its early stages especially, the form itself of the central government was largely shaped by the decisions which came from the Supreme Bench, interpreting the Constitution, then an elastic compact, not hardened by time and use, and one of untried and doubtful force as a bond to hold the States together and create from them a homogeneous nation.

The visitor in Washington is likely to be more favorably impressed with the Supreme Court than with any other feature of government he sees. The House is a turbulent town-meeting held on a velvet carpet. The Senate, which used to be sedate and courteous, is fast falling into the bad manners of the lower branch of Congress. Speeches are rarely listened to, and there is a general appearance

of lounging inattention, varied only by letter-writing or conversation, carried on under the very nose of the senator who is on the floor, seeking to influence the judgment of his associates. The White House is a business office, with a few showy rooms for formal receptions, and the President is approached like the head of any important business concern, with little more ceremony than is observed in a bank or a railroad office. The Supreme Court seems, by its quiet and stately dignity, to typify more fitly the power of a government which holds the lives and fortunes of fifty millions of people in its keeping.

Midway in the rather dingy and ill-lighted passage that leads from the great rotunda of the Capitol to the Senate wing sits a colored man holding a cord attached to the handle of a closed door. If you pause, as if desirous of entering, he pulls the cord; the door opens and you are in a narrow vestibule. Another door swings inward silently, and another colored man politely motions you to a seat on the crimson cushions of a big sofa. A high screen in front of the door hides the room from you when you first enter, but once on the sofa you find that you are in the Supreme Court chamber. Suppose it to be a few moments before noon. The long row of big, easy-chairs, on a high platform back of a desk of equal length, are still vacant, for the court meets at twelve. You have time to study the room. Its form is that of a semi-circle, with a half-dome for the ceiling, pierced by sky-windows, through which a mild light falls on crimson curtains and upholstery, and on the pleasant gray tint of the walls. A small gallery over the judges' seats is supported by pillars of the peculiar mottled gray and black stone called Potomac marble, and pilasters of the same stone relieve the circling sweep of the wall. Behind the pillars and under the gal-

lery there are heavily curtained windows, and a screened passage leading to the retiring-room of the judges on one hand, and to the marshal's office on the other. Upon the wall are busts of the six Chief-Justices who preceded the present incumbent,—Jay, Rutledge, Ellsworth, Marshall, Taney, and Chase. The greater part of the floor-space is railed off for the members of the bar. Outside of this are the sofas for spectators—the only really comfortable seats for public use to be found in the Capitol. The gallery is never used now. Only once, since the Senate left the room to go to its new chamber in the north wing of the building, has it been tenanted. That was during the sessions of the Electoral Commission which disposed of the Presidency during the memorable winter of 1877. Then the reporters for the press were squeezed day after day into its narrow limits.

When twelve o'clock comes, there are perhaps a dozen lawyers sitting at the tables within the bar, and a score of spectators waiting on the crimson plush sofas for the court to open. A rustle of silk is heard from the open door leading to the retiring-rooms.

DETAIL OF IONIC CAPITAL IN THE SUPREME COURT CHAMBER.

At the other side of the chamber sits a young man at a desk, who has been listening for a few minutes for that sound. He rises, and announces in a clear voice: "The Honorable the Chief-Justice and Associate-Justices of the Supreme Court of the United States," whereupon lawyers and spectators all get up on their feet. The rustling sound approaches, and there enters a procession of nine dignified old men, clad in black silk gowns that reach almost to their feet, with wide sleeves and ample skirts. At the head walks the Chief-Justice, and the

others follow in the order of their length of service in the court. They stand a moment in front of their chairs, and all bow at once to the bar. The lawyers return the salute; then the judges sit down, the Associates being careful, however, not to occupy their chairs before the Chief-Justice is settled in his. Now the young man, who is the crier, exclaims, in a monotonous fashion:

"Oyez! oyez! oyez! All persons having business before the Honorable Supreme Court of the United States are admonished to draw near and give their attention, for the court is now sitting. God save the United States and this honorable court!"

Business begins promptly and is dispatched rapidly. First, motions are heard, then the docket is taken up. The Chief-Justice calls the case in order in a quiet tone, and a lawyer is on the floor making an argument, while you are still expecting that there will be some further formality attending the opening of so august a tribunal.

The proceedings are impressive only from their simplicity. Usually the arguments of counsel are delivered in low, conversational tones. Often the judges interrupt to ask questions. In patent cases, models of machinery are frequently used to illustrate an argument, and are handed up to the judges for examination, or a blackboard is used for diagrams. Were it not for the gray hair and black gowns of the judges, you might almost imagine at times that the gentleman at the blackboard, with crayon in hand, was a college professor lecturing to a class. Or you may happen in when a lawyer in charge of a case is leaning over the long desk in front of the judges, holding a conversation with one of them on some intricate point in a mechanical device, and you would hardly think that the court was in session and that the conversation was the plea in a patent case involving perhaps a million of dollars.

The bench has long been only a tradition in all our courts. Each justice of the Supreme Court has a chair to suit his own notions of what constitutes a comfortable seat. Some of the chairs have high backs to rest the head, some have low backs; some have horse-hair cushions, some velvet, some no cushions at all. Chief-Justice Waite sits in the middle of the row. At his right is the Senior Associate-Justice, Samuel F. Miller, of Iowa; at his left the next in rank, Stephen J. Field, of California. Then right and left, alternately, are Justices Joseph P. Bradley, of New Jersey, John M. Harlan, of Kentucky, William B. Woods, of Georgia, Stanley Matthews, of Ohio, Horace Gray, of Massachusetts, and Samuel F. Blatchford, of New York. Justices

JOHN JAY. (AFTER THE BUST BY JOHN FRAZEE.)

Miller and Field were appointed by President Lincoln,—the former in 1862, and the latter in 1863. Bradley was appointed by President Grant in 1870, and the Chief-Justice by the same President in 1874. Harlan, Woods and Matthews were appointed by President Hayes; but Matthews's nomination was not acted on by the Senate until Hayes's term expired, and he was renominated by President Garfield, and thus represents two administrations. Gray and Blatchford are the nominees of President Arthur.

There is a tradition that the justices wore red gowns in the early days of the court. One of the present justices, who is an authority on the history of the court, says that it is a mistake arising from the fact that the first Chief-Justice, John Jay, in the portrait that hangs in the consultation-room, wears a robe with broad scarlet facings, and collar and sleeves of the same color. This gown was borrowed by Jay of Chancellor Livingston, and when the court determined upon a costume, it was a plain black silk gown just like that now worn. In the higher tribunals of the States, scarlet gowns were worn in many instances as late as the second decade of the present century. The first Judges of the Supreme Court did not

adopt any peculiar fashion of wig as a mark of their office. The English judicial wig was in vogue in the State courts; but the short wig, or the plain pig-tail, appears to have been the head-gear worn by Jay and his associates. At all events, when Cushing, who was one of the members of the original court, arrived in New York, and put on the big wig he had worn on the Massachusetts bench to go to the first meeting, he was followed up Broadway by a mob of boys, who pointed at his extraordinary attire, but otherwise showed him no disrespect. To avoid being so unpleasantly conspicuous, he hastened to a shop and bought a peruke of the then current fashion.

Every Saturday, during a term of the court, the justices meet in the consultation room to decide cases. The room is a cheerful, old-fashioned apartment, with windows on two sides, looking toward the Senate and the city. The carpet dates back to 1860, but it looks as fresh and whole as if it had enjoyed the care of an economical housewife in the little-used parlor of some New England country-house. The chairs are of rose-wood and hair-cloth, and of an indescribable fashion,—a cross between an ancient ottoman and the curule chair of a Roman senator. On the walls hang portraits of Marshall, Jay, and Taney. The arguments of the justices, when they assemble by themselves in this room, are often more thorough and able than those heard from the lawyers in the court. All the cases must be examined by all the justices; but when a decision is reached, the Chief-Justice designates the justice who is to write the opinion. Opinions are read and approved in the consultation room before they are delivered in open court. If there is disagreement, the dissenting judges arrange among themselves as to the preparation of their opinion. It is voluntary on their part, and not the business of the court.

The business of the Supreme Court is divided into two general classes,—cases in which it has original jurisdiction, and cases which come to it by appeal from the lower courts. If a citizen of the United States wants to sue a foreign minister or consul for debt, he cannot have recourse to any State tribunal, but must go directly to the Supreme Court. The secretaries and attachés of foreign ministers, and even their servants, are included in the immunity from ordinary processes of law, the house of the minister being, theoretically, foreign territory, and its inmates under the protection of the flag of the foreign country represented by the legation. To invade this sacred domain nothing suffices but the process of the highest court

ROGER B. TANEY. (FROM A PHOTOGRAPH BY BRADY.)

of the land. If, therefore, the pastry-cook of the Peruvian Minister should fail to pay a grocer's bill, the only way to collect it by legal constraint would be by invoking the power of the Supreme Court. In like manner, a minister or consul can go to the same tribunal to prosecute a suit against any citizen, the constitutional provision on the subject working both ways. It is to the credit of foreign representatives residing in this country that it has rarely been invoked. Another class of cases in which the court has original jurisdiction embraces suits of one State against another State, or of a State against a citizen of another State. Where a State is called upon to respond to the complaint of another State, a subpoena is served upon the governor and attorney-general of the responding State, by the marshal of the court, and the attorney-general appears and makes answer. What would be done if in such a suit a decision for damages were rendered, and the State beaten in the litigation should refuse to pay, is an undetermined question touching the theories of State rights and sovereignty. Could the marshal levy upon a state house or other tangible property of the defendant and sell it at auction? No case has arisen in which the power of the court to recover a money judgment against a State has been tested.

A State may sue a citizen or citizens of another State; but a citizen cannot sue a State—

an injustice growing out of the old English common law maxim that the king can do no wrong. Thus, Georgia may sue a citizen of New York before the Supreme Court for breach of contract or debt, but the citizen cannot sue Georgia to recover the money she owes him on a repudiated bond. Under the constitution as first adopted, a State was responsible for her debts. One of the earliest decisions of the Supreme Court, which may still be read in fair round hand in the first record book of the court, established this principle. The case was *Chisholm*, executor, against Georgia; and John Jay, the first Chief Justice, decided that a State could be sued the same as a corporation. This was considered the most ultra form of Federalist doctrine, and the States' rights people made such an ado about it that Congress hastened to adopt a constitutional amendment providing that "The judicial power of the United States shall not extend to suits against a State by a citizen of another State or a foreign State." That was in 1793. Ever since a State can be as dishonest toward individuals as she pleases, while holding them to strict accountability in their dealings with her. The question of State accountability is shortly to come up in a new form. Certain citizens of New Hampshire, holding repudiated bonds of Louisiana, have transferred them to their own State, and New Hampshire has brought suit upon them before

the Supreme Court. If the court holds the transfer to be valid and gives judgment against Louisiana, then the way will be open for all the defrauded creditors of defaulting States to get their money.

Still another class of business where the court has original jurisdiction is habeas corpus cases, affecting persons in jail by the operation of United States laws. Applications for habeas corpus writs may be made directly to any justice of the Supreme Court, but generally a Circuit judge is first applied to. If he remands the prisoner, then the case can be taken before the Supreme Court, and a writ of certiorari brings up the record of the proceedings in the inferior tribunal. A fourth and last class of original business is applications for what are called writs of prohibition. If an inferior court is believed to be going beyond its powers and jurisdiction, the Supreme Court may be applied to for a writ ordering it to stop proceedings. It is a curious fact, and one showing how carefully courts in this country keep within their proper sphere of action, that no such writ has ever been granted. There have been a few applications, but in no case was there shown to be sufficient ground for the interference of the supreme judicial power.

A very large majority of the cases tried before the Supreme Court come under its appellate powers. Cases decided by State courts of last resort, which involve what are called federal questions, that is, questions arising under United States statutes or treaties, may be taken to the Supreme Court on writs of error. The method is to file a petition alleging that a federal question is involved in the case. If the highest State tribunal refuses to grant the writ, any justice of the Supreme Court has the power to do so. It is said that the Virginia courts never assent to the transfer of cases to the Supreme Court on any showing whatever—holding the State judiciary to be equal to the Federal judiciary, and not subject to review. The interference of the Supreme Court is therefore necessary in all cases where writs of error are demanded in that commonwealth. When a writ of error is issued, it is signed by one of the justices and sent to the clerk of the State court, who makes up a full transcript of the record of proceedings in that court and all inferior tribunals through which the case has gone, including pleadings, testimony, and such evidence as is necessary, and sends them to the Clerk of the Supreme Court. A citation is served upon the “defendant in error,” who is, of course, the party that won the suit in the State courts; the “plaintiff in error” must file a bond to indemnify the defendant for any

damage he may suffer by the delay caused by the appeal, in case it is shown that there is no federal question involved. A member of the Supreme Court bar appears for the appellant, and the case is then docketed to await its turn. Writ of error cases also come up from the Circuit courts of the United States.

Much the largest class of cases decided by the Supreme Court come up from the lower Federal tribunals. Any one can appeal his case from a Circuit court to the tribunal of last resort, provided the sum involved exceeds five thousand dollars. This right of appeal is absolute, and does not depend upon consent of the Supreme Court, as in writs of error to State courts. It extends also to the Federal District Courts of West Virginia and Mississippi, which, by special statute, have Circuit court powers; and a statute applicable only to California permits special land cases to skip the Circuit Court and come directly to Washington from the District Court of that State. An application for an appeal is made to the judge of the lower court, and a single paper signed by him is all the formality required. The counsel for the appellant has the record made out and sent to Washington, and the case goes at once upon the docket. Thus, the only limit to the power of the litigants in the Federal courts to carry their disputes up to the highest tribunal in the country is a money limit. It costs very little to get a case tried, except for counsel fees. All the Supreme Court expenses amount to only about twenty dollars for each side, besides the cost of the record, which is taxed at the rate of twenty cents per hundred words. Justice, as administered by the Supreme Court, is cheaper than in many inferior tribunals, and is made expensive only by the bills of the lawyers, who often, no doubt, make clients believe that to present a case to that august bench of judges is so serious, exacting, and solemn an affair, that their services can be compensated for only by a large fee. The fact is that, in most cases, the point at issue is so narrowed down by the time it comes up before the court, that a few minutes’ direct common-sense talk in explanation of a brief is all that a wise lawyer attempts in making an argument, and all that the court will listen to patiently. The court is a bad place for a pretentious display of legal learning, or a flourish of oratory. The most successful advocates who practice at its bar are those whose style is most condensed and lucid, and who never travel away from the essential matter in controversy. They no doubt remember the anecdote of Chief-Justice Marshall—an anecdote, by the way, which has been tacked on to many eminent judges, but which Marshall’s

THE SUPREME COURT

biographers claim as belonging to him. A pompous and tedious advocate was rehearsing well-known and undisputed rules of law, when the Chief-Justice interrupted him, and said, "Mr. C., I think this is unnecessary. There are some things which a court, constituted as this is, may be presumed to know."

Not always, even in recent times, however, have the lawyers confined their speeches to the clarified common sense and direct logic which judges like to hear. Now and then the court is forced to listen to flights of rhetoric which bring half-amused and half-impatient looks to the faces of the justices. Here, for example, is a specimen of florid eloquence with which, not many years ago, a lawyer opened his brief in an important writ of error case. The brief is still shown as a curiosity in the office of the clerk of the court:

"May it please the Court: When the 'bonnie blue flag' went down before the 'star-spangled banner,' and that glorious emblem of 'the Union, the Constitution and the Enforcement of the Laws,' again waved in triumph

'From Maine's dark pines and crags of snow  
To where magnolian breezes blow,'

it was fondly hoped that civil strife and contention were at an end, and that peace, quiet, and repose had returned to bless the land.

"But these were

'Hopes which but allured to fly;'

they were, indeed, but

'Joys that vanished whilst we sipp'd.'

WAITE (CHIEF-JUSTICE).  
THE PRESENT JUSTICES

IN SESSION.

"For scarcely had the roar of artillery ceased and the smoke of battle cleared off, and scarcely had the ink become dry on the parchments of pardon which fell from the executive hand,

'Thick as autumnal leaves that strew the brooks  
In Vallombrosa,'

before some

'Of the last few, who, vainly brave,'

and who would theoretically, merely,

'Die for the cause they could not save,'

rushed into the courts, renewed the contest in another form, and we are here to-day on a writ of error to the Supreme Court of Louisiana, to reverse a victory obtained in

this new mode of hostility and attack upon the power and authority of the United States, and the rights of one which are firmly based upon the same."

We have already glanced at the marble busts of former chief-justices which look down from the walls of the Supreme Court room. One of them, Rutledge, held the office only during a recess of Congress, and was never confirmed by the Senate; so his term was limited to a single session of the court. There was a seventh, William Cushing, of Massachusetts, who was promoted from an associate-justiceship to be chief-justice, and was duly confirmed, but resigned before holding a term of the court. It may fairly be asked whether Cushing is not as much entitled to a place among the chief-justices as Rutledge, whose title to the office was never completed.

SEAL.

The first of the chief-justices was John Jay, of New York, who came to the bench when the court was first organized, after a remarkable career in the politics, legislation, and diplomacy of the revolutionary period. He was only forty-four when Washington placed him at the head of the Federal judiciary. The first congress under the constitution met in the spring of 1789, the House getting a quorum April 1st and the Senate April 6th, and the President coming up to New York on the 23d, in a barge rowed by thirteen pilots in white jackets. Congress was very slow in passing the necessary measures to set the new government in operation, and it was not until September 24th that the judiciary bill was adopted. It created District and Circuit courts, and a Supreme Court to consist of a chief-justice and five associate-justices. Washington had previously offered Jay a choice of offices under the Government, and Jay selected the chief-justiceship as most in accordance with his tastes. He was nominated September 26th, 1789, and his associates were: William Cushing, of Massachusetts, James Wilson, of Pennsylvania, John Blair, of Virginia, Robert A. Harrison, of Maryland, and James Iredell, of North Carolina. The court did not meet until February, 1790, when three of the justices assembled in New York, only to find that there was no business for them to transact.

At the next sitting, the following day, Justice Blair was present, and the letters-patent, as official commissions were then called, appointing the members of the court, were "openly read and published in court." No other business was done, save to appoint Richard Wenman crier. On the third it was ordered "that John Tucker, Esq., of Boston, be the clerk of this court, that he reside and keep his office at the seat of the National Government, and that he do not practice either as an attorney or a counsellor in this court while he shall continue to be clerk of the same." A seal was adopted, consisting of the "arms of the United States, engraven on a circular piece of steel of the size of a dollar, with these words on the margin, 'Seal of the Supreme Court of the United States.'"

There was a court now, with officers and a seal, but there was no bar. On the fifth of February, the minutes show that Elias Boudinot, of New Jersey, Thomas Hartley, of Pennsylvania, and Richard Harrison, of New York, Esquires, were severally sworn as by law required, and admitted counsellors of the court, and a rule was made that "it shall be requisite to the admission of attorneys or counsellors to practice in this court, that they

shall have been such for three years past in the Supreme Courts of the State to which they respectively belong, and that their private and professional character shall appear to be fair." Thus the beginning of a bar was made, and afterward the lawyers came in fast enough. Three days later eleven were admitted, among them Fisher Ames and Robert Morris. The English distinction between counsellors and attorneys was observed, and the two classes are carefully separated upon the records of the court.

On the third of March the court was reinforced by the arrival of James Iredell, so that there were four associate-justices sitting with Chief-Justice Jay. The fifth associate, John Rutledge, of South Carolina, did not attend this or any subsequent sessions of the court until he took his seat as Chief-Justice after the resignation of Jay.

The court was now fully equipped with a bench, a numerous bar, and a set of rules, but there were no cases to try. On the tenth of February it adjourned until the second of August. The justices went off to attend the Circuit Courts. When they re-assembled there was still no business beyond the admission of more counsellors and attorneys, and providing seals for the Circuit Courts; so another adjournment was had until the seventh of February, 1791. The Government, meanwhile, had left New York and gone to Philadelphia, and the court followed it. Still there was nothing to do beyond directing special terms of the Circuit Court to be held in New York and Philadelphia, to try persons accused of smuggling and other crimes against the federal laws. The first case that came before the Supreme Court is entered on the minutes as "*Nicholas and Jacob Vanstaphorst vs. State of Maryland*," and the first arguments of counsel which the court heard were on the question of the validity of a writ of error from the Circuit Court for the Rhode Island district. William Bradford, Attorney-General of Pennsylvania, made the argument for the plaintiff, and David L. Barnes for the defendant. The first opinions read were in the case of the State of Georgia *vs. Brailsford et al.*, and it is interesting to note that there was a division among the judges at the very threshold of their new duties. The case came up on a bill in equity, filed by Edward Telfair, Governor of Georgia, against Samuel Brailsford and three others, and it involved the sum of £7058 9s. 5d., which one James Spalding owed the defendants. Spalding was a tory, and his estate had been confiscated by the State. Brailsford was a British subject. In some way, Spalding had saved a portion of his property from the clutches of

the authorities, and long after the war closed his British creditors sued him and recovered judgment in the Circuit Court. His property had been sold by the marshal to satisfy the judgment, when the State stepped in and

subsequently the court found very little business to transact. In 1801, when John Marshall was appointed Chief-Justice, the number of cases awaiting adjudication was only ten, and during the five following years

OLIVER ELLSWORTH AND WIFE. (AFTER THE PAINTING BY R. EARLE, 1792.)

demanded the money. The injunction asked was to prevent the marshal from paying over the money to the creditors before the question of the right of Georgia to it could be judicially decided. Chief-Justice Jay, and Justices Iredell, Blair, and Wilson, read opinions in favor of granting the injunction, and Justices Johnson and Cushing in opposition.

It is noticeable that nearly all the early cases are suits against States by citizens of other States, which were all disposed of by the Eleventh Amendment to the Constitution, adopted in 1798, after Chief-Justice Jay's decision in the suit of Chisholm against Georgia, holding such cases to come within the jurisdiction of the courts, had stirred up Congress to protect the theory of State sovereignty and immunity from having their acts questioned by individuals. For several years

the average was only twenty-four a year. In the period between 1826 and 1830, the aggregated number of cases was two hundred and eighty-nine, or an average of fifty-eight a year. When Taney succeeded Marshall as Chief-Justice in 1836, the number on the docket was only thirty-seven. During the next twenty years the increase was gradual. From 1850 to 1855 the average was seventy-one a year, and the court was able to dispose of its docket by working three months. Of late the increase has been very rapid. From 1875 to 1880 the average number of new cases per year was three hundred and ninety-one, and over one thousand cases are now on the docket awaiting a hearing.

There are probably few lawyers, even, if asked whether a jury trial could be held in the Supreme Court, who would answer in the

affirmative. Yet there were once juries empaneled in that tribunal and cases tried before them, and there is nothing in the statutes now operative to prevent such trials in cases where the court has original jurisdiction, and in which questions of fact are involved. For example, in a case of a foreign minister suing a citizen for debt, either party would have the right to demand a jury. In the early history of the court, juries were regularly empaneled, just as in inferior tribunals, to be ready for duty if their services were needed. The first mention of a jury in the oldest volume of minutes is under date of February 4, 1794. The court then sat in the City Hall, in Philadelphia, and the case tried was that of the State of Georgia against Samuel Brailsford. I have not been able to find the record of the last jury trial, and the information cannot be had from any of the present judges or the traditions of the court. Probably it was before the chief-justiceship of Marshall. The custom is supposed to have fallen into disuse soon after suits of individuals against States were barred by the XIth Amendment. No lawyer would now desire to submit a question of fact to a jury when he could have the verdict of a bench of nine eminent judges, unless, indeed, he hoped to gain his case by throwing dust in the eyes of justice,—a proceeding which it would be hazardous to attempt in the Supreme Court.

Chief-Justice Jay sat upon the supreme bench until 1794, when he went to England, to negotiate the treaty which is known in history by his name, and which made a great disturbance in the politics of the time. On his return in 1795 he resigned, to accept the governorship of New York, to which he had been elected during his absence. Ardent Federalist as he was, the governorship of a great State seemed to him a more exalted office than the Chief-justiceship of the United States. The Federal Government was new and untried, and its powers were hardly recognized or understood. He had been overruled by Congress in his attempt in the *Chisholm* case to destroy, in its incipency, the theory of State's rights, by treating the States as mere corporations, which could be brought to book before the Federal judiciary, and he threw off the judicial robe gladly to take the helm of his own State, which he had served conspicuously and well during the stormy epoch of the war. He died in 1829, after several years of tranquil retirement upon his estate in Westchester County. A friend, observing the substantial nature of his buildings, and knowing his religious views, once remarked that Governor Jay, in all his conduct, seemed to have reference to perpetuity in this world and eternity in the next. Jay was a little less than six feet high. He had a color-

less complexion, blue eyes, an aquiline nose, and wore his hair over his forehead and tied behind in a cue. He was gentle and unassuming in his manners, and had a vigorous, exact, logical mind. An Episcopalian in religion, he was an active churchman and a great Bible student. When on his estate, he rose with the sun, rode on horseback a great deal, was punctual and methodical in his habits, and never omitted to conduct family worship morning and evening. His face, as shown in the bust in the court-room, is one of strength rather than genius. The features have a classical regularity, and the head might well be taken for that of a Roman consul.

The second Chief-Justice was John Rutledge, of South Carolina, a typical Southern statesman, haughty, generous, impetuous, brave, and not always discreet. He, like Jay, had played a leading role in the Revolution. He had been a member of the first Continental Congress, then President of South Carolina from 1776 to 1778, Governor from 1778 to 1782, then a year in the first congress under the constitution. From Congress he went back to his State, served in its legislature, sat on the bench of the Equity Court, and was elected Chief-Justice of the Court of Common Pleas in 1791. Washington appointed him one of the Associate-Justices of the Supreme Court upon its first organization,—a position he seems not to have valued much, for he hesitated some time before resigning his place in the State judiciary, and did not attend the sessions of the Supreme Court in New York or its first meetings in Philadelphia. When Washington named him for Jay's place, in 1795, the friends of the Administration were surprised and offended. The struggles between the Federalists and the anti-Federalists—the strong-government men and the weak-government men—had already begun. Rutledge, although a personal friend of Washington, had identified himself with the anti-Federalist party. There was strong feeling at the time over the Jay treaty, in which the new republic sought the friendship of England and cut the ties of French sympathy. Rutledge belonged with Jefferson to the French party. The Federalists sharply criticised his appointment. Rutledge himself hastened to justify their assertions that Washington had made a serious mistake in selecting him for the chief-justiceship. He was in Charleston when the news of his appointment arrived. Almost at the same time came the details of Jay's treaty with England. Rutledge made a vigorous speech at a public meeting, denouncing the treaty, reckless of the fact that he was no longer a South Carolina poli-

SALMON P. CHASE. (FROM A PHOTOGRAPH BY BENDANN.)

tician, but the head of the Federal judiciary. It is said of Rutledge, by one of his biographers, that he exhibited every degree of courage, from that of a grenadier to that of a statesman. His speech on the Jay treaty was unquestionably courageous, but it showed only the grenadier type of courage, which cares nothing for consequences. It preceded him to the national capital, and added fresh fuel to the anger of the Administration party. "A driveler and a fool has been appointed to be Chief-Justice," exclaimed a member of Washington's cabinet. "Is faction to be courted at so great a sacrifice of consistency?" asked a Federalist senator. Congress was not in session when Rutledge reached Philadelphia, and he took his seat in the Chief-Justice's chair without waiting to be confirmed by the Senate. When Congress met, in December, the harsh feelings against him had subsided a great deal, and his friends had had time to

urge in his behalf his brilliant services to the cause of American liberty during the Revolution; but a disease from which he had long suffered had begun to affect his mental faculties, and it was evident that he would soon become unfitted to hold a judicial office. So he was rejected by the Senate. He returned to South Carolina with the bitter feeling that the nation he had done so much to create had put a stigma upon him. He died in 1800, a mental wreck. One of the biographical sketches of him contains a hint about the "follies of the wise and the frailties common to mankind," from which we may infer that bad habits had much to do with the premature decadence of Rutledge's powers. He was only sixty-one when he died,—an age at which most public men are in the full maturity of their faculties.

The bust of Rutledge in the Supreme Court chamber is that of a singularly handsome

THE LATE D. W. MIDDLETON, CLERK OF THE SUPREME COURT.  
(FROM A PHOTOGRAPH BY SPINNER.)

man, with symmetrical features, large, eloquent eyes, a delicate, pleasure-loving mouth, and a rounded, rather woman-like forehead. The nose alone shows evidence of force of character. The type of face is rather French than English.

Upon the refusal of the Senate to confirm Rutledge as chief-justice, President Washington sent in the name of William Cushing, of Massachusetts, an associate-justice of the court. Cushing was one of the most eminent jurists in the country, and came of a family of lawyers. He was born in Scituate, Massachusetts, in 1732, and shortly after his admission to the bar was made judge of probate. He may be said to have inherited his next promotion from his father, who was a judge of the Superior Court in the colony, for, upon the father's death, the son was at once appointed to the vacancy. In 1775 he became Chief-Justice of Massachusetts, an office he held for fourteen years, when he was selected by Washington as one of the Associate-Justices of the Federal Supreme Court on its organization. He attended the first meeting in New York, and his name is rarely absent from the records of the subsequent sessions in New York and Philadelphia. The notification of his promotion to the chief-justiceship came to him in a singular way. The day the appointment was signed, Washington gave a dinner-party, and Cushing was one of the invited guests. Arriving rather late, he found the President and the other guests already at table. The place of honor at Washington's right hand was vacant. When Cushing entered, Washington said in a clear, emphatic tone: "The Chief-Justice of the United States will please take a seat at my right hand." Cushing, who had not expected the

promotion, was deeply affected by the announcement and the congratulations which followed. The Senate promptly confirmed him by a unanimous vote. He held his commission only a week, and then resigned, in spite of the efforts of Washington to dissuade him. He had presided over the court during Jay's absence in Europe, but, as he never sat as chief-justice, his name is often omitted from the list of those who have held the office. He remained upon the bench as associate-justice until his death in 1810.

Cushing was of good stature, erect, graceful, and dignified. He had a fair complexion, brilliant blue eyes, and an aquiline nose. He adhered to the Revolutionary style of dress after it had generally been abandoned, wearing a cocked hat, knee-breeches, silk stockings, and low shoes with big buckles, to the day of his death. He was a good conversationalist, social, cheerful, kind, very tender of private character, greatly beloved by his family and friends, and had the rare and admirable trait of always looking on the best side of human nature.

Washington's third choice for Jay's vacant chair fell upon Oliver Ellsworth, then a senator from Connecticut, and one of the foremost statesmen of the time. Born in Windham, Connecticut, in 1745, Ellsworth was educated by his father for the ministry. He studied at Yale, and later at Princeton, and then read theology with Dr. Smalley, a clergyman of considerable reputation in New England. All this study only developed in the young man a distaste for the ministry, and, in spite of the remonstrances of his father, he left the great doctor of divinity and began to fit himself for the bar. As soon as he was admitted to practice, and before he had earned a single fee, he took to himself a wife. Possessed of an indomitable will, and of a gift of vigorous, practical oratory, he had not long to wait for success in either politics or law. We see him soon in the Connecticut Assembly as an ardent patriot, then in the Continental Congress, then back in his own State as a judge of her Supreme Court. He was a member of the convention that framed the Federal Constitution, and on the organization of the new government was chosen one of the Connecticut senators, leaving the Senate for the Chief-Justice's chair in 1796. Very little business came before the court when Ellsworth was upon the bench. The questions which afterward tested the strength and endurance of the federal system had not ripened. It may be said, however, that though an ardent State's rights man while in the Senate, like most of the Connecticut politicians of that day, he took an enlarged view of the powers of the

General Government while he sat upon the supreme bench, and his opinions were in line with the patriotic sentiment of nationality which had begun to combat the narrow and selfish provincialism that characterized the utterances of many of the public men of the time. In 1799, President Adams, on the rec-

John Marshall, of Virginia, who succeeded Ellsworth, is rightly called the great Chief-Justice. It was he who established the power of the Supreme Court as we recognize it at the present day. It was he who, more than any other man of his time, carried forward the work of the constitution in welding the

A CORNER IN THE LAW LIBRARY.

ommendation of a Senate committee, sent a commission to France to negotiate a treaty. Oliver Ellsworth, Patrick Henry, and William Vans Murray were the commissioners. Upon his return in 1801, the Chief-Justice resigned his seat upon the bench and retired to his farm in Windsor, Connecticut. He consented to serve for a short time as a member of the Governor's Council, but declined the chief-justiceship of the State in 1807. In November of that year he died. Trumbull's portrait of Ellsworth is regarded as an accurate likeness. His features were singularly rugged and strong. So angular do they appear in the marble bust in the Supreme Court room, that one might almost suppose the sculptor had only rough-hewn the face, and had failed to round off the square forehead and the projecting nose and chin. Ellsworth was not accounted a man of genius. It was said of him that he did not descend to his subject from above, but rose to it by regular gradations of logic. His habits of thought were slow and laborious. He read few books, had little sense of the beautiful, and not much creative power. Nature, says his biographer, formed him for the discharge of active duties rather than for contemplative studies.

loose league of States into a compact, powerful nationality. It was he who smothered, for nearly half a century, the dangerous doctrine of State sovereignty, which, a quarter of a century after his death, convulsed the country with civil war. Marshall was born in Fauquier County, Virginia, in 1755, and grew up on a farm. In his youth he studied Latin with a Scotch clergyman, and read law. When the Revolution broke out he enlisted in a militia company, and soon afterward was commissioned lieutenant in the Eleventh Virginia Infantry. The young soldier fought bravely at the battles of Germantown, Brandywine, and Monmouth, and took part in the storming of Stony Point. When the war ended, he went back to his law-studies, was soon admitted to the bar, and began to practice in the local courts. Tall, gaunt, awkward, and ill-dressed, he made a striking figure among the fine gentlemen of the Virginia towns; but his talents were conspicuous, and he rose rapidly in his profession by his remarkable power of seizing the attention, extracting at once the kernel of a question, and producing conviction in the minds of his hearers. When he first appeared in Richmond to argue a case, he sauntered about the

JOHN G. NICOLAY, MARSHAL OF THE SUPREME COURT. (FROM A PHOTOGRAPH BY BRADY.)

streets in a plain linen roundabout, looking like a slouchy country bumpkin; but once in court, he astonished the judge and the bar by his wonderful powers of analysis. William Wirt said he had an almost supernatural faculty of developing a subject by a single glance of his mind, and detecting the very point upon which every controversy depends. He comprehended the whole ground at once, and wasted no time on unessential features. "All his eloquence," said Wirt, "consisted in the earnestness of his manner, the close connection of his thought, and the easy gradations by which he opens his lights upon the attentive minds of his hearers."

Entering public life, Marshall became a member of the Virginia Legislature and of the convention which framed the State Constitution. He was sent to France as a special envoy in 1797, and returned in 1798, and was elected to Congress the next year. He delivered a eulogy on Washington which attracted universal attention. In 1800 he became Secretary of State in the Cabinet of John Adams, and in 1801 was appointed chief-justice. We are indebted to his biographer, Judge Story, who sat upon the Supreme Bench with him for twenty-four years, for more than one striking description of his person and character. "His body," wrote Story, "seemed as ill as his mind was well compacted; he was not only without proportion, but of members sin-

gularly knit, that dangled from each other and looked half dislocated. Habitually he dressed very carelessly in the garb, but I would not dare to say in the mode, of the last century. You would have thought he had on the old clothes of a former generation, not made for him by even some superannuated tailor of that period, but gotten from the wardrobe of some antiquated slop-shop of second-hand raiment. Shapeless as he was, he would probably have defied all fitting by whatever skill of the shears; judge, then, how the vestments of an age when apparently coats and breeches were cut for nobody in particular, and waistcoats were almost dressing-gowns, sat upon upon him." In another description Story says Marshall's hair was black, his eyes small and twinkling, his forehead rather low, but his features generally harmonious; and speaks of an occasional embarrassment in his speech, form a hesitancy and drawling; of a laugh "too hearty for an intriguer," and of his good temper and unwearied patience on the bench and in the study. Harriet Martineau made the following effective little pen-sketch of a scene in the Supreme Court room when Marshall was delivering an opinion—the time 1835, when the great Chief-Justice was fourscore years of age, and within a few months of his death:

"At some moments the court presents a singular spectacle. I have watched the assemblage while the Chief-Justice was delivering a judgment, the three justices on either hand gazing at him more like learners than associates; Webster, standing firm as a rock, his large, deep-set eyes wide awake, his lips compressed, and his whole countenance in that intent stillness which instantly fills the eye of a stranger; Clay leaning against the desk in an attitude whose grace contrasts strangely with the slovenly make of his dress, his snuff-box for the moment unopened in his hand, his small gray eye and placid half-smile conveying an expression of pleasure which redeems his face from its usual unaccountable commonness; the Attorney-General (Benjamin F. Butler, of New York), his fingers playing among his papers, his quick, black eye and tremulous lips fixed, his small face, pale with thought, contrasting remarkably with the other two. These men, absorbed in what they are listening to, thinking neither of themselves nor of each other, while they are watched by the group of idlers and listeners around them,—the newspaper corps, the dark Cherokee chiefs, the stragglers from the West, the gay ladies in their waving plumes, and the members of either house that have stepped in to listen,—all these have I seen at one moment constitute one silent assembly, while the mild voice of the aged Chief-Justice sounded through the court."

If the reader wants to realize this scene, let him go down into the basement of the Capitol, to the low-vaulted room now occupied by the Law Library, imagine the book-cases removed, and the judges sitting just under the curious colored bas-relief on the wall, and fill in the picture by the aid of Miss Marti-

neau's description. There are two portraits of Marshall in the consultation room of the court,—one by Peale, which is charming as a work of art, but has so little *vraisemblance* that it might pass for almost anybody as well as the great jurist; the other is a rude affair, copied from a picture in the possession of Marshall's descendants, which is said to be a fair likeness, though an undeniable daub.

It is impossible, in the limits of this article, to give even a sketch of Marshall's work upon the bench. For the benefit of readers who are not lawyers, something may be said, however, about a few of his most important constitutional decisions sustaining the powers of the Federal Government and vindicating the authority of the Federal Judiciary over both State tribunals and State legislatures. The best-known of these decisions is probably that given in the Dartmouth College case, which broadly asserted the authority of the Supreme Court to annul State laws repugnant to the Constitution of the United States. The Legislature of New Hampshire had passed an act which invaded and practically annulled the charter of the college. The State courts affirmed the validity of the law, but the Supreme Court set it aside as a violation of the provision in the constitution prohibiting legislation impairing the validity of contracts. In the argument of the case Daniel Webster was one of the counsel for the college, and William Wirt for the State.

Another important case bearing upon the authority of the court was that of *Marbury* against Madison. *Marbury* had been appointed by President Adams a justice of the peace for the District of Columbia. The commission had been signed, but not delivered, when Jefferson succeeded Adams, and Madison, the new Secretary of State, refused to hand it over. *Marbury* sued for a writ to compel Madison to give it to him. The court held that it had no original jurisdiction in the case, and refused the writ; but Marshall gave an opinion that the District Court could issue the writ, and that the case could come up on an appeal. The principle established was that the court had jurisdiction over the executive branch of the Government to compel it to perform ministerial functions in accordance with law. This principle was affirmed later in Jackson's time, when the court issued a writ of mandamus to Amos Kendall, Postmaster-General, to compel him to pay a mail contractor.

Perhaps the most important of Marshall's political decisions was that in the case of *McCulloch* against Maryland, involving, as it did, a vital question relative to the powers of the State and General governments. In

reality, the suit was a dispute between Maryland and the United States. Each denied the constitutionality of a law of the other. A branch of the United States Bank had been established in Baltimore, and the Legislature of Maryland passed a law taxing it. The bank maintained that the law was repugnant to the constitutional powers of the General Government. The State attacked the constitutionality of the Bank Charter Act. Chief-Justice Marshall held that the question was one of absolute supremacy between the powers of Maryland and those of the General Government. If the States, he said, may tax one instrument employed by the Government in execution of its powers, they may tax any and every other instrument,—the mails, the mint, patent rights, and judicial processes,—to an excess which would defeat all the ends of the General Government. The American people, he declared, did not design to make their government dependent upon the States.

In the case of *Cohen* against the State of Virginia, Marshall decided that a writ of error would lie from the Supreme Court of Virginia to the Supreme Court of the United States, and that it was no valid objection to the jurisdiction of the latter tribunal that one of the parties was a sovereign State and the other a citizen of that State. Jefferson, speaking for the anti-Federalists, denounced this doctrine as extra-judicial, and in defiance of the Eleventh Amendment of the Constitution. The Chief-Justice amplified it in the case of *Martin* against *Hunter's Lessees*, deciding that the appellate jurisdiction of the Supreme Court extends to a final judgment of the highest court of a State, where the validity of a State law is drawn in question as being against the Constitution, treaties, or laws of the United States. These decisions have defined the jurisdiction and governed the action of the Supreme Court ever since.

Marshall died at his country-seat, in Fauquier County, Virginia, in 1835, during a recess of the court. Andrew Jackson was then President. He appointed to the vacant chief-justiceship his Attorney-General, Roger B. Taney, an able lawyer and an active Maryland politician of the then newly organized Democratic party. Taney was born in Calvert County, Maryland, in 1777, and after studying in Dickinson College and reading law in Annapolis, came to the bar in 1799. He served in both branches of the Maryland Legislature, was Attorney-General of the State, and in 1831 entered Jackson's Cabinet. Two years later the President, to whom Taney had rendered important political services, wanted to give him the Treasury portfolio,

but the Senate refused to confirm him. In January, 1835, Jackson nominated him as an associate-justice of the Supreme Court, but the Senate, still adverse, indefinitely postponed the nomination. Better fortune attended his appointment to the chief-justiceship, on the death of Marshall, in the same year; though strongly opposed by Clay and Webster, he was confirmed by a majority of fourteen votes. Taney sat for twenty-eight years in the chief-justice's chair. He was a jurist of remarkable ability, and would perhaps rank next to Marshall in the pages of history, as the second among the great intellects that have adorned the Supreme Bench, had he not by a single decision permanently obscured and for a season totally eclipsed the well-won fame of a life-time. Men whose memories of public events do not go back so far as 1857 can scarcely realize the depth of indignant feeling aroused in the Northern States by the *Dred Scott* decision, with which Taney's name will, unfortunately for his reputation, be chiefly and almost exclusively identified. *Dred Scott* was a negro belonging to an army officer, who had taken him into a Free State. This act entitled the slave to his liberty, and when he was afterward taken back to Missouri, he sued for his freedom. The case was carried up to the Supreme Court, and Taney, speaking for the majority of its members decided that persons of African blood were never spoken of or thought of except as property when the Constitution was formed, and were not referred to by the Declaration of Independence, which says that all men are created free and equal, and entitled to life, liberty, and the pursuit of happiness. Such persons, Taney declared, had no status as citizens, and could not sue in any court; and he asserted as a historical fact that, at and prior to the Declaration of Independence, negroes were regarded as "so far inferior that they had no rights a white man was bound to respect." This decision shocked the humanity of the civilized world. It marks in history the culmination of the slave power in America. After it was delivered the growth of the Anti-Slavery party, already well advanced, was rapid. Three years later the resistance of the North to the insolent encroachments of the "accursed institution" led the South to seal its doom by open rebellion. Taney was a slaveholder, but was one of the kindest and most generous of masters. His cruel decision proceeded from no hardness of heart, but was purely the result of his political bias and the honest outcome of his logical processes of reasoning. Grant the legal and historical premises upon which he bases it, and the conclusions he draws are inevitable.

There was no sadder figure to be seen in Washington during the years of the war than that of the aged Chief-Justice. His form was bent by the weight of years, and his thin, nervous, and deeply furrowed face, shaded by long, gray locks, and lighted up by large, melancholy eyes that looked wearily out from under shaggy brows, gave him a weird, wizard-like expression. He had outlived his epoch, and was shunned and hated by the men of the new time of storm and struggle for the principles of freedom and nationality. He did his duty faithfully to the last, however, in all the hard routine work of the court. Death came to his relief in 1864. The harsh judgment formed of him has been largely modified by time, and his character as an upright and able judge, a pure-minded man, and a devoted father and friend, begins to be recognized. He died poor, and one of his daughters now supports herself by the work of a Government office in Washington. For several years after his death, Taney's bust was excluded from its place among the chief-justices on the wall of the court-room. It stood in a sort of limbo, in a niche in one of the passages near the Senate chamber, and Charles Sumner watched every appropriation bill to prevent an item being included to authorize its purchase. When Sumner died, there was no further opposition to paying for it and giving it its proper place.

Salmon P. Chase, the recent Chief-Justice, will live in history, not so much as a jurist, but as one of the small band of eminent statesmen and philanthropists who took the agitation against human slavery into the field of practical politics and there guided it forward to its complete triumph in universal liberty and equal suffrage and citizenship. Born in Cornish, New Hampshire, in 1808, he went to Ohio as a boy, gained an education by hard work and self-denial, and rose from a position of poverty and manual labor by the force of intellect and character. He was admitted to the bar of the District of Columbia in 1829, and entered the mingled career of law and politics which most ambitious lawyers followed at that time. The law was soon laid aside for the duties of public life, but not until he had distinguished himself by his arguments in important cases. He served in the United States Senate from 1849 to 1855, and was Governor of Ohio from 1855 to 1857. Belonging first to the Democratic party, he was the leader of its anti-slavery element until the rise of the Republican party, of which he was one of the original organizers and most conspicuous chiefs. A leading candidate for the Presidential nomination in 1860, he was invited by his successful competitor, Mr.

Lincoln, into the first Republican Cabinet in 1861, and left the Senate, to which he had just been chosen for the term of six years. As Secretary of the Treasury he performed the stupendous task of supplying the Government with money to carry on the war. To him were largely due the financial measures which brought the means of support to the armies of the Union, and made the suppression of the rebellion possible. The bond and legal tender acts, and the National Bank system, were in great part his creations. On the death of Taney, President Lincoln appointed Mr. Chase Chief-Justice. Like his two predecessors, he had never sat upon the bench of any court when he put on the black robes of the highest judicial station in the country, and, unlike them, he had acquired no special eminence at the bar. Indeed, he had practiced very little since his younger days. He possessed, however, invaluable qualifications for his new position in his thorough knowledge of our system of government, in its principles and in all its operations; in a strong, well-balanced and philosophic mind, and in a calm, judicial temper. His service upon the Supreme Bench, cut short by his untimely death in 1873, at the age of sixty-five, was a fitting conclusion to a life spent in dealing with the larger affairs of state. His opinions were clear and vigorous, and bore the stamp of a strong, original mind. Such of them as touched political questions were in line with the principles of equal rights and supreme national authority which the war firmly established. The Dred Scott decision was set aside in a way which, though indirect, was effective and peculiarly appropriate. In pursuance of an understanding between the Chief-Justice and Senator Sumner, the latter appeared in court, on February 1, 1865, accompanied by a colored man, and said: "May it please the Court, I present John S. Rock, a member of the bar of the State of Massachusetts, and move that he be admitted as a counsellor of this court." The Chief-Justice bowed, and said: "Let him come forward and take the oath." Mr. Rock was then sworn, in the usual form, at the clerk's desk. Mr. Chase was tall in stature, and of large and muscular form. His eyes were blue, his complexion was fair, his forehead was broad and high, his features were regular, his expression was singularly winning, and his manners were agreeable and graceful. There have been few better types of the highest range of American statesmanship.

Chief-Justice Chase was succeeded by Morrison R. Waite, of Ohio, who was appointed by President Grant in 1874. Mr. Waite was born in Lyme, Connecticut, in 1816, was

graduated at Yale College in 1837, and soon after went to Ohio. He gained a prominent position at the bar of that State, was one of the Government counsel at the arbitration of the Alabama claims at Geneva, and was occupying the chair of the Constitutional Convention of Ohio when informed of his appointment as chief-justice. It is not within the scope of this article to speak of his work on the bench, or of that of any of the justices now living. An exception must be made, however, in order to complete the record of the main political decisions of the court. What are known as the Louisiana Slaughter-house cases were decided during the chief-justiceship of Mr. Chase, and against his judgment, the opinion of the majority of the court being delivered by Justice Miller. This decision exercised a powerful political influence in checking the tendency to consolidate power in the Federal Government and to deprive the States of their right to regulate their local affairs. It put a stop to the idea which had inspired much of the recent action of the dominant party, that the amendments to the constitution adopted after the war were intended to be a total reconstruction of the Constitution on the principle that the federal power was omnipotent on every subject it chose to act upon, and restored the just and harmonious equilibrium of the dual system of State and national authority. A great deal of feeling was aroused in Congress by this decision, but it has since been generally acquiesced in; and if the court, which was then nearly equally divided upon the question, were to pass upon it now, it would probably be unanimous. Another important decision of the same period should also be mentioned. The court in 1870 had held the legal tender act to be unconstitutional so far as it applied to contracts made before its passage. Two new justices, Mr. Bradley and Mr. Strong, were appointed in pursuance of an act of Congress, restoring the former numerical strength of the bench. The case was re-argued, and the previous decision reversed by their votes. Lawyers still differ as to the correctness of this last decision.

In 1877 the court was called upon to furnish five of its members to a unique mixed commission created to settle a disputed title to the Presidency. This body, called the Electoral Commission, was composed, besides the five justices, of five senators and five representatives. It sat in the Supreme Court room, heard arguments on the question of accepting or rejecting the electoral votes of States about which the two houses of Congress had disagreed, and reached decisions by a majority vote of its members. The members of the court who belonged to it were

Justices Clifford, Field, Bradley, Miller, and Strong. Justice Clifford presided. In all test-votes the decision was so close that the vote of one justice, Mr. Bradley, was decisive. The practical result of the commission was that the vote of Justice Bradley made Ruth-erford B. Hayes President of the United States, and rejected the claim of Samuel J. Tilden. One of the members of the commission was the late President Garfield, then a Representative, whose seat was just beyond that now occupied by Justice Blatchford.

The organization of the Supreme Court has more than once been changed. Originally consisting of a chief-justice and five associate-justices, as we have seen, it was enlarged in 1807 by the addition of a sixth associate. The States of Ohio, Kentucky, and Tennessee had come into the Union, and were made into a new circuit, represented on the bench by Thomas Todd, of Tennessee. In 1837 two more justices were added by law, the new appointees being John Catron, of Tennessee, and John McKinley, of Alabama. In 1863 a ninth associate justice was added, to give the Pacific coast a representative. This was thought to be good political policy at a time when the Union was in the throes of rebellion; and besides, the court needed the assistance of a judge who was familiar with the peculiar land system of California, inherited from the Mexican and Spanish *régimes*. Stephen J. Field, of California, was the appointee. When Justice Catron died, in 1865, Congress was in the midst of its long, serious struggle with President Johnson, a struggle which ended in the practical subversion of the Constitution by depriving the President of important functions of executive power, and reducing him in real authority below the level of his cabinet ministers. To prevent the appointment to the Supreme Bench of Democrats in sympathy with Johnson's Southern policy, a law was passed over the President's veto, forbidding the filling of the existing vacancy, or of any future vacancy, until the number of associate-justices should be reduced to six. The death of Justice Wayne in 1867 reduced the number to seven. In 1869 a new law increased the number to eight, and President Grant appointed Justices Strong and Bradley.

In all there have been seven chief-justices and forty-three associate justices—a small number for a period now almost spanning a century. John Marshall and Joseph Story each served thirty-four years. James M. Wayne and John McLean each served thirty-two. The next longest term was that of Bushrod Washington, a nephew of George Washington and the heir of Mount Vernon,

who sat for thirty-one years. William Johnson was thirty years on the bench. Roger B. Taney twenty-eight, John Catron twenty-eight, and Samuel Nelson twenty-seven. There have been but seven clerks of the court, and the first two resigned after brief service. Practically the court has had but three clerks before the present incumbent. Of these three, lawyers will kindly remember the amiable character and never-failing courtesy of Mr. D. W. Middleton, who died in 1880, after having been connected with the office fifty-five years, and at its head for seventeen. In announcing his death, the Chief-Justice said :

"His handwriting first appears on the records of the court under date of the 7th of February, A. D. 1825. From that date until his death he was, without interruption, actively engaged in the business of the office to which his successor has just been appointed, and even a whisper of complaint against him in any particular has never reached our ears. Three chief-justices of the court and eighteen associate-justices have died since his service began. He was a most accomplished officer, courteous in manner, dignified in deportment, faithful in every duty, and never unmindful of the confidential relations he had with the court."

The present clerk is James H. McKenney. Formerly, the Marshal of the District of Columbia acted as executive officer of the court, but in Chief-Justice Chase's time the marshalship was made a distinct office. It has had but two occupants: Richard C. Parsons, of Ohio, and John G. Nicolay, of Illinois. An excellent civil service system prevails among the minor employees, some of whom are the sons and grandsons of former clerks and messengers. The strife for office, which is one of the great evils of public life in this country, has never invaded the precincts of the Supreme Court.

Formerly the service of an occupant of the Supreme Bench was terminated only by death or resignation; but in 1869 a law was passed permitting any justice to retire, with full pay, when seventy years of age, provided he has served ten years. Three retired justices, Swayne, Strong, and Hunt, are now living.

The federal judiciary system divides the country into sixty districts. There are fifty-three district judges, a few having more than one district to look after. The districts are consolidated into nine circuits, for each of which there is a circuit judge. In each circuit a Supreme Court justice is also assigned, whose duty it is to attend the sittings of the Circuit court as often as once in two years. Before 1869 there were no circuit judges, and the circuit duty of the members of the Supreme Court was much more onerous. Probably they will be relieved of it altogether before long, for their duties upon the Supreme Bench have become so onerous that numerous measures have been recently urged in Congress for their re-

lief, and for the advantage of litigants, whose cases are usually delayed two or three years by reason of the great length of the docket.

One of the plans recently presented in Congress for the relief of the court, provides for an increase in its membership, and the division of the tribunal into branches, each branch to be charged with the hearing of a certain class of cases, as, for instance, patent cases, admiralty cases, and so forth, and the full bench to consider only a limited range of cases of great importance. Some doubt has been expressed as to the constitutionality of this plan, on the ground that a part of the court could not be held to be the Supreme Court within the meaning of the Constitution.

Another plan is to interpose between the Circuit courts and the Supreme courts a new

tribunal, to serve as a sort of dam to stay the flood of business pressing forward to the Supreme Bench. This new tribunal, it is proposed, shall have power of final decision to such an extent as to relieve the Supreme Court of a large share of the business now coming before it.

Still a third plan is to establish a high limit of the amount involved in cases that can be brought to the Supreme Court on appeal. This latter plan appears to be the one most favored by the members of the court. They do not, as far as can be learned, approve of the division of the court into a number of subordinate tribunals, nor do they appear to think it wise to limit the class of controversies in which litigants have the right to demand a decision from the tribunal of last resort.

#### INVITA MINERVA.

THE muses ring my bell and run away.  
 I spy you, rogues, behind the evergreen.  
 You, wanton Thalia, romper in the hay;  
 And you, Terpsichore, long-legged quean.  
 When I was young you used to come and stay,  
 But, now that I grow older, 'tis well seen  
 What tricks ye put upon me. Well-a-day!  
 How many a summer evening have ye been  
 Sitting about my door-step, fain to sing  
 And tell old tales, while through the fragrant dark  
 Burned the large planets, throbbled the brooding sound  
 Of crickets and the tree-toads' ceaseless ring;  
 And in the meads the fire-fly lit his spark  
 Where from my threshold sank the vale profound.

*Henry A. Beers.*

#### THE CHRISTIAN LEAGUE OF CONNECTICUT.

BY WASHINGTON GLADDEN.

V.

BEFORE the end of the summer vacation, the brass-works at New Albion were in operation, and a large colony of mechanics had occupied the tenement-houses of the "Patch" above the mill. For the use of this new community the town had provided a school-house; a neat hall above the company's store gave room for religious services. The mill was a mile and a half from the nearest church, and something must be done to supply the

religious wants of the new community. The question arose at the September meeting of the Christian League Club.

"What is to be done for the brass-workers?" asked Mr. Strong.

"I believe," answered Mr. Thorpe, blushing a little, "that our people have already taken steps toward organizing a church in that neighborhood."

"Indeed!" exclaimed Dr. Sampson. "The Baptists have also consulted me about services there, but I declined to express any

opinion until some conference had been held upon the matter by this club."

"I want it understood," answered Mr. Thorpe, "that I have done nothing about it. One of the overseers at the mill is a zealous Methodist, and he has found out that quite a number of the hands belong to our connection. The presiding elder was down there the other day, and conferred with him about it. But I felt as the Doctor did, that it would hardly be right for me to help in the enterprise until we had talked it over here."

"Would it not be well," asked Mr. Strong, "to call a public meeting in the hall at the brass-works, of all persons who desire the organization of a religious society, and let them determine for themselves what kind of an organization they will have."

"That is fair," was the verdict of several voices.

"Let us have a committee of seven,—one from each of the denominations represented in this club,—who shall call this preliminary meeting, and be present to take charge of its deliberations."

This was the suggestion of Mr. Peters.

"Good!" was the general response.

"And now," said Mr. Franklin, "I hope nobody will object to my proposition, which is that this committee consist of the pastors of these churches, omitting the pastor of the Second Church. The Congregationalists should not outnumber the others on the committee; and I am sure that the presence of these seven pastors at a meeting of this character will be to the brass-workers an impressive object-lesson in Christian unity."

"Mr. Franklin is exactly right," said Mr. Strong. "My absence will not be misinterpreted, and Dr. Phelps is competent to represent the Congregationalists."

The proposition was, therefore, unanimously agreed to, and a handbill, signed with the names of the seven pastors, called the people of the brass-works together on the next Sunday afternoon. The hall was filled with an interested company. Dr. Phelps, as the senior pastor, took the chair.

"We have called you together," he said in his brief opening speech, "because we assumed that there must be, among the six or seven hundred people of this new settlement, a large number who would desire some sort of religious organization, and because we, the pastors of the Protestant churches in New Albion, desired to assist you, if we could, in forming one. I know that I speak for all of my brethren when I say that none of us cares so much to have a church of his own particular sort formed here, as to have the people here happy in their church relations. We have

learned, in New Albion, to dwell together in unity, and we want you to live in the same way. Whatever kind of church is formed here, if it be only a church that owns and follows Jesus Christ, it will receive the right hand of fellowship from every one of our churches. It is evident that there ought not to be more than one church in this small community; we have come to assist you in deciding what form that organization shall take. I understand that some steps have been taken toward forming a Methodist church here. We shall have no objection whatever if the society takes that form, if that is the wish of the community; we only care that you should be heartily agreed among yourselves, and work together harmoniously."

Three or four of the other pastors followed with short speeches, each of whom testified, with equal clearness, to the desire of all for unity and coöperation among the Christians at the brass-works.

"And now," said Dr. Phelps, "we propose to submit this matter to the decision of those interested. Those who wish to have a religious society organized in this place, and who will pledge themselves to assist in supporting it, either by contributions, by Christian work, or by attendance upon its services, will please rise."

About fifty men and women stood up.

"Very good! Now, for convenience, will those who have thus pledged themselves occupy the seats in the right-hand corner of the hall."

The audience, like most audiences, was a little reluctant to make this change of seats, but it was at length accomplished, and the corner was occupied by a respectable-looking company, of which one-third were men.

"We shall now," said Dr. Phelps, "distribute among you slips of paper on which you are requested to write the name of the denomination in accordance with whose rules you wish this society to be organized; if you want a Methodist church, write 'Methodist;' express your preference on your ballots."

"If you please, sir," said a stout, ruddy-faced young Englishman, standing up in the right-hand corner, "I have just come over from the old country, and I know but little about your churches here; in England I went to chapel; but I like what I have heard this afternoon, and I wish that the new church might be the same kind that these gentlemen belongs to that has come down here to help us organize, if you will tell me the name of it."

There was a little laugh; but the Englishman was unaware of his blunder, and he kept the floor, waiting to be answered.

"What gentlemen do you refer to?" asked the Doctor, blandly.

"The seven gentlemen on the platform," was the answer.

"The church to which we all belong," replied Dr. Phelps, soberly, "is the church of Christ."

"Thank you, sir," said the Englishman, taking his seat, "I vote for The Church of Christ."

To some of the thorough-going denominationalists this seemed a good joke; but the Englishman's positive decision served for wisdom to several of the uninstructed, while many others, perceiving the difficulty of agreeing upon any existing sect, took the cue and wrote his vote upon their ballots. When the slips were collected, there were ten Methodist ballots, six Baptist, three Congregational, one Episcopalian, one Presbyterian, one Lutheran, one Universalist, and twenty-six for a church of Christ.

"Your decision is wise," said the venerable chairman, "and I am happy to say that you will have the hearty sympathy of all the churches in New Albion. In many places, churches of this character are made to feel that they have no relation to any religious body, and their isolation becomes irksome to them, but it is not so with us; you will have as much fellowship with the Congregationalists as if you were a Congregational church, and as many friends among the Baptists as if you were a Baptist church, and so with all the rest. As our youngest sister we shall all have a care for you, and shall be ready to lend you a hand, and we trust that the time will come when we shall be proud of you."

"I want to be a Methodist," said Mr. Thorpe, warmly, "just long enough to shout Amen to all that the Doctor has just said. I love my own church, but I love Christ's kingdom more; and God do so to me, and more also, if I ever lift my hand to divide the people of the Lord when they ought to dwell together in unity."

At the suggestion of Dr. Sampson, a committee of three, from those intending membership, was appointed to draw up a code of rules and a form of government for the new church. One of the members of the committee requested that Dr. Phelps might be added, but the doctor asked that Mr. Strong, who had given much thought to problems of this nature, should be put in his place, and this was done.

The organization thus effected was somewhat unique. It was to be known as "The First Church of Christ in Cyprusville," that being the name fastened upon this innocent suburb by the treasurer of the corporation.

Its only symbol of doctrine was the Apostles' Creed; its form of admission was extremely simple; its rules of procedure were not so elaborate as to invite to litigation. Besides the clerk and the treasurer of the church, there was a board of four wardens and four deaconesses, to supervise the religious and charitable work of the church. The secular affairs were in the care of a board of trustees. A meeting of all these officers, under the title of the "Official Board," over which the pastor was to preside, was to be held once a month for consultation. All important business must, however, be referred to the church. The weekly meeting, previous to each communion, was to be called the "covenant-meeting." Baptism was to be administered to adults by immersion or affusion, as the candidate might choose; as to infant baptism, no rule was made against it, but Mr. Strong advised that parents who wished their children baptized should have the rite performed at their homes, thus respecting the strongest scruple of the Baptist brethren. In case the church should call a pastor who was unwilling to administer this ordinance, the pastors of other churches in the city would cheerfully serve them.

It was not long before the new church was provided with a pastor. A Methodist clergyman, the Reverend Richard W. Gardner, a man of excellent character, who had been "located" without charge in New Albion on account of temporary disability, and who was known to be somewhat weary of itinerating, was easily persuaded to enter upon this work. No formal installation was deemed necessary, but services of recognition were held, in which the new church with its pastor was heartily received into the fellowship of all the churches. The next thing in order was the introduction of the pastor and three delegates into the Christian League. Most "Union" churches are either left out in the cold or else enjoy a disclaimed and surreptitious fellowship with one of the sects, which exposes them to the suspicion of all the other sects; but this one stepped at once into a warm place already waiting for it, and seemed as truly to have "brought love" with it as a new baby does when it comes into a Christian family.

## VI.

Soon after the organization of the church at Cyprusville, an episode occurred which tended not a little to strengthen the bonds of Christian fraternity in New Albion. The Methodist church had long been staggering

under a load of debt. Its edifice, built in the flush times following the war, was an ambitious piece of architecture,—the church of the future, beyond a doubt, since it was much larger than the needs of its congregation,—and the pews were still vacant which the sanguine builders had expected to see occupied by the men who were to pay off the mortgages. Mr. Thorpe had carried this debt now for two years; it had been the burden of his days and the nightmare of his dreams; at length he had brought his congregation to the point of attacking it. He had made several anxious pilgrimages to rich Methodists in neighboring cities, but found small encouragement; it was evident that the Methodists in New Albion must shoulder their own load.

Accordingly, the first Sunday in October was devoted to a carefully planned effort for the payment of the debt. Mr. Thorpe had concluded to dispense with the services of a "finangelist" and to direct his own forces. There was to be no regular service in the church, but the people were invited to meet at ten o'clock in the forenoon, and, by the grace of God, the meeting would not adjourn. Mr. Thorpe said, until the debt was paid. A collation was provided in the basement, so that the people might spend the day in the work.

The debt amounted to thirty-two thousand dollars, and when the meeting opened in the morning seventeen thousand dollars were at once subscribed—this amount having been secured beforehand by private conference with the abler contributors. This excellent start awakened great enthusiasm, and, for a time, subscriptions came in rapidly; but long before noon the limit of the people's ability seemed to have been reached, and the list only footed up about twenty-four thousand dollars. Mr. Thorpe kept his forces well in hand, however, and showed no signs of wavering. Exhortations and appeals were interposed with singing; a judicious and energetic committee did a great deal of personal work with individuals; messengers were dispatched to labor with absentees. But it seemed evident that the large gifts had all been gathered in, and there was still a deficiency of more than seven thousand dollars that the small subscriptions yet to be obtained would by no means supply.

As Mr. Franklin walked home, after the morning service, with his pastor, they passed the door of the Methodist Church.

"Let us look in a moment," said the parson, "and see how they are getting on."

They sat down in one of the back seats and watched the proceedings. From Mr. Thorpe's

occasional remarks they learned the situation of affairs, and saw that the case was probably hopeless, though the resolute leader did not for a moment assent to such a conclusion.

As they walked away, Mr. Franklin said:

"Making a strong fight, aren't they?"

"Yes."

"But they will not take the fort."

"I don't know."

"I do; they've got to the sticking-point, and they will not get past it."

"Pity!" said Mr. Strong, sententiously.

After a moment's thought he added, with a new interest, "It is lawful to pull your fellow-creature out of a pit on the Sabbath day?"

"I should say so, especially when he is trying to get out himself."

"Lawful to hitch up your horse to pull him out?"

"Yes," laughed the minister.

"Well, you go home and get your lunch, and I'll get mine and have Major put into the buggy. I'll be around there before one o'clock, and we'll see what we can do."

"All right."

It was not long before the good white horse came at a week-day pace to the door of the parsonage, and the friends were soon whirling away.

"Now, we've got to be swift," said the banker. "My first thought was to call only on some of our own people, but I am now inclined to give some of the rest a chance. The Episcopalians and the Free Baptists have a heavy debt of their own; the Adventists are not able to help much; we must enlist the others. Brinsmade must call on the First Church folks, Ellsworth on the Baptists, Thompson on the Universalists, you and I will look out for our own."

They were stopping at Mr. Brinsmade's door, and the master of the house answered the bell.

"We have set out," said Mr. Franklin, "to give the Methodists a little lift in paying their church-debt. Will you go and stand in the vestibule of your church and waylay as many as you can of your strongest men as they go into the afternoon service, and get subscriptions from them? Start the paper yourself. Then ask Dr. Phelps to take a collection before the sermon, for the same object. Get cash subscriptions, payable to-morrow at my bank. Report the amount to me at Mr. Strong's house by four o'clock sharp. Will you do it?"

"What a steamboat you are!" said Brinsmade, laughing.

"Will you do it?" said Franklin, strenuously. "No time for nonsense, old fellow!"

"Yes, I'll do it."

"All right. Good-bye!"

And the white horse was soon flying down the street.

None of the other churches had afternoon services, and all that could be done in them must be done by personal application to a few of the more prosperous members. But Mr. Franklin had selected the right man as canvasser in each society, and after they had been set at work, he and his pastor returned to their own parish, which they divided between them, contriving, before four o'clock, to see a good proportion of its most generous members. At that hour they all met at the parsonage, as by agreement, bringing with them a much larger sum than the most sanguine of them had hoped to get.

"They came down handsomely," said Brinsmade. "Three or four refused to give anything; but most of them had their names down before they knew it. It dropped on them so sudden like, that they hadn't time to hunt up excuses. The old doctor warmed up to the business beautifully, and begged like a professional. I didn't suppose it was in him. They brought in nearly four hundred dollars in the boxes, besides all I got from individuals."

The others had much the same story to tell. Sympathy with the Methodists in their courageous effort was universal, and it had found a generous expression.

"Now each one of you sit down and write a short letter," said Mr. Franklin, "explaining that the amount you have collected is from friends in your church, naming the amount and stating where it may be called for to-morrow, and we'll go over at once and send the letters up to Brother Thorpe. I trust he is holding out yet, but it must be pretty tough for a man who doesn't believe in the perseverance of the saints to hang on to such a poor promise."

It was about half-past four when Mr. Franklin and his friends entered the Methodist church. The back seats were all occupied, so they stood in the space behind the pews and looked on. The church was pretty well filled, and Mr. Thorpe was still keeping up a lively fire of appeal and argument, but there were no responses, and it was plain that hope had departed from most of the solicitors.

"Will you walk forward and take seats, gentlemen?" said one of them.

"No, thank you," answered Mr. Franklin. "We are only lobby members. How do you get on?"

"Slowly."

And the solicitor shook his head dolefully.

"How much have you got?"

"Only a little over twenty-five thousand."

"Why don't you stop where you are?"

"Then we lose everything. The greater share of the heavy subscriptions are conditional upon the raising of the whole debt."

"Wont your subscribers make them unconditional?"

"No. We've begged them to, but they are obstinate."

"Pity, isn't it?"

"Yes, sir. It will be a hard blow if we fail now."

The discouraged gentleman walked away. Mr. Franklin's air had been so indifferent that he had not ventured to ask him for anything.

"Send up your letter, Brinsmade," whispered Franklin. "Get that small boy to take it up."

The small boy toddled up the aisle and handed the envelope to Mr. Thorpe, who tore it open eagerly.

"Hallelujah!" shouted the impetuous Methodist. "Brethren, listen to this: 'The First Congregational Church of New Albion sends greeting to the First Methodist Church, with a pledge of sixteen hundred and seventy-five dollars, to be paid to-morrow at twelve o'clock noon, by a check upon the First National Bank.' This is signed in behalf of the church by James W. Brinsmade."

The reading of the letter was followed by a storm of cheers and all the usual Methodist responses, in the midst of which the organ struck up the Doxology, and the whole congregation rose to their feet and sang it with a tremendous energy.

"Will Brother Brinsmade come forward?" shouted Mr. Thorpe. But before he had time to insist on this a little girl was mounting the pulpit with another envelope, which the pastor received with trembling hand. The noise hushed in a moment. This letter stated that five hundred and fifteen dollars, the gift of a few friends in the Universalist Church, would be on deposit the next day, at the same hour and the same place. Over this the furore was redoubled, one enthusiastic brother mounting a seat and calling for "the second verse of the Doxology!"

"Better not protract the agony," said Franklin to Ellsworth. "Let us send up our notes together."

The good minister, who had now for six hours been under a continuous nervous strain, in whose heart confidence had given way to anxiety and anxiety was beginning to change to discouragement, was so completely overcome by the contents of the other two envelopes that he sat down in his chair, and could not speak for a moment, and at length rose, and half sobbed out:

"Two more, brethren. One from friends in the Baptist Church, with a pledge of nine hundred and twenty-five dollars, and one from friends in the Second Congregational Church, with a promise of eighteen hundred and ten dollars. God bless them, every one!"

This time they were all too excited to sing, but there was a volley of amens in response to the last ejaculation, and men and women all over the house were laughing and crying like children.

"Give us the footing now, Brother Harrison," said the minister, at length, to the treasurer, who was keeping account of the subscriptions.

"Thirty thousand one hundred and fifty-five dollars," was the answer.

"Less than two thousand dollars more are wanted," cried Mr. Thorpe. "What do you say to that?"

"Two hundred dollars more for me!" was the first response from one of the heaviest subscribers; and then the supplementary subscriptions, large and small, came pouring in for ten minutes, faster than the treasurer could record them. As soon as there was a short pause, he summed up the amount again, and, rising to his feet, said quietly:

"Thirty-two thousand four hundred and sixty dollars—four hundred and sixty dollars for shrinkage!"

The scene that followed can only be imagined by those who know what an incubus a church debt is to a devoted congregation, and who are also familiar with the ways in which Methodists are wont to express their feelings.

"I perceive," said Mr. Thorpe, rising to his feet after the tempest had subsided, "that all these pledges are to be paid to-morrow at noon at the First National Bank. It is easy to guess who is at the bottom of all this business, and I see him now, standing near the door."

"No scenes for me," whispered the banker to his minister. "I'm going. Make my excuses." And he slipped out of the door and walked quickly away.

"Mr. Walter Franklin is the man," continued the parson, "and he is leaving the house at this moment; will not some one bring him back?"

But that was a vain suggestion. Mr. Franklin, as everybody knew, would not be brought back.

"Mr. Franklin's pastor must answer for him, then," said the minister; and Mr. Strong walked up the aisle amid great cheering. In a few graceful words he told the congregation that Mr. Thorpe was right in his conjecture; that the plan of aiding them in their difficult

undertaking was conceived and set in motion by Mr. Franklin, who had, nevertheless, been supported in the heartiest manner by the gentlemen on whom he had called; that the whole scheme was the inspiration of a moment and the fruit of a few hours' work; and that he trusted the result of it would be, not only the emancipation of the Methodist Church from the bondage of debt, but the strengthening of the bond of fellowship among the churches of New Albion. To that wish there were many fervent responses, and after a prayer of thanksgiving by the pastor, and the singing of "Blest be the tie that binds," the congregation broke up. That day will never be forgotten by any who had part in its doings, and the fruit of the seed then sown will be reaped in the increasing charity of many generations.

#### VII.

At the November meeting of the League, the first suggestion came from Mr. Butterfield of the Free Baptist Church.

"I have been approached," he said, "by several of our active temperance workers, who greatly desire that the churches of this place shall unite in some movement for the promotion of their cause."

"What sort of movement?" asked Dr. Sampson.

"They did not say very definitely," was the answer. "They seem to think that the churches are not doing much for temperance, and that they ought to do more. I think they would like to have us open our churches Sunday evenings for a series of temperance meetings."

"And let them take the management of the meetings?" pursued the Doctor.

"I don't know, but I presume that they would be glad to be recognized in that way."

"No doubt; but I, for one, prefer to manage my own temperance meetings. The last time these people occupied my church they indulged in an amount of detraction and vituperation that I never wish to hear in my pulpit again."

Dr. Sampson's judgment was confirmed by several of the other pastors.

"Might we not, then," asked Mr. Butterfield, "unite our churches in working for temperance under a leadership furnished by themselves?"

"It seems to me," answered Mr. Franklin, "that this is impracticable. Union work in behalf of temperance is one of the hardest things in the world to secure. We can coöperate in ordinary religious work, because the lesson of toleration in religion has been

learned, and because we are all ready to forget those things in which we differ; but, as respects the subject of temperance, there is, as yet, no such toleration; the sectarianism of temperance advocates is fully as violent as the sectarianism of the churchmen was a hundred years ago."

"Are you not rather rough on the temperance workers?" asked Mr. Thorpe.

"I do not mean to be. But just look at the facts. There are gentlemen in this club, I suppose, who sometimes use wine at their tables, and who, though they are careful to abstain from all excess, believe that they have a perfect right to use it as a beverage. There are other gentlemen in this club who regard every such use of it, no matter how careful, as a sin. I do not belong to either of these classes, but I can easily see that persons holding views so perfectly irreconcilable can never work together in promoting temperance. What is more, some of the gentlemen present are in favor of the passage of laws by which other persons in this company would be put into the category of criminals."

"Oh, come, Franklin, that's absurd! You don't mean that," cried Mr. Thorpe.

"I mean just that," persisted Franklin.

"But you know that the prohibitory law that some of us favor, punishes the seller of liquor, not the drinker. There are no liquor-sellers in this room."

"A man cannot ordinarily drink wine without buying it, can he?"

"No, of course not."

"You wish to make it a crime to sell wine to be used as a beverage?"

"Yes."

"If it were a crime to sell, then the buyer would be morally *particeps criminis*, would he not?"

"I suppose so."

"Very well; there are gentlemen here who are in the habit of buying wine to be used as a beverage, and there are other gentlemen here who wish to make the selling of wine for that purpose a criminal act; how can these two classes of persons come to any understanding about temperance work? I am not discussing prohibition. I am not undertaking to justify or to condemn either of these classes of persons; I am only pointing out that the difference between them is, in its nature, insurmountable, and that they can only keep from quarreling about temperance work by ignoring the whole subject."

"Well, I guess you're right," said Mr. Thorpe, soberly.

"Not only is it impossible," the banker continued, "for these two classes to get on comfortably together, but any one who under-

takes to mediate between them is liable to have his head broken. I dared to suggest, last summer, in a temperance meeting, that it was a gross blunder for the total abstainers to make war on all temperate drinkers,—to denounce them as malefactors and to hold them up to public reprobation; that it would be much easier to persuade than to coerce them into the ways of abstinence. For venturing that criticism, I was denounced as a toddy-drinker; and a crowded convention of reform clubs in our town hall applauded to the echo the assertion by one of their orators that I was worse than a rum-seller. So you see that I have verified, in my own experience, the statement that toleration, in this field, does not exist. Not only is there no toleration for differences of theory or practice, there is no toleration for people who preach toleration and who try to bring about a better understanding. The time for coöperation in temperance work will come, but it is not yet."

"I am not ready to come to that conclusion," said Mr. Peters. "When an evil so great as the evil of intemperance exists in any community, it is humiliating to confess that the Christian people of the community are unable to combine against it."

"'Tis true, 't is pity; and pity 't is, 't is true," said Mr. Franklin.

"But is there not one thing that can be done?" said Mr. Peters. "Can we not unite in enforcing the penal clauses of our present law against violators of them. Our law forbids the sale of intoxicating liquors to minors and to intoxicated persons; it also forbids the selling of liquor on Sundays, and between twelve o'clock at night and five o'clock in the morning. To this extent it is a prohibitory law. Now, I am a prohibitionist; and I see no reason why I should not take the amount of prohibition this law allows me and make the most of it. We might enforce these clauses if we would work together; we could make it dangerous to sell to boys, or to sell on Sundays. That would be a great gain; for it is notorious that there is more drinking done on Sunday than on any other day in the week, and that a great many of our boys are forming the drinking habit."

"That is good sense," said Dr. Strickland. "I am not a prohibitionist; I am not a total abstainer; I am one of the men who, as Mr. Franklin says, Mr. Peters seeks to put into the category of criminals,—though I don't mean to let that slight circumstance mar our friendly relations."

Here Peters arose, and extended his hand to the rector amidst much merriment.

"Notwithstanding the heresy of my opinions and the turpitude of my conduct in this

matter of temperance," Dr. Strickland continued, "I am ready to do as much as any other man in this room in the line suggested by Mr. Peters."

"But what can we do?" asked Mr. Henderson.

"We can keep our eyes and ears open," answered Mr. Peters, "and report what we see and hear to the prosecuting agents. These gentlemen are appointed to enforce the law, but they do it very inefficiently,—for what reasons it is not necessary to inquire. It will do them good to know that a number of good citizens are carefully observing their operations. Let me give a bit of my own experience: I was passing along Jackson street the other day, in the rear of Pat Reilly's saloon, and I saw a little boy not more than seven years old come out of the back-door with a pitcher in his hand and walk down the street. As I passed by him I said, carelessly, 'Hallo, bub! got some molasses?' 'No; beer!' he said. I walked right over to the office of Mr. Billings, our prosecuting agent, and told him what I had seen. He was disposed at once to take a high and mighty air, as of one with whose business I was meddling. He wanted to know how I knew that the purchase of the beer was not made by the child's father or some other adult then in the saloon; and whether this child's testimony would convict; and if I thought that what I had told him amounted to legal evidence. My answer was very brief. 'Do you believe,' I demanded, 'that I have told you the truth concerning what I saw?' 'Certainly,' he said. 'Very well,' I answered. 'If you accept that as truth you are morally certain that liquor is illegally sold by Pat Reilly. You know it, and I know that you know it; if you haven't the legal evidence it is your business to get it. Good-morning.' If Mr. Billings should have a call of this sort every day or two, showing him that the people are watching the violations of the law and the manner of its enforcement, it would have a salutary effect upon him."

"That seems feasible," said Dr. Sampson. "One of the greatest curses of this liquor business is the laxity in the enforcement of law, to which it has given rise. Through our liquor legislation, the respect of the people for all law has been greatly weakened. Anything that we can do to add efficiency to the law will be valuable service."

The suggestion of Mr. Peters proved a fruitful one. The attention of the members of the club was called directly to numerous and glaring violations of the law; they took pains to inquire and to report concerning them; and a public sentiment was thus created which resulted in the more vigorous

enforcement of law and in a considerable diminution in the amount of drunkenness.

#### VIII.

AS THE winter drew on, the needs of the poor began to exercise the minds of benevolent persons in New Albion; there was great activity in several of the sewing societies, and the subject came to the front at the December meeting of the Christian League.

"Our constitution names the care of the poor as one of the proper subjects for conference at these meetings," said Dr. Strickland. "Just now there is a great amount of this work to do, not only in our own parish, but also in the district assigned to our church. I wonder whether we are doing this work as effectively as it ought to be done. Little children, with scanty clothing and pinched faces, come to our door every day begging for food. It would be a burning shame to us if any should be left to suffer."

"By the way," said Mr. Strong, "what do you do for these children that come begging for food?"

"Feed them, of course," answered the rector. "We never give money to unknown beggars, and we never refuse food to any one, known or unknown, who asks for it at our door."

"I should like to know," Mr. Strong suggested, "how many of the members of this club adopt Dr. Strickland's rule in this matter."

The answers showed that it was the rule of the majority. One or two owned that they had no consistent method of dealing with such cases; most of the members concurred with Mr. Henderson when he said:

"I never could bring myself to refuse food to any person, old or young, who asked for it at my door. I could not refuse without feeling that I had disobeyed the command of Christ. 'Give to him that asketh thee.' I should blame myself if, with food in my house, I suffered any one to feel the pains of hunger."

"So far as the Lord's command is concerned," said Dr. Sampson, "it is not restricted to gifts of food; it is an unqualified rule, is it not?"

Mr. Henderson owned that it was.

"Why, then, does it not require you to give money as well as food to every one who asks for it?"

"I confess," said Mr. Henderson, "that my exegesis is not very clear; but it always seemed to me that gifts of food are somewhat different from gifts of money; and that while it is evidently injudicious to give money to beggars, it is a sin in this land of plenty to let any body go hungry."

"But Paul says," Mr. Strong ventured, "that if any man will not work, neither shall he eat. That maxim, too, is unqualified."

"How about those who are out of work and can find no employment?" queried Mr. Thorpe.

"The rule does not apply to them. If 'any man *will not* work,' its language is. Those who, for any reason, are unable to earn their livelihood must be fed. But in many cases 'can't' is the mask of 'wont'; the inability to find work is the fruit of a disinclination to work; and when it becomes evident that indolence is the root of the trouble, then starvation is the apostolic remedy, and I believe that it is the right remedy."

"I can't stand by and see a man starve, no matter what his fault may be?" protested Mr. Thorpe.

"I can," said Mr. Strong. "I shouldn't like to witness the suffering, but I would rather do it than violate that law of God which makes starvation the just penalty of idleness. We have set aside that law by our lazy and indiscriminate charities, and the consequence is a rapid increase of the pauper class in all our cities and large towns. It is time that we began to see the righteousness of that law, and to help in enforcing it, instead of helping men to evade it. There are just two things for us to do in this work of caring for the poor: We must make sure that no one who is both needy and helpless shall be allowed to suffer; and we must make it equally sure that no one who will not work shall escape suffering."

"But I do not see," said Dr. Strickland, "what this doctrine has to do with those little children who come to our doors for food. They are not able to earn their own livelihood; on Mr. Strong's principle I ought to feed them."

"Have you taken pains," asked Mr. Strong, "to investigate the life of any of these children?"

"Why, yes; I have questioned them. One of the cases, for example, is that of a little girl whose father was killed in the war and whose mother is sick with rheumatism. She came to the door the other day when we were at dinner, and it was the first time I had seen her. The poor child was scantily clad, and had the most pitiful face I ever saw."

"What was her name?" asked Mr. Strong.

"I do not recall it."

"Was it Katy Macauley?"

"Yes; I think that was it."

"Did she tell you where she lived?"

"Somewhere on James street, I think."

"Yes; that is likely. She gives a great

many addresses, but never the true one. Her home is at the top of the brick block, on the corner of Swift and Thorne streets; her mother is a miserable drunkard, not an invalid at all, and she is wholly supported by what this child brings in. The clothing that Katy begs she peddles for money and thus supplies herself with rum. Whether the father was killed in the war or not is known to nobody in this town; they have only lived here a few months; but it is certain that good Christian people who put food into Katy Macauley's basket are innocently helping to support the mother in vice and to doom the child to the life of a beggar. That is her calling now; what it will be by and by can be easily conjectured."

"You astound me," cried the good rector. "I had never dreamed of such a condition of things."

"This is not an exceptional case," continued Mr. Strong. "For more than two years my wife has followed home every child who has begged at our door, and she has yet to find a single instance in which the parents are not either drunkards or criminals, or both; and I have conferred with several intelligent persons in Bradford, and in other cities, who have made a study of such cases, and they tell me that children who beg, come, almost universally, from homes of vice and shame. People who are really deserving of charity do not send their children out to beg. The support of these wretched people in idleness is a great evil, but it is nothing compared with the wrong that is done in making it possible for them to bind their children to the trade of beggary."

"But you do come, now and then," said Mr. Peters, "on a pitiful case. A poor French woman came to me in great distress a few weeks ago. She stood weeping on the porch, and would not go in. It was difficult to learn her trouble, partly because her knowledge of English was imperfect, but chiefly on account of her grief and shame. Her husband had deserted her, leaving five young children to be provided for. She was in actual want. I followed her to her wretched home, and found things as she had represented them."

"What was her name?" asked Dr. Sampson.

"Duquette," answered Mr. Peters.

"Yes," said the Doctor; "I know them. But why did they appeal to you? They are in our visiting district, and their children attend our Sunday-school."

"One of them," answered Mr. Peters, "is a member of our Sunday-school."

"Where do they live?" asked Mr. Henderson.

"On Sands street." The answer was volunteered by three or four.

"The woman came to me, not long ago," said Mr. Henderson, "and our church has aided her once or twice."

"How many children did Mr. Peters find, on his visit to Mrs. Duquette?" Mr. Strong wished to know.

"I saw only three; the other two were not in."

"No," said Mr. Strong, "the other two are a boy of fifteen and a girl of sixteen who were at work in one of the shoe-shops. They earn about twelve dollars a week. Add to this the amount given to this family by three churches within the last few weeks, and the liberal weekly orders given them by the town overseers of the poor, to whom they have applied for aid, and you will see that Mrs. Duquette has been substantially comforted for the loss of her husband, who has indeed run away."

The laughter that followed this exposure was at the expense of so many people that it could afford to be hearty and general.

"Nevertheless, brethren," said Dr. Sampson, "we have the poor always with us—Christ's poor as well as the other kind; and the duty of finding them out and ministering to them is not to be neglected."

"Not only so," added Mr. Strong; "these very people that we have been talking about appeal to our charity quite as strongly as those whom we call the worthy poor. We must take care that they do not subsist in idleness and vice upon our gifts. Of material aid they need but little, though, sometimes, even to them, a little help of this sort in starting on a new career may not be amiss; but they need friendship more than anything else in the world,—a firm, sensible, honest, patient friend, who will show them a better way of living, and lead them into it, is, for every one of these wretched families, the one thing needful. The discovery that a large class of people exists among us who are harmed by the indiscriminate bestowment of money or material aid is no sign that less charity is called for; not less, but more is demanded, only it must take a different form. I find no difficulty whatever in accepting Christ's unqualified rule of charity: 'Give to him that asketh thee.' Give to every beggar, I say; give him what he needs most, and satisfy yourself, before you give him anything, what are his deepest needs. If money will do him the most good, give him money; if food or clothing will do him the most good, give him food and clothing; but, if you study his case, you will probably find that the aid most needed is moral rather than physical. Some direction the man may require, and some encouragement, and much

bracing of his will, and not a little rousing of his self-respect. If there is any kind of Christian work more imperative than this, I do not know where to find it. And there is enough of it to do. The problem of pauperism confronts us. In all our larger towns we find a growing class of those who are willing to subsist without work. The slipshod way in which official relief is generally given by the civil authorities encourages pauperism. The effect of our large system of industry, which builds up great corporations and gathers into tenement-houses a vast homeless population that drifts about from place to place and never takes root anywhere, is, I greatly fear, to develop pauperism. So we have among us a large number of these discouraged, unthrifty, hapless people, some of whom have begun to ask for alms, and some of whom have asked so often that mendicancy has become chronic with them. It takes but a short time for a family to sink down from self-respect to beggary, and, once in that slough, it is very hard to get out. Last winter our overseers of the poor granted out-door relief to more than one thousand different persons—one in fifteen of the whole population. The times were hard, but these figures must include not a few whose poverty arose from a defect of will. This shows us what a work we have to do, and I heartily agree with Dr. Strickland in thinking that it is high time we were about it. Excuse me, gentlemen, for inflicting on you a lecture, but the subject is one in which I am deeply interested."

"How are we to deal with this problem?" said Mr. Franklin.

"We need but little additional machinery," said Dr. Sampson. "The town is divided geographically among the churches; each church ought to subdivide its territory, and assign to each small district one or two visitors. There ought to be a central committee, meeting weekly during the winter and consisting of one person from each church. This committee should have an office, at which a record should be kept of all the cases aided, with full particulars of each case,—a record open to the inspection of visitors only. It would be better to have a common relief fund, under the control of the committee; visitors to grant only temporary relief, until they had laid the case fully before the committee. It would be necessary to have a secretary who should keep the register and who should be in the office at certain hours every day. Then the people should be pledged, if possible, to give no money, food, or clothing to unknown persons, but to refer every applicant to this secretary, who should put the case at once into the hands of the

visitor in whose district the applicant lived. The secretary would need a map of the town, with the boundaries of each sub-district, and the name and address of its visitor. Thus all applications for alms could at once be investigated, and that over-lapping of charity, on which pauperism thrives, would not be possible."

"The doctor's scheme seems rational and feasible," said Mr. Franklin. "Can we not have the members of such a Central Committee chosen by the churches this very week?"

To this question there was no negative.

"Then," said the banker, "I trust the Doctor himself will attend the first meeting of the Committee, and submit his sketch of an organization; and that the churches will speedily subdivide their territory and appoint their visitors. No time should be lost."

"You've got some work to do," said Dr.

Strickland, "in enlightening the community. Most of us have loose notions of what charity is. This talk has helped me, but the majority of my neighbors are as much in the dark as I was an hour ago."

"This is true," Mr. Strong added, "not only of the church-people, but also of all those persons who sneer at the churches and who boast a religion of 'good works.' The man who does not go to church, but who gives the poor family his ton of coal or his barrel of flour, off hand, and no questions asked, is the hero of a certain class. It will be difficult to make them see that their hero is doing about five times as much harm as good; and that what these poor people need is not tons of coal or barrels of flour, but time and thought and patient friendship. But if any man, saint or sinner, wants to follow Jesus Christ, this is the path by which he can come nearest to him."

(To be continued.)

## MY ADVENTURES IN ZUÑI.

ONE hot summer day in 1879, as I was sitting in my office in the ivy-mantled old South Tower of the Smithsonian Institution, a messenger boy tapped at my door, and said:

"Professor Baird wishes to see you, sir."

The professor, picking up his umbrella and papers, came toward the door as I entered.

"Haven't I heard you say you would like to go to New Mexico to study the cliff-houses and Pueblo Indians?"

"Yes, sir."

"Would you still like to go?"

"Yes, sir."

"Very well then, be ready to accompany Colonel Stevenson's collecting party, as ethnologist, within four days. I want you to find out all you can about some typical tribe of Pueblo Indians. Make your own choice of field, and use your own methods; only, get the information. You will probably be gone three months. Write me frequently. I'm in a hurry this evening. Look to Major Powell, of the Bureau of Ethnology, if you want further directions. Good-day."

Thus it happened that, on a sultry afternoon in late September, by no means firmly seated in the first saddle I had ever bestridden, I was belaboring a lazy Government mule just at the entrance of a pass between two great banded red-and-gray sandstone mesas, in the midst of a waterless wilderness. I had ridden from Las Vegas, then the south-

ern terminus of the railway across New Mexico, to Fort Wingate, and over a spur of the Sierra Madres, until here I was far in advance of our little caravan, and nearer the close of my long journey than I had dreamed. Beyond the pass I followed the winding road up a series of cedar-clad sand-hills to where they abruptly terminated in a black lava descent of nearly two hundred feet.

Below and beyond me was suddenly revealed a great red and yellow sand-plain. It merged into long stretches of gray, indistinct hill-lands in the western distance, distorted by mirages and sand-clouds, and overshadowed toward the north by two grand, solitary buttes of rock. From the bases of the latter to a spire-encircled, bare-faced promontory to the right, stretched a succession of cañon-seamed, brown, sandstone mesas, which, with their mantle of piñon and cedar, formed a high, dark boundary for the entire northern side of the basin.

To the left, a mile or two away, crowning numberless red foot-hills, rose a huge rock-mountain, a thousand feet high and at least two miles in length along its flat top, which showed, even in the distance, fanciful chiselings by wind, sand, and weather. Beyond its column-sentined western end the low sand-basin spread far away to the foot-hills of the gray-and-white southern mesas, which, broken

by deep cañons, stretched, cliff after cliff, westward to the hills of the horizon.

Out from the middle of the rock-wall and line of sand-hills on which I stood, through a gate of its own opening, flowed a little rivulet. Emerging from a succession of low mounds beneath me, it wound, like a long whip-lash or the track of an earth-worm, westward through the middle of the sandy plain and out almost to the horizon, where, just midway between the northern buttes and the opposite gray mesas, it was lost in the southern shadows of a terraced hill.

Down behind this hill the sun was sinking, transforming it into a jagged pyramid of silhouette, crowned with a brilliant halo, whence a seeming midnight aurora burst forth through broken clouds, bordering each misty blue island with crimson and gold, then blazing upward in widening lines of light, as if to repeat in the high heavens its earthly splendor.

A banner of smoke, as though fed from a thousand crater-fires, balanced over this seeming volcano, floating off, in many a circle and surge, on the evening breeze. But I did not realize that this hill, so strange and picturesque, was a city of the habitations of men, until I saw, on the topmost terrace, little specks of black and red moving about against the sky. It seemed still a little island of mesas, one upon the other, smaller and smaller, reared from a sea of sand, in mock rivalry of the surrounding grander mesas of Nature's rearing.

Descending, I chanced to meet, over toward the river, an Indian. He was bare-headed, his hair banged even with his eyebrows in front, and done up in a neat knot behind, with long locks hanging down either side. He wore a red shirt and white cotton pantalets, slitted at the sides from the knees down so as to expose his bare legs, and raw-hide soled moccasins. Strings of shell-beads around his neck, and a leather belt around his waist, into which were stuck a boomerang or two, completed his costume. Knitting-work in hand, he left his band of dirty white and black sheep and snuffling goats in charge of a wise-looking, grizzled-faced, bob-tailed mongrel cur, and came, with a sort of shuffling dog-trot, toward the road, calling out, "Hai! hai!" and extending his hand with a most good-natured smile.

I shook the proffered hand warmly, and said, "Zuñi?"

"E!" exclaimed the Indian, as he reverentially breathed on my hand and from his own, and then, with a nod of his head and a fling of his chin toward the still distant smoky terraces, made his exclamation more intelligible.

I hastened on with all the speed I could scourge out of my obstinate, kicking mule, down the road to where the rivulet crossed it, and up again, nearer and nearer to the strange structures.

Imagine numberless long, box-shaped, adobe ranches, connected with one another in extended rows and squares, with others, less and less numerous, piled up on them lengthwise and crosswise, in two, three, even six stories, each receding from the one below it like the steps of a broken stair-flight,—as it were, a gigantic pyramidal mud honey-comb with far outstretching base,—and you can gain a fair conception of the architecture of Zuñi.

Everywhere this structure bristled with ladder-poles, chimneys, and rafters. The ladders were heavy and long, with carved slab cross-pieces at the tops, and leaned at all angles against the roofs. The chimneys looked more like huge bamboo-joints than anything else I can compare them with, for they were made of bottomless earthen pots, set one upon the other and cemented together with mud, so that they stood up, like many-lobed, oriental spires, from every roof-top. Wonderfully like the holes in an ant-hill seemed the little windows and door-ways which everywhere pierced the walls of this gigantic habitation; and like ant-hills themselves seemed the curious little round-topped ovens which stood here and there along these walls or on the terrace edges.

All round the town could be seen irregular, large and small adobe or dried-mud fences, inclosing gardens in which melon, pumpkin and squash vines, pepper plants and onions were most conspicuous. Forming an almost impregnable belt nearer the village were numerous stock corrals of bare cedar posts and sticks. In some of these, burros, or little gray, white-nosed, black-shouldered donkeys, were kept; while many others, with front legs tied closely together, were nosing about over the refuse heaps. Bob-tailed curs of all sizes, a few swift-footed, worried-looking black hogs, some scrawny chickens, and many eagles—the latter confined in wattled stick cages, diminutive corrals, in the corners and on the house-tops—made up the visible life about the place.

Not an Indian was anywhere to be seen, save on the topmost terraces of this strange city. There hundreds of them were congregated, gazing so intently down into one of the plazas beyond that none of them observed my approach, until I had hastily dismounted, tied my mule to a corral post, climbed the refuse-strewn hill and two or three ladders leading up to the house-tops. The regular

GENERAL VIEW OF ZUÑI.

*thud, thud* of rattles and drum, the cadence of rude music which sounded more like the souging of a storm wind amid the forests of a mountain than the accompaniment of a dance, urged me forward, until I was suddenly confronted by forty or fifty of the men, who came rushing toward me with excited discussion and gesticulation. One of them approached and spoke something in Spanish, motioning me away; but I did not understand him, so I grasped his hand and breathed on it as I had seen the herder do. Lucky thought! The old man was pleased; smiled, breathed in turn on my hand, and then hastily addressed the others, who, after watch-

ing me with approving curiosity, gathered around to shake hands and exchange breaths, until I might have regarded myself as the President, had not an uproar in the court attracted them all away,—all, save one, a young, cadaverous-looking fellow with strange, monkey-like little eyes, who lingered behind and ventured:

“How-li-loo?”

“Pretty well,” I replied. “How are you?”

“’At’s good,” said he, and this useful phrase he employed in every answer to my crowded queries, until I reluctantly concluded that it was the extent of his English. It was amusing to see his efforts, by constantly repeating

FIRST VIEW OF ZUÑI FROM MAL-PAIS MESA.

POOL OF ZUÑI AND WATER-CARRIERS.

this phrase, ducking his head and grinning, to convince the other Indians that he was carrying on a lively conversation with me.

At last, gaining my wished-for position on the edge of the terrace, I came face to face with nearly the whole population of Zuñi. The music had ceased, and the dancers had temporarily retired, but all over the upper terraces were young men in groups and pairs, jauntily mantled in red, green, blue, black, and figured blankets, only the upper portions of their painted faces and occasional patches of their silver-bedecked persons being exposed. Here and there an elaborately plumed straw hat surmounted one of these enveloped statues, aside from which not an article of civilized apparel appeared. Opposite, women and girls, attired in clean, blue-black, embroidered blanket dresses, neat, softly draped head-shawls, and huge-legged, white buckskin moccasins, were standing and sitting on the lower terraces, or in one side of the court below. The older ones were holding their children and talking to them; the younger, intently watching for the dance, or slyly glancing from under their banged hair, which, black as jet and glossy with oil, was combed down over the eyes and parted a little to one side. Old, gray-headed men, muffled in heavy, striped serapes, sat or squatted around, or leaned on their crooked sticks. Innumerable children, some naked, others half clad in tattered cotton shirts and

short trousers, were chasing one another about the terraces, wrestling, screeching, or pelting any stray dog that came around, while a few imitated the older people by sitting in silent expectation.

After a brief interval, a priest, with plumed head and trailing white buckskin mantle, gravely stepped in through a tunnel under the houses, scattering on the ground, as he came, sacred meal from a vessel which he held in one hand, while with the other he waved a beautiful wand of macaw plumes. He was followed by some twenty dancers elaborately costumed from head to foot. Close-fitting plumed wigs covered their heads, and black, long-bearded, yellow-eyed masks, with huge rows of teeth from ear to ear, red tongues lolling out between them, gave frightful grinning expressions to their faces. Their half-nude bodies were painted black and yellow, while badges of buckskin were crossed over their shoulders, and skirts of the same material, secured at the waists with elaborately embroidered and fringed sashes, depended to the ankles. Their feet were incased in green and red buskins, and to the legs were bound clanging rattles of tortoise-shell and deer-hoofs. Their necks were decorated with heavy necklaces of shell beads and coral, shining disks of *haliotis* hanging from them in front and behind; while the arms were bedecked with green bands, fluttering turkey plumes, silver bangles and wrist-guards of the same material. Each carried in his right hand a painted gourd rattle, in his left, bow, arrows and long wands of yucca.

As the leader sounded his rattle they all fell into a semicircular line across the plaza, and began stepping rapidly up and down, swaying from side to side, facing first one way, then the other, in perfect unison, and in exact time to their rattles and strange measures of wild music.

Sprawling about the ground in front of and behind the row of dancers, in attitudes

grotesque yet graceful, I observed for the first time ten most ludicrous characters, nude save for their skirts and neck-cloths of black tattered blanketing, their heads entirely covered with flexible, round, warty masks. Both masks and persons were smeared over with pink mud, giving them the appearance of reptiles in human form that had ascended from the bottom of some muddy pool and dried so nearly the color of the ground and the surrounding houses that at first it had been difficult to distinguish them.

One of them seated himself a little way off and began pounding with a short, knotty war-club a buffalo-skin bale, which he held between his knees, while the others, motionless save for their heads, which they were continually twisting and screwing about, or nodding in time to the drummer's strokes, kept up a series of comments and banterings which sometimes convulsed the whole throng of spectators with laughter.

In a few moments the leader shook his rattle again, and the dancers ceased as promptly as they had begun, breaking up irregularly and bellowing out long war-cries, brandishing their weapons, and retiring, as they had entered, one by one in the wake of the priest, through the tunnel. Suddenly the motionless, warty-headed figures sprang up, running against one another, crying out in loud tones, and motioning wildly with their long, naked arms. One moment they would all gather around one of their number, as if intensely interested in something he was saying, then as suddenly they would run confusedly about. They would catch up balls and pelt one another most vehemently, such as were struck making great ado about it. One of them discovered me. Immediately he stretched his fingers out and called excitedly to his companions, who pretended to hide behind him and the ladders, peering at me with one or the other of their black, wen-shaped eyes with the most frightened, and, at the same time, ridiculous looks and expression. Their antics were cut short by a renewal of the dance. While one commenced the drumming, another whirled a whizzing stick, and as soon as the others had arranged the costumes of some of the dancers, and had seen them fairly in line, they resumed their sprawling attitudes on the ground.\*

Meanwhile, our party had arrived, and the

escort had pitched camp in the corral of the mission and school down on the plain about a quarter of a mile north from the pueblo. In one corner, Mr. Hillers, our photographer, and I found a cozy little tent. I spread blankets over the ground, hung pictures and toilet-case on the wind-swayed walls, and thus, with a trunk in either corner, a cot along either side, we made a snug little home for ourselves.

We had not been there long when, to Hillers' disgust and my delight, two or three Indians approached, peered through the fly, and then came in, and squatted on their haunches near the entrance. They took the cigarettes I offered them, and made the interior blue with smoke within a few minutes. They were jolly, talkative fellows, and taught me all sorts of words in their strange, clicky language. Whenever they talked for any length of time, it seemed as if each sentence, long or short, was said in a single breath. At the end of each the speaker would pause, draw a long whiff of smoke from his cigarette, gulp it all into his lungs and begin again, the smoke and words issuing simultaneously from his throat.

Toward sunset, the Gobernador, or head chief, Pa-lo-wah-ti-wa, with some of his *timi-*

\* These were the *K'ó-ye-mo-shi*, or "Guardians of the 'Sacred Dance,'" whose business is to entertain the spectators during the intervals of the dance, by rude buffoonery and jokes, in which comic speeches and puns play an important part. The office is sacred, and elective annually from among the priesthood of the nation.

A MIDSUMMER TERRACE.

*cutes*, or sub-chiefs, and the herald of the town, came down to our camp. He was about forty-five years of age, of medium stature, and stooped slightly when walking. He was a grave man of but few words, yet with a kindly expression in his face, which was so finely molded, that in profile it ap-

peared like an Egyptian cameo, the resemblance being heightened by the deep lines of character about his eyes, hollow cheeks, and large, fine mouth, as well as by his rather broad ears shaded with locks of soft jet-black hair. After partaking sparingly of the food we offered him, he thanked us simply and in-

RETURNING FROM THE FIELD.

quired if we wished anything. Learning our desiderata, he gave a few quiet directions to the herald and *tinientes*, and then departed, not, however, before inviting us to come up on the morrow, to eat peaches and melons with him. Soon after a long musical call proclaimed the governor's orders. From my tent door I could see, on the topmost house of the pueblo, the distant, erect figure of the herald against the twilight sky, a serape thrown gracefully over his shoulders like a Roman toga,—an example of Indian obedience.

Some of us, a young officer and several ladies who had joined our party, strolled up to the pueblo, through a sandy lane and along the winding pathway that led down the hill to a well. As I sat watching the women coming and going to and from the well,

"How strangely parallel," I thought, "have been the lines of development in this curious civilization of an American desert, with those of Eastern nations and deserts." Clad in blanket dresses, mantles thrown gracefully over their heads, each with a curiously decorated jar in her hand, they came one after another down the crooked path. A little passageway through the gardens, between two adobe walls to our right, led down rude steps into the well, which, dug deeply in the sands, had been walled up with rocks, like the Pools of Palestine, and roofed over with reeds and dirt. Into this passageway and down to the dark, covered spring they turned, or lingered outside to gossip with new comers while awaiting their chances, meanwhile slyly watching, from under their black hair, the strange visitors from "Wa-sin-to-na." These water-carriers were a picturesque sight, as, with stately step and fine carriage they followed one another up into the evening light, balancing their great shining water-jars on their heads.

We attempted to penetrate a narrow street or two, to enter one of the strange, terrace-bounded courts, but the myriad dogs, with barks and howls in concert, created such a yelping pandemonium that the ladies were frightened, and we returned to camp.

The next morning I climbed to the top of the pueblo. As I passed terrace after terrace the little children scampered for sundry sky-holes, through which long ladder-arms protruded, and disappeared down the black apertures like frightened prairie dogs; while the women, unaccustomed to the sound of shoes on their roofs, as suddenly appeared head and shoulders through the openings, gazed a moment, and then dropped out of sight.

STREET SCENE.

Five long flights passed, I stood on the topmost roof.

Spread out below us were the blocks of smoothly plastered, flat-roofed, adobe cells, red and yellow as the miles of plain from which they rose, pierced by many a black sky-hole, and ladder-poles and smoke-bannered chimneys were everywhere to be seen. In abrupt steps they descended toward the west, north, and central plaza, while eastward they were spread out in broad flats, broken here and there by deep courts. The whole mass was threaded through and through by narrow, often crooked, passage ways or streets, more of them lengthwise than crosswise, and some, like tunnels, leading under the houses from court to court or street to street.

The view extended grandly from the out-lying, flat lower terraces, miles away to the encircling mesa boundaries north, east, and south, while westward a long, slanting

notch in the low hills was invaded to the horizon by the sand-plain through which, like molten silver, the little river ran.

Every school-boy sketches a map of the Zuñi basin when he attempts with uncertain stroke to draw on his slate a cart-wheel. The city itself represents the jagged hub, whence the radiating, wavering trails form the spokes, and the surrounding mesas and hills, the rim. Let some crack across the slate and through the middle of the picture indicate the river, and your map is complete.

In and out, on the diverging trails, the Indians were passing to and from their distant fields, some on foot, some on burro-back, with others of the little beasts loaded from tail to ears with wood, blankets full of melons, pumpkins and corn, or great panniers of peaches. A series of them away out on the bare plain, mere moving specks in the distance, appeared like a caravan crossing a desert waste. Occasionally a half-nude rider, mounted on a swift-footed pony would come dashing in from the hills. Far away he seemed a black object with a long trail of golden dust behind, but his nearer approach revealed remarkable grace of motion and confusion of streaming hair and mane. There was an occasional heavily laden ox-cart, with urchins sprawling over the top, a driver on either side, and leading up the rear a mounted donkey or two; while away to one side, more picturesque than all this, a band of dust-shrouded sheep straggled over the slopes toward their mesa pastures, followed by their solitary herder and his dog.

Strangely out of keeping with the known characteristics of the Indian race were the busy scenes about the smoky pueblo. All over the terraces were women, some busy in the alleys or at the corners below, husking great heaps of many-colored corn, buried to their bushy, black bare heads in the golden husks, while children romped in, out, over and under the flaky piles; others, bringing the grain up the ladders in blankets strapped over their foreheads, spread it out on the terraced roofs to dry. Many, in little groups, were cutting up peaches and placing them on squares of white cloth, or slicing pumpkins into long spiral ropes to be suspended to dry from the protruding rafters.

One of these busy workers stopped, deposited her burden, and hailed a neighboring house-top. Almost immediately an answering echo issued from the red stony walls, and forthwith a pair of bare shoulders seemed to shove a tangled head and expectant countenance up through an unsuspected sky-hole into the sunshine. In one place, with feet

over-hanging the roof, a woman was gracefully decorating some newly made jars, and heaps of the rude but exquisite bric-à-brac scattered around her,—while, over in a convenient shadow, sat an old blind man, busy spinning on his knee with a quaint bobbin-shaped spindle-whorl.

Out near the corrals old women were building round-topped heaps of dried sheep dung, and depositing therein with nice care their freshly painted pots and bowls for burning. Others, blankets in hand, were screening their already blazing kilns from the wind, or poking the fires until eddying columns of black pungent smoke half hid them from my view, and made them seem like the "witches and cauldrons" of child-lore.

Children were everywhere, chasing one another over the terraces, up and down ladders, through alleys, and out again into the sunlight. Some, with bows and arrows, sticks and stones, were persecuting in mock chase dogs and hogs alike, as attested by their wild shrieks of delight, or the respondent ceaseless yelps arising seemingly from all quarters of the town at once.

Along the muddy river below the long southern side of the pueblo, more of these youngsters were ducking one another, or playing at various games on the smooth, sandy banks. Women, too, were there engaged in washing wool or blankets on flat stones, or in cleansing great baskets of corn. I was attracted thither and observed that these primitive laundresses had to raise the water with little dams of sand. I smiled as the thought occurred that the first expedition of Americans to Zuñi had been sent here by Government to explore this self-same river, "relative to its navigability."

At the south-western corner of the town, on the river bank, stood the house of the governor. The herald had called a council, and beckoned me to enter. In one of the large rooms the tribal dignitaries were assembling. Some came wrapped closely in their blankets, bearing old canes in their arms,—relics of a forgotten Spanish rule. In a stately, grave manner they approached each of us, shook hands, and took their seats along the northern side of the room. Others, evidently unofficial persons, sauntered inside the door and dropped on their haunches as near to it as possible. Immediately on sitting down, each took out a small piece of plug tobacco, picked it to powder, then, cutting a suitable length of corn-husk with his thumb-nail, rolled a cigarette, and began a protracted smoke. The older ones usually blew the smoke in different directions, closing their eyes, drooping their heads, and

muttering a few words which I regarded as invocations.

We told them, as well as we could through our Mexican interpreter, that we were from Washington, whereupon several arose, advanced, and taking our hands breathed from them as though desirous of drinking in the influence of the revered name; \* that their father was anxious to see how they lived, and to get some of their beautiful articles to show his white children, therefore he had sent us there with many fine things to trade. To everything they replied, "*We-no*" (*Bueno*). So, securing the large room of the governor's house for Hillers' use, Colonel Stevenson closed the council by giving the multitude a liberal feast of coffee and sugar.

Not many days after the Indians began to bring all sorts of their odd belongings down to the mission. Through the courtesy of Dr. Ealy, the missionary, Colonel Stevenson occupied two of the rear rooms as a trading establishment, and day after day, assisted by his enthusiastic wife, gathered in treasures, ancient and modern, of Indian art and industry. Meanwhile, Hillers and I were busy about the pueblo, the former with photographing, myself with measuring, sketching, and note-taking.

Within a week the Indians could be heard every night singing, and pounding a great drum, in preparation for a dance. It was of a semi-social character, and when, on the morning of the great day, before the assembled multitude, I began sketching in colors the gayly costumed figures below, only lively curiosity was excited and young people gathered so closely around me that it was almost impossible to work. For a long time afterward, as I climbed to the house-tops or sat down in shady old nooks to take notes, the women would gather near, and ask me, with incessant jabber and significant looks, to show them the colored drawings. They were wonder-struck, and would pass their fingers over the figures as though they expected to feel them. Failing in this, they would look at the backs of the leaves, as children look behind mirrors to see what had become of the images.

With a dance that occurred soon after, I was not so successful. It was the sacred water-dance. The long, embroidered cotton garments and strange masks of this wonderful ceremonial would have claimed space in my sketch-books, even had I not been intent on representing everything I saw. When I took my station on a house-top, sketch-books and

colors in hand, I was surprised to see frowns and hear explosive, angry expostulations in every direction. As the day wore on this indignation increased, until at last an old, bushy-headed hag approached me, and scowling into my face made a grab at my book and pantomimically tore it to pieces. I was chagrined, but paid no attention to her, forced a good-natured smile, and continued my sketching. Discouraged, yet far from satisfied, the natives made no further demonstrations.

Among my drawings was the portrait of a pretty little girl. An old white-headed grandmother, looking the sketches over one day, recognized this. She shook her head, frowned, and, covering her face with her withered hands, began to cry and howl most dolefully, leaving me abruptly and disappearing into a room adjoining the governor's. At intervals during the remainder of the day, I could hear her talking, scolding, and sobbing over what she regarded as a great misfortune to her family.

I was exercised by this state of feeling, which became, as time went on—especially with those conservators of the ancient régime the world over, old women—more and more virulent. The sketching and note-taking were essential to my work. I was determined not to give them up, but was desirous, so far as possible, of conciliating the Indians. I therefore began with the children. They would scamper up ladders and stand on the roof tops as I passed, but for all that had a lively curiosity concerning me, and would shout to one another, "*Is-tu-shí, Me-lik-í-a!*"—which I rightly divined was, "Just look, the little American is coming!" I began carrying sugar and pretty trinkets in my pockets, and whenever I could tempt some of them near with a lump of the rare delicacy, would pat them on the head and give them the pretty trinkets, or even take the less shy and dirty of them in my arms. I grew in their favor, and within a few days had a crowd of them always at my heels. The parents were delighted, and began to share the affection of their children. Nevertheless, the next time I sketched a dance, all this went for nothing.

Much discouraged, at last I determined to try living with the Indians. Accordingly I moved books, papers, and blankets to the governor's house. On the dirt floor in one corner I spread the blankets, and to the rafters slung a hammock. When the old chief came in that evening and saw that I had made myself at home, he shrugged his shoulders.

"How long will it be before you go back to Washington?" he attempted to ask.

\* "Washington" is a term used by nearly all the south-western Indians, not as the name of a place or person, but as that of a government.

"Two months," I signified.

"*Tuh!*" (damn) was his only exclamation as he climbed to the roof and disappeared through the sky-hole.

consisted of a thin adobe wall, about five feet high by as many wide, which stood at right angles with the main wall of the house, and was capped by a structure overhead of thin

POTTERY FIRING.

The room was forty feet in length by twelve in width. The white-washed walls and smooth, well swept floor of plastered mud, paved near the center and at the entrance with slabs of sandstone, gave it a neat appearance. Huge round rafters supported the high, pine-stave ceiling, pierced near one end with a square hole for entrance and exit, and along the center with lesser apertures for the admission of light. Two or three silenite glazed port-holes in the walls served as additional windows, and as many square openings led into other rooms. A carved pine slab, hung on heavy wooden hinges and secured by a knotted string, served as the door of one, while a suspended blanket closed another. A low adobe bench around the room appeared to be the family sitting-place. It was interrupted near one end by the mealing trough and fire-place. The latter

sandstone slabs, not unlike the cover of a box, from the corner of which next to the wall rose a flue of long flag-stones to the ceiling. On one side, at its base, a commodious square space was inclosed by narrow stones set edgewise in the ground.

Between the fire-place and the end of the room, eight or ten *metlalls* were slantingly set side by side in a trough of stone,—the mills, coarse and fine, of the household. Along the opposite side of the room was suspended from the rafters a smooth pole, upon which hung blankets, articles of clothing, and various other family belongings. More of the like, including quivers and bows, war-clubs, and boomerangs or "rabbit-sticks," disks of *haliotis* shell, and other ornaments, depended from pegs, and deer or antelope-horns on the walls. Some large, finely decorated water-jars, and a black earthen cooking-pot by the

DECORATING POTTERY.

fire-place, two or three four-pronged stools of wood, sundry blanket rugs and robes, made up the furniture of the apartment. Furnishings and all, it differed not from hundreds of its kind throughout the pueblo, save that conspicuous in one corner was the governor's staff of office,—a silver-knobbed ebony cane, suspended by a faded red ribbon, a present to the tribe, as I afterward learned, from President Lincoln. I did not observe, until I had thrown myself into the hammock, that between the rafters and staves over the center of the room were some beautifully painted and plumed sticks, the guardian gods and goddesses of the household.

As night approached I tried to build a fire and cook supper, but I made but sorry work of it. Unsavory fumes rose from my badly burned bacon, and presently the governor's face appeared at one of the openings in the roof. He regarded operations silently a minute, and then vanished. Soon he followed his feet down the ladder, approached the fire-place, and without a word shoved me aside. Taking my skillet he marched down to the river. When he returned, every trace of the odious bacon had been removed, and replaced by a liberal quantity of mutton and abundant suet. Poking up the fire, the old

fellow dexterously cooked the contents brown. Then, placing skillet and all in the center of the floor, he hastened away, soon to return with a tray of curious paper bread in one hand, while in the other, to my surprise, he held a steaming pot of thoroughly boiled coffee.

"Hamon no bueno," he remarked. "Este k'ók-shi, í-tâ," he added; from which amalgamation of Spanish and Zuni, augmented by suggestive gesticulation, I inferred that he regarded bacon as vile, but Zuni food prepared in Zuni fashion as worthy of emphatic recommendation. He did all this after the manner of a man who was performing an unpleasant duty, and when by gesture and incoherent Spanish phrases I expressed my gratitude most extravagantly he merely nodded his head, climbed the ladder, and remarked in Spanish, "Poor fellow," as he disappeared through the sky-hole as before. He probably commiserated me, for I was awakened next morning at the peep of day by the sound of breaking sticks, and turning over in my hammock saw the old fellow busily engaged in preparing a breakfast for me. Nor did he, throughout my long stay among the Zuñis, ever willingly permit me to prepare another meal.

I soon became better acquainted with the domestic life of the Zuñis, and learned where the governor went when he vanished through the sky-hole. His wife's family lived in the second story. There a room much wider than the one below, though not quite so long, accommodated all of them. A large beam through the center gave additional support to the rafters. Against it I struck my head the first time I entered, and, for that matter, nearly every time. I verily believe the Indians, though amused by this, sympathized with me so much that they were kinder than they otherwise would have been. Especially was this the case with the old chief's younger brother,—a constant visitor, himself taller than most of them,—who frequently experienced my difficulty, swearing the explosive oaths of his mother tongue with rare and increasing vehemence with every added experience. Indeed, a bond of sympathy thus arose between us. He soon realized that "Oh!" in American meant "Ai-ii," in Zuñi, and that "Damn" represented "Tuh!" He became morally—or immorally—even more certain, for he occasionally alternated the two expressions, or combined them with more presence of mind than I could have commanded under like circumstances.

The family consisted of the governor's ugly wife, a short-statured, large-mouthed, slant-eyed, bushy-haired hypochondriac, yet the soul of obedience to her husband, and ultimately of kindness to me, for she conceived a violent fancy for me, because I petted her noisy, dirty, and adored little niece. Not so was her old aunt, a fine-looking, straight little old woman of sixty winters, which had bleached her abundant hair as white as snow. She would stand half an hour at a time before me in the middle of the floor, holding the little girl in a blanket on her back, and varying her snatches of lullaby with sighs, meanwhile regarding me with large eyes and half-moon shaped mouth, as though I were a wizard, or a persistent nightmare. The governor did not love her. He called her "Old Ten," which, as he explained after I began to pick up Zuñi and his regards, referred to the number of men she had jilted, and which appellation, when judiciously employed, usually brought hot tears from the old lady's eyes, or unloosed a tongue that the governor avowed "knew how to talk smarting words."

Then there was the governor's brother-in-law, a short, rather thick and greasy man, excessively conceited, ignorant, narrow, and moreover, so ceaselessly talkative, that he merited the name the inventive and sarcastic chief had given him, "Who-talks-himself-

dry." I have known him, while dressing in the morning (usually a short process with the Zuñi), to forget, in the ardor of some new scandal, the most important articles of apparel, and issue forth from his couch of skins and robes, very like a half-picked chicken, still talking, and blissfully unaware of his dutifully uncriticised condition.

If the governor loved not "Old Ten," he despised her favorite nephew. This fellow's wife, however, was good-looking, dignified, quiet, modest, and altogether one of the most even-tempered women, red or white, it has been my lot to know. She was always busy with her children, or with the meal-grinding and cookery, occasionally varying these duties with belt-making or weaving. The little niece and her older brother were the only children. The former was a little child, rather too small for her age, bright-eyed, slant-headed like her father, and at once pursy and dirty with abundant food. Though she could not speak plainly, she even thus early gave promise of her father's character, in her ability to make much noise. She was the small "head of the household." All matters, however important, had to be calculated with reference to her. If she slept, the household duties had to be performed on tiptoe, or suspended. If she woke and howled, the mother or aunt would have to hold her, while "Old Ten" procured something bright-colored and waved it frantically before her. If she spoke, the whole family must be silent as the tomb, or else bear the indignation of three women and one man. The governor despised the father too much to join in this family worship. Indeed, while the rest delighted in speaking of this short specimen of humanity by the womanly name of "*Iu-i-si-a-wih-si-wih-ti-tsa*," the governor called her a "bag of hard howls," and said that she had the habit of storing up breath like a horned toad, which accounted for her extraordinary circumference, and her ability to make a noise in the world.

Little *Iú-ní*, her brother, was as handsome and as nearly like his mother as boy could be, save that he was rather inconsiderate to dumb things, and to his little sister's hideous dolls.

The aged grandfather of this group was usually absent after wood, or else puttering near the fire-place, or on the sunny terrace, with bits of raw hide, strands of buckskin, or head-scratching. He was lean as Disease, and black as his daughter—which expressed a good deal to her husband, the governor,—with toothless under-jaw and weeping eyes. The Navajos had treated him roughly in his youth, which he showed by the odd mixture of limp, shuffle, and jump in his gait. The

COOKING BREAKFAST.

asthma had tried for years to kill him; but he only coughed and wheezed harder and harder, as winter succeeded winter. So explained his son-in-law, the governor, who, if he ever mentioned him at all, called him "the Ancient Hummer" (*U-mumu-thli-shi-kia*)—or, to translate into news-boy slang, "Old Buster."

There were two unmarried members of the house; a nephew and an adopted girl. The nephew was an over-grown, heavy-faced, thick-lipped, yellow-haired, blue-eyed blonde,—a specimen of the tribal albinism, a dandy, and the darling of the white-haired "Old Ten." One day, after I had presented the latter with a pane of ruined negative glass, she ventured to compare her favorite with me. My flattering acknowledgments of this compliment made decided winnings of the old woman's hitherto restrained affections. The governor spared this youth no more than the others. With characteristic irony, he called him "The Family Milkman," or "The Night Bird," the latter term referring to his eyes, "which," the governor usually added, "wiggled like those of an owl in strong sunlight." The maiden was jolly, pretty, and coquettish—the belle of "Riverside street." Her lovers were many, but soon, of the long row who waited under the moonlit eaves, only one was admitted—the governor's younger brother, my sympathetic friend. There was but one room in the house in which the two could hope to be left

to themselves—mine. Here they came night after night. They paid no attention to the lonely *Mé-lik* in his hammock, but sat opposite in the darkness on the low adobe bench, hour after hour, stroking each other's hands, giggling and cooing in low tones just like so many of my own people of the same age, only in a different language. An occasional smack, followed by feminine indignation, taught me the meaning of "Stop that!" in Zuni, and the peculiarities of the Pueblo kiss. If the blissful pair remained too late, the slab door would rumble on its wooden hinges, and the governor, preceded by a lighted torch of cedar splints, would stalk in, and, as near as I could make out, rate the young man soundly for his want of respect to the *Wash-intona Me-li-kana*, whereupon the pair would vanish, the maiden giggling and the young man cursing.

I made fair progress in the good graces of this odd group, but still by them, as by the rest of the tribe, I was regarded as a sort of black sheep on account of my sketching and note-taking, and suspicions seemed to increase in proportion to the evident liking they began to have for me. Day after day, night after night, they followed me about the pueblo, or gathered in my room. I soon realized that they were systematically watching me. They were however, pleasant about it, and constantly taught me Mexican and Indian words, so that I soon became able to carry on a con-

versation with them. My apparent estrangement from the other members of our party aroused in some of them sympathy, in others only additional suspicions. It thus happened that the Indians began to watch me still more strictly, not only by day, but throughout whole nights. No matter how late I lay in the corner of my room, writing, the governor always sat beside me. Not until the last word had been written and I was stretched out in my hammock would he leave. Nor was I even then by myself, for either the governor, or, when he was absent, some one of his relatives or sub-chiefs, slept across the doorway of the room.

Realizing that until I could overcome the suspicion and secure the full confidence of the Indians, it would be impossible to gain any knowledge of importance regarding their inner life, I determined to remain among them until the return of our party from Moqui, whither it was soon to go. It was, therefore with feelings akin to those of a doomed exile that I watched the busy preparations one evening for the departure. This feeling was heightened by the fact that I was by no means intimate with the missionary, and Mr. Graham, the trader, was then temporarily absent from the pueblo. Moreover, I received from most of my party little sympathy in my self-imposed undertaking.

Next morning, when at sunrise I started toward the mission to bid them good-bye, a glance at the distant corral showed that they had all gone; and as I strained my eyes to catch a glimpse of them, the last white-topped wagon of the train disappeared over the far-off lava hills whence I had first caught sight of the Valley of Zuñi.

It had been arranged that my provisions should be left with the missionary. When I applied to him that dreary morning for my coffee, sugar, flour, and other necessities, he simply replied that he had nothing for me; that the things the Colonel had left were designed for himself. It was with the most gloomy forebodings that I turned toward the pueblo. As I passed along the western end of the town the Indians watched me and commented on my sadness, but several of them assured me that "Zuñi was a good place to live in. So long as one had plenty to eat, why should he feel sad?" I entered my lonely room, and sat down in the hammock, burying my face in my hands. I heard no moccasin footstep, but when I roused up again the old governor was standing before me.

"Why is our little brother sad?" he asked.

"Alas!" I replied, "my friends are all gone, and they have left me nothing."

He looked at me a moment and said, "Little brother, you may be a Washington man, but it seems you are very poor. Now, if you do as we tell you, and will only make up your mind to be a Zuñi, you shall be rich, for you shall have fathers and mothers, brothers and sisters, and the best food in the world. But if you do not do as we tell you, you will be very, very, very poor, indeed."

"Why should I not be a Zuñi?" I replied in despair; and the old man quickly answered, "Why not?"

Leaving me for a few minutes, he soon returned with a steaming bowl of boiled mutton, followed by his kindly old wife, bearing a tray of corn-cakes mixed with *chili* and sliced beef, which, wrapped in husks, had been boiled like meat dumplings.

"There, try that," said the old man, as he placed the bowl in the center of the floor. "Fill your stomach, and your face will brighten."

And the old woman stood admiringly by as I heartily ate my first genuine Zuñi meal.

Although kinder than ever, the governor continued just as faithfully his nightly vigils. One night, after sitting close beside me examining every word I wrote, he threw away his cigarette, and informed me that "it was not well for me to make any more marks on the paper—it was of no use." As I calmly persisted, the next night a grave council was held. It was in the same room, and as I lay in my hammock listening to the proceedings, the discussion grew louder and more and more excited, the subjects evidently being my papers and myself.

When at a late hour the council broke up, the governor approached me, candle in hand, and intently regarded my face for several minutes. He then said:

"The *Ked-k'ok-shi* (Sacred Dance) is coming to-morrow. What think you?"

"I think it will rain."

"And I think," said he, as he set his mouth and glared at me with his black eyes, "that you will not see the *Ked-k'ok-shi* when it comes to-morrow."

"I think I *shall*," was my reply.

Next morning before I was awake, the herald and two or three *tinieutes* had come in, and, as I arose, were sitting along the side of the house. The old head chief had just prepared my morning meal, and gone out after something. I greeted all pleasantly and sat down to eat. Before I had half finished I heard the rattle and drum of the coming dance. I hastily jumped up, took my leather book-pouch from the antlers, and strapping it

THE DANCE OF THE GREAT KNIFE.

across my shoulder, started for the door. Two of the chiefs rushed ahead of me, caught me by the arms, and quietly remarked that it would be well for me to finish my breakfast. I asked them if the dance was coming. They said they didn't know. I replied that I did, and that I was going out to see it.

"Leave your books and pencils behind, then," said they.

"No, I must carry them wherever I go."

"If you put the shadows of the great dance down on the leaves of your books to-day, we shall cut them to pieces," they threatened.

Suddenly wrenching away from them, I pulled a knife out from the bottom of my pouch, and, bracing up against the wall, brandished it, and said that whatever hand grabbed my arm again would be cut off, that

whoever cut my books to pieces would only cut himself to pieces with my knife. It was a doubtful game of bluff, but the chiefs fell back a little, and I darted through the door. Although they followed me throughout the whole day, they did not again offer to molest me, but the people gathered so closely around me that I could scarcely find opportunity for sketching.

As the month of November approached, the cold rains began to fall. Frost destroyed the corn-plants and vines. Ice formed over the river by night to linger a little while in the morning, then be chased away by the midday sun. Not in the least did these fore-runners of a severe winter cause the dance ceremonials to abate. The Indians were, to some extent, reassured, when, on the occasion

of the next dance, which happened to be a repetition of the first, I did little or no sketching. At another dance, however, I resumed the hated practice, which made matters worse than before. A second council was called. Of this, however, I knew nothing, until afterward told by the old chief. It seems that it was a secret. It discussed various plans for either disposing of me, or compelling me to desist. Among others was the proposal that I be thrown off the great mesa, as were the two "children of the angry waters,"\* but it was urged that should this be done, "*Wa-sin-to-na*" might visit my death on the whole nation. In order to avoid this difficulty, others suggested that I be *há-thli-kwísh-k'ia* (condemned of sorcery) and executed. They claimed that sorcery was such a heinous crime that my execution would be pardoned, if represented to the Americans as the consequence of it. But some of the councilors reminded the others that the Americans had no sorcerers among them, and were ignorant of witchcraft.

At last a plan was hit upon which the simple natives thought would free them from all their perplexities. Surely, no objection could be offered to the "death of a Navajo."† Forthwith the Knife Dance was ordered, as it was thought possible that the appearance of this dance would be sufficient to intimidate me, without recourse to additional violence.

One morning thereafter, the old chief appeared graver and more affectionate toward me than usual. He told me the "*Ho-mah-tchi*" was coming,—a very *sa-mu* (ill-natured) dance," and suggested that "it would be well for me not to sketch it." Unaware either of the council or of the functions of the angry dance, I persisted. The old man, a little vexed, exclaimed, "Oh, well, of course, a fool always makes a fool of himself." But he said no more, and I assigned, as the cause of his remarks, superstitious reasons, rather than any solicitude for my safety.

When the great dance appeared, the governor seemed desirous of keeping me at home. During most of the morning I humored him in this. At last, however, fearing I would miss some important ceremonial, I stole out across the house-tops and took a position on one of the terraces of the dance court.

The dancers filed in through the covered

way, preceded by a priest, and arranged themselves in a line across the court. Their costumes were not unlike those of the first dance I had witnessed, save that the masks were flatter and smeared with blood, and the beards and hair were long and streaming. In their right hands the performers carried huge, leaf-shaped, blood-stained knives of stone, which, during the movements of the dance, they brandished wildly in the air, in time and accompaniment to their wild song and regular steps, often pointing them toward me.

As the day advanced, spectators began to throng the terraces and court, few, however, approaching to where I was sitting; and the masked clowns made their appearance.

I had been busy with memoranda and had succeeded in sketching three or four of the costumes, when there dashed into the court two remarkable characters. Their bodies, nude save for short breech-clouts, were painted with ashes. Skull-caps, tufted with split corn-husks, and heavy streaks of black under their eyes and over their mouths, gave them a most ghastly and ferocious appearance. Each wore around his neck a short, twisted rope of black fiber, and each was armed with a war-club or ladder-round.

A brief intermission in the dance was the signal for a loud and excited harangue on the part of the two, which, at first greeted with laughter, was soon received with absolute silence, even by the children. Soon they began to point wildly at me with their clubs. Unable as I was to understand all they had been saying, I at first regarded it all as a joke, like those of the *Keó-yi-moshi*, until one shouted out to the other, "Kill him! kill him!" and the women and children excitedly rising rushed for the doorways or gathered closer to one another. Instantly, the larger one approached the ladder near the top of which I sat, brandishing his war-club at me. Savagely striking the rounds and poles, he began to ascend. A few Indians had collected behind me, and a host of them stood all around in front. Therefore, I realized that in case of violence, escape would be impossible.

I forced a laugh, quickly drew my hunting-knife from the bottom of the pouch, waved it two or three times in the air so that it flashed in the sunlight, and laid it conspicuously in front of me. Still smiling, I carefully placed my book—open—by the side of the pouch and laid a stone on it to show that I intended to resume the sketching. Then I half rose, clinging to the ladder-pole with one hand, and holding the other in readiness to clutch the knife. The one below suddenly grabbed the skirt of the other and shouted,

\* A beautiful bit of folk-lore concerning *Tá-ai-yá-lon-ne*, or Thunder Mountain, and the deluge of the land of Zuñi.

† Figurative expression for any sacrifice of life, either animal or human, at the *Ho-mah-tchi*, or Great Knife Dance and ceremonial,—the ancient war *Ká-ka* of the Zuñis.

"Hold on, he is a *ki-he*! a *ki-he*!\* We have been mistaken. This is 'no Navajo.'" Jumping down to the ground, the one thus addressed glanced up at me for an instant, waved his war-club in the air, breathed from it, and echoed the words of his companion, while the spectators wildly shouted applause. The two held a hurried conference. They swore they must "kill a Navajo," and dashed through the crowd and passage-way out of the court.

The *Ké-yi-mo-shi*, freed from their restraint, rushed about with incessant jabber, and turned their warty eyes constantly in my direction. As I replaced my knife and resumed the sketching, the eyes of nearly the whole assemblage were turned toward me, and the applause, mingled with loud remarks, was redoubled. Some of the old men even came up and patted me on the head, or breathed on my hands and from their own.

Presently a prolonged howl outside the court attracted the attention of all, and the frantic pair rushed in through the covered way, dragging by the tail and hind legs a big, yelping, snapping, shaggy yellow dog. "We have found a Navajo," exclaimed one, as they threw the dog violently against the ground. While he was cringing before them, they began an erratic dance, wildly gesticulating and brandishing their clubs,

\* *Ki-he* is an archaic term for "friend." It is now used to signify a spiritual friend, or one who is endowed with sacred powers for the good of mankind, — a spiritual friend to the *Kâ-kâ*.

and interjecting their snatches of song with short speeches. Suddenly, one of them struck the brute across the muzzle with his war-club, and a well-directed blow from the other broke its back. While it was yet gasping and struggling, the smaller one of the two rushed about frantically, yelling, "A knife, a knife." One was thrown down to him. Snatching it up, he grabbed the animal and made a gash in its viscera. The scene which followed was too disgusting for description. It finds parallel only in some of the war ceremonials of the Aztecs, or in the animal sacrifices of the savages of the far North-west. Let it suffice that what remained of the dog at sunset, when the dance ended, was reluctantly given over to its former owner by the hideous pair.†

Whether the Indians had really designed to murder me, or merely to intimidate me, my coolness, as well as my waving of the knife toward the sun, both largely accidental, had made a great impression on them. For never afterward was I molested to any serious extent in attempting to make notes and sketches.

That night, the old chief was profuse in his congratulations and words of praise. I had completed in him, that day, the winning of the truest of friends; and by so doing had decided the fate of my mission among the Zuñi Indians.

† I have since learned that the two, whom I now know very well, belonged to a secret order, members of which are obliged on such occasions to go through this horrible ceremonial.

## THE LED-HORSE CLAIM.

A ROMANCE OF THE SILVER MINES.

BY MARY HALLOCK FOOTE,

Author of "Friend Barton's Concern," "A Story of the Dry Season," etc.

V.

### A PHILOSOPHER OF THE CAMP.

As Hilgard stepped into the street, his brown mare, Peggy, swung around from the hitching-post, and whinnied to him impatiently. He patted her neck and rubbed her soft nose, to console her for her disappointment, and then, crossing the street, ran up a dark flight of stairs to Godfrey's lodging.

He found the Doctor asleep in his arm-chair before an air-tight stove that showed a red glow at its draught. The ashes of his cold pipe were scattered over the ample bosom of his dressing-gown, and a book had slipped to the floor beside him.

"Eh! what?" he exclaimed, querulously, arousing himself and feeling for a black silk cap that had dropped from the bald spot on the top of his reclining head. "Is that you, George? How did you get in?"

"I saw a light under your door and heard you snoring, so I came in; the door was unlocked."

"I snoring! Nonsense! I never uncloze my lips when I sleep! What you heard was the roaring of the draught. Open that door, it's very warm in here!"

Godfrey leaned forward and closed the draught, then stretched himself back in his chair again, with a more benignant expression.

"Come, sit down, boy. Aren't your long legs tired enough yet, but you must go prowling about the room like that? You'll give me a crick in my neck, trying to see you over my shoulder."

Hilgard sat down on a low chair which brought his chin very close to his knees; he rested his crossed arms on them and his chin on his arms, fixing his black-brown eyes on a crack in the stove through which he could watch the subsiding gleam of the fire.

"I hope you will sleep as well after your dance as I did after my supper," Godfrey remarked. His tone carried with it a certain perception of some mood in his young companion which might call for less careless handling than characterized their usual intercourse. "It strikes me it's time you were in

search of a bed somewhere. Did you come here to share mine?"

"No, Doctor—the fact is, you did me a tremendous favor to-night."

"I rather suspected as much," the Doctor assented, with a melancholy smile. He did not look at Hilgard, but kept his eyes on the stove. "George, I hope my pride in you isn't going to have a fall."

"I hope not, Doctor," said Hilgard, indifferently; "but you had better put your pride in a safer place."

"I've gloried in your tough-heartedness where woman is concerned, more than I have in my own philosophy—eh?" added the Doctor, in reply to some inarticulate comment from Hilgard.

"With about as much reason, perhaps," George repeated.

"Don't be flippant, boy. It's a pity you can't take a lesson in the old man's philosophy, that you make light of at your own expense. Learn to inhale the delicate bouquet and leave the wine alone, as I did at Archer's to-night."

The Doctor performed a fastidious gesture of lifting a fragile glass to his superior sense, closing his eyes in an ecstasy of appreciation.

"By the way," he went on, as Hilgard watched him, a hot impatience struggling with his usual enjoyment of the old boy's admonitions, "Wilkinson thinks he knows a good wine; perhaps he does; but if he does, then I don't! There isn't a wine in the place!"

He appeared to have lost the thread of his anxieties regarding the perilous state of Hilgard's emotional nature; but he presently returned to it, leaning back in his chair and closing his eyes, as having no one in view.

"All girls are pretty much alike when you get twenty or thirty years away from them—'The brightest eyes that ever have shone,' you know,—what the deuce is the rest of it? I can't remember any poetry that I've read since I was ten years old. It's the essence a man wants in his life, not the individual flower; however, at your age I took a more specific view of flowers; I didn't object to one in my button-hole now and then."

"For Heaven's sake, hold on, Doctor!" Hilgard interrupted.

Godfrey put out a deprecating hand.

"Sit down, my boy, sit down. I understand you perfectly—no harm has been done so far. Your young legs ached for a dance with a pretty girl. Say a pretty girl—I don't insist on your dancing with more than one girl at once—whom you may never see again, and my chastened spirit yearned for an admirable supper. If I let my knowledge of young blood lead me into some foolish forebodings as to the future, why that isn't to say that you're bound to justify them. Only, mark you, if you ever do get into trouble, come to me, boy, come to me! I've got plenty of storage room in here" (he gave the red bosom of his dressing-gown a sounding slap) "for other people's secrets. My own are in a safer place—in the grave."

Under the old boy's mannerisms of speech, and the whimsical play of his features, now growing a little heavy in their mobility, there was an accent of tenderness which touched the young man's heart.

The Doctor had been funny so many years that his nearest friends always treated his serious moments as the most triumphant of his jests. Hilgard, the boy of his recent fancy, understood him better than his oldest comrades, who had witnessed his slow deterioration through twenty-six years of frontier life, and that series of postponed successes, roughly characterized by the world as failures, which had robbed him gradually of his youthful prestige among them. The Doctor's secrets were not all in the grave. Notwithstanding his frequent, dramatic allusions to them, and his exaggerated frankness about all his affairs, past and present, the saddest of all his secrets still walked the earth, bearing his tarnished name. Very few of the friends were still about him who knew the story of his disastrous marriage. He had accepted the consequences of his mistake with uncomplaining manliness, but he had his lonely hours,—his moments of bitterness, when the passionate, wasted love of his youth came back to mock the careless stoicism of his middle-age.

It was said of the Doctor that he was lazy, unambitious, and given to levity. A pervading seediness had crept over his outward man. The moth of long isolation from gentle communications had corrupted his good manners, and the thief of discouragement had stolen his pride. He sometimes consorted with the halt and the maimed in reputation; he did not always avoid the dark-colored sheep of the camp; but he was never known to be the companion of its birds of prey.

Hilgard was the only one of his acquaint-

ance, perhaps, for whom he had any affection, who was not broken-winged, or weighted with some disability of character or fortune. His remnant of self-respect showed itself in his avoidance of the prosperous and flagrantly happy. He neither attempted to discount their successes, nor to share them; but for Hilgard, on the threshold of the fight, in his unstained armor and unquenched ardor of life, he felt all the yearning of a woman, with the doubts and fears of a disappointed man. This feeling expressed itself chiefly in jibes and grimaces of speech, which passed current between them much more easily than sentiments would have done.

"Your friend, Mrs. Denny," Hilgard began after a silence, "in that delicate, arch little way of hers intimated that Conrath had been drinking when he came in to-night. Is it a habit with him, do you know?"

"No, hardly a habit, as yet; a predilection, perhaps. It's a bad climate for predilections of that kind."

"Do you suppose he—his sister has ever seen him in that way?"

"Heaven forbid! No, to do Con justice, he keeps himself out of the way when his little predilection has got the upper hand of him. He has 'important business down town.' Women have a great respect for that. I've known Con's affairs to be so absorbing as to keep him secluded for twenty-four hours at a time—trouble with the smelters, and what not."

"Miserable, brutal business!" Hilgard exclaimed, rising to his feet with a gesture expressive of the general futility of things. "Why is it that men who don't know how to take decent care of a horse, always have some woman at their mercy?"

"Why, indeed, my boy, when chivalrous hearts like yours and mine haven't so much as a rag of a favor to stick in our caps!"

"What infernal selfishness to bring a girl like that out here, anyhow!" Hilgard went on, without noticing the reckless inconsistency of the Doctor's present attitude with regard to feminine favors.

"Well, you and I should be the last to complain of that. The influence of a nice girl in a place like this, provided, mind you," said the Doctor, endeavoring to recover himself, "that no attempt is made to sequester the same —"

"And look at the friends he picks out for her!" Hilgard interrupted passionately. "A rowdy little woman with a miscellaneous list of acquaintances —"

"Steady, my boy! If you mean Mrs. Denny,—I'm one of Mrs. Denny's acquaintances, myself! I knew her at Central before she was married. She was a bright-faced little

thing just out of school. Family came from Tennessee—broken up by the war. Just fancy a girl beginning the study of human nature in a mining camp—and her own nature in the bargain. She began with Denny. Are you listening to me, George? I suppose the only way for a woman really to know a man is for her to marry him. If that's true, in the course of an average life, with the greatest perseverance, she couldn't get very far in the noblest study of mankind, could she? Well, Mrs. Denny knows Denny pretty thoroughly, I suspect, by this time; and I daresay she's been surprised at a good many things she's found out in herself. Found herself doing and saying and thinking a good many things she never would have believed herself capable of when she was a young girl. She's a weak little vessel—the Lord knows what she was fashioned for; but it wasn't for Denny—that I'll take my oath to. The Lord never fashioned any woman for men like Denny. She used to be very musical in a chirrupy kind of way, but she doesn't sing any more—says she hasn't any instrument. If there's any music in that household, she's the instrument and Denny's the player. It's a wonder she isn't more out of tune. It makes a ghastly kind of music in a family when both have ceased to love, and one knows how to torture."

"Doctor," said Hilgard, "I wish you wouldn't!"

"Well, I wont—but you mustn't, either! Let her alone, poor little devil! She isn't the kind that rebels and sets up her own individuality. I don't suppose she ever had much to set up. She just wobbles along, leaning a little too far one way and then a little too far the other, and Denny prods her up to her place now and then."

"Doctor, what is the use of talking about it?"

"Well, I wont; only look here—why should you grudge her the company of a sweet young girl? If she can stand the contact, I should think the young girl might. Not that I'd pick her out myself to matronize a girl of mine; but Conrath likes a lively little duenna, you see. By the way, George,—Conrath doesn't seem to love you much. What's the reason?"

Hilgard looked uncomfortable.

"The reasons are underground—most of them?"

"Some scrape about your end lines, I hear ——"

"Yes."

"Well, that isn't all of it, is it?"

"Isn't that enough?"

"No, it isn't, in a camp like this. I've known men to pocket each other's ore, and fight it out, and be on joking terms with each

other, like's not, half the time. You're the one to feel ugly, it strikes me."

"Well, I do feel ugly."

"You don't feel as ugly as Con does, not by half. Come, I want to know what the trouble is?"

Hilgard turned red.

"Hang it all!" he said. "It's that little fool of a woman you are trying to make me sorry for! It began coming over the range. We made the trip from Fairplay together, Conrath and Mrs. D. and myself, and a lot more, shut up in that musty coach."

"You and Con made Mrs. Denny's acquaintance together, eh? Well, that was an unlucky conjunction."

"Oh, he knew her before, and I didn't want to know her ——"

"Ah!" said the Doctor. "I see! Well, it's a pity. Mrs. Denny is a little fool, but not an inch of anything more, George."

"I don't care what she is, if she will only keep out of my way."

"You mustn't take up too much room with that way of yours, my boy. It's a small world. A fellow with as broad shoulders as you've got can't go squaring them through it. We've got to turn out for the blind, and the lame, and the vicious. For your own sake, you'd better turn out for Conrath. He wont bear crowding. Give him plenty of room. I needn't tell you you'd better let his lady friends alone."

"I should think not, if you mean Mrs. Denny," Hilgard said fiercely, "Conrath's lady friends are not likely to be mine."

"Well, his lady relatives, then. The sister is very nice and very pretty, but she belongs to the Shoshone crowd. You'll find it enough to be mixed up with them in business, without any sentimental complication."

Hilgard rose to his feet and straightened himself while he buttoned his overcoat, looking down at Godfrey with an expression of intense annoyance.

"It's not her fault that she is Conrath's sister. Why should you not speak of her with as much respect as if she were yours or mine?"

"My dear boy, I wish she were your sister. I'm going up to the Shoshone to-morrow," Godfrey added presently. "I want to look at that girl again. I can easily have some business with Conrath. Besides, I owe her an apology in person for the waltz last night."

"You'd much better keep away. You'll go up there with a bee in your bonnet, and make yourself ridiculous. She has forgotten which of us she waltzed with, by this time."

Hilgard had got as far as the door, but stopped and began walking up and down the

shadowy part of the room while he expostulated with the Doctor.

"If you'll promise to keep away, I will," the latter called to him from the depths of his chair. "You are much safer and in better company with a ridiculous old fellow with a bee in his bonnet, than with any of that crowd. I say it again, whoever it offends!"

"Doctor, you're incorrigible! You are as bad as a dime novel. I could laugh, if you didn't make me so mad, at the wild absurdity and the cheek of you!"

"Well, 'some will laugh while others weep,'" said Godfrey, rubbing the black silk cap about, sleepily, on the top of his head. "Have you any idea how late it is? The respectable part of the camp has been in bed these two hours!"

Hilgard took no notice of this hint.

"Conrath can't be all rascal," he said, after a silence. "There must be a decent side to him if one could only get at it. How is that, Doctor, do you know?"

"I don't think he is a many-sided youth," Godfrey answered. "I've seen only two sides of him. Conrath when he has been drinking and Conrath when he hasn't. I haven't found either very attractive. He has never done anything yet, but I'm afraid when he cuts his wisdom teeth, he'll cut them in iniquity."

Hilgard continued his perambulations in silence. A smoldering stick fell in the stove, and the flames started up again with a dull roar.

"Con," said the Doctor—"no,—George,—don't you get too fraternally anxious about Conrath's sister." The Doctor's thoughts were evidently wandering. "Mrs. Denny's—little discrepancies—quite on the surface. Even—guileless observer like myself can perceive them." The words came lingeringly, with somnolent pauses. "I'm sorry, Con isn't better, boy,—for her sake—Cecil's sake—and yours."

The black silk cap fell off, as the wearer's head, sagging from side to side, dropped back against his chair; his hand, with the pipeful of cold ashes, sank lower and lower, and rested on its broad arm. Hilgard picked up the cap, and pressed it quietly on the defenseless crown, which, as the Doctor said, had "got above timber line."

"G' bless you, George. Go to bed, foolish boy!" the sleeper murmured.

self. He tried in vain to recall the face of the partner whom he had resigned, in a weak moment, to his favorite. He could only remember that she was young, with a sweet voice and fair, indefinite coloring. Surely there had been nothing about her that need have been irresistible, even to four-and-twenty. Reflecting, however, upon the position, relatively, of the two mines, and the dangers of propinquity and isolation combined, the Doctor resolved that he would take his threatened ride up to the Shoshone in the afternoon, and satisfy himself as to the potency of Miss Conrath's charms and the consequent extent of Hilgard's peril.

He inquired for Conrath, and was not surprised to find that he was not at the mine. The Doctor had assured himself of that fact before leaving the camp. Miss Conrath was at home, however; on his asking to see her, the maid showed him into the long, bright room, with windows at both ends which served for all the social uses of the managerial establishment. The young lady looked up from her low seat by the hearth, in evident surprise, at his entrance.

She appeared to have been sitting a long time by the fire, for one cheek was quite hot and red, and her lips showed a dry, vivid brightness. She gave him a somewhat perfunctory welcome, as if, as a matter of course, he had come to see some one else.

He began to realize, with some uneasiness, that Conrath's sister was not quite such a child as he had thought her to be. But the Doctor had not the fear of woman, however young and fair, before his eyes. He referred at once to the ball, and to the waltz, with the unblushing protestation that his unavoidable rudeness had cost him his night's rest.

Miss Conrath was not pleased with her visitor, but she was willing to bear with him for civility's sake. She was curious about him, too.

She was looking a little heavy-eyed and feverish after the ball. She had slept ill at Mrs. Denny's, and had not been able to compose herself to rest since her early return to the mine. But as the Doctor looked at her he was more and more disgusted with his own fatuity of the night before.

He almost groaned as he studied her, and saw how more than pretty, how adorable, she was!

She sat somewhat listlessly engaged with a mass of soft white knitting she had unfolded from a silk handkerchief which she spread across her lap, while the Doctor discussed the chances of the railroad getting through to the camp before winter, and indulged in the usual revilings of the climate.

## VI.

### BOUNDARY MONUMENTS.

THE Doctor's apprehensions with regard to Hilgard survived the night and clouded his enjoyment of a late breakfast, cooked by him-

"Did you ever have the asthma, Miss Conrath?" he asked, pursuing this theme with variations.

"I don't remember that I ever did," Cecil laughed. She was able, as yet, to regard illness, connected with herself, as a kind of joke.

"Well, I dare say you never did. But then, you know, even babies have been known to have it. Well, this is the most marvelous climate for asthmatics—in fact, for any kind of chronic complaint. But I've observed these stimulating climates that stir old blood out of its torpor are the very—are a—all wrong for healthy youngsters. Young blood don't require a light atmosphere any more than it requires a whisky-and-soda—if you will excuse me—every morning before breakfast. I don't know, upon my soul, how else to account for the way all the young fellows go to the deuce out here."

Cecil looked up at her visitor in great surprise. She thought he might possibly be approaching the subject of a hospital or free reading-room, or course of lectures for young men, with a view to asking for contributions; but he did not look like an agent for a benevolent enterprise.

She was at a loss to understand the turn he had given to the conversation.

The Doctor certainly was taking a most extreme view of his duty in this situation, which he had found so much worse than could have been expected. There was no doubt as to Hilgard's symptoms. They had been of a nature calculated to shake far more than the Doctor's boasted faith in his tough-heartedness. He had no objection to the young lady. A perfect lamb, he said to himself, and yet with a spirit of her own in those steady gray eyes, under the wide low arch of the soft eyebrows. But she was allied to a masculine element in the camp, the nature of which the Doctor understood better than Hilgard. It was evident that his warnings had been thrown away on that headstrong youth. He must see what could be done with the fair Shoshone. There was no way left but to traduce Hilgard—blacken his character—deal with him remorselessly, and make her afraid of him. George might think the treatment of his symptoms a little rigorous, but he would live to be thankful for it. The Doctor would shrink from nothing, where the safety of his "boy" was concerned.

"He can talk about his dime novels," he soliloquized gloomily, "but the state of things here is not much better. It's mediæval,—that's what it is!"

"There's that young Hilgard," he began violently. As if the word had been a blow,

the color answered in the young girl's cheek. She had expected that name some time in the course of the conversation, but was not prepared for it in this connection. "George Hilgard was a perfect specimen of young manhood when he first came from the East; he was like Saul among his brethren."

The unhappy blush deepened until it had quite obliterated the fire-glow.

"I don't know what can have got into that boy, unless it's the altitude! He needs more atmospheric pressure—the more pounds to the square inch the better for a chap like that. I've been foolish enough to let in a sneaking kind of a fancy for that young limb, but, upon my soul, if he's got any friends in the East, they'd better send for him! They'd better get him out of this camp!"

The young girl looked steadily at her work without speaking, while a paleness about her lips spread slowly backward over her cheeks.

"I'm sure I don't know what time he got to bed last night! He came tramping up my stairs after midnight to talk over his troubles with me. I knew he was getting into some scrape or other! That boy has got to get out of the camp!"

The Doctor concluded from the victim's expression that he had gone far enough. He had not indeed intended to go quite so far, but the effort his words had cost him had given them an impetus which surprised himself. Miss Conrath's head was bent very low over her knitting, and the white wool slid over her fingers with a fitful, uncertain movement. He now proceeded calmly to give his remarks a more general tendency.

"That's a very pretty thing you're working on,—looks as white and soft as a fresh snow-fall. Hope it will keep white longer than the snow does that falls in this dusty camp."

With her needle between her tremulous fingers, Cecil held out the corners of the handkerchief.

"I keep it folded in this," she said.

"Ah, yes," the Doctor murmured abstractedly, "that's a good way, too! Ridiculous idea for an old fellow like me to be dwelling on; but if I had a young sister or daughter in this camp, I dare say I should be inclined to keep her as you keep your white wools—folded away from the dust."

He paused a moment, awaiting some comment from Miss Conrath. But none came; she took a long breath and rested her arms on her lap, looking down into the fire. The Doctor derived great satisfaction from her attitude, and the long sigh, as of one who rests a moment after pain.

She began to wince—poor little thing! He would give one more turn to the screw

and then let her breathe again. It was absolutely necessary that she and Hilgard should not be running across each other at balls, every fortnight or so. George would easily find means to reestablish himself in her eyes, if he had the chance. The Doctor would do what a devoted friend might, to deprive him of that chance.

"Now, that ball of the Younger Sons!" he went on; "they claim to be very exclusive, poor fellows! I'm one of them myself, so far as the name goes, but I don't pride myself on it. A Younger Son is no better than an older one,—sometimes not half so good. What did you think of the ball, Miss Conrath? Did it strike you as being very exclusive?"

Miss Conrath lifted her eyes a moment, but without looking at the Doctor.

"I do not think those who went to the ball are the ones to criticise it," she said.

"Surely not," the Doctor cordially assented; "but, on the other hand, those who did not go are hardly the ones! You and I have been, Miss Conrath—and, if I may judge by your expression, rather than your words, you find yourself not quite acclimated to the pitch of gayety required to enjoy a camp ball."

"My brother was not there, as I expected," Cecil protested.

"Ah, yes, of course that makes a difference; but it makes more difference here than it would anywhere else. Here there is no classification. You have to pick your way among all the people who are crowding you, elbow to elbow. What is a young girl to do? You are no judge of character, Miss Conrath. I hope you are not, at your age. You are perfectly defenseless here, the moment you get outside your door. So is any young girl."

Miss Conrath rose suddenly, as if her endurance had reached a limit.

"It is true," she said, "I must be defenceless, when strangers give themselves the right to take my brother's place—and in his own house."

The Doctor rose, too, smiling at her with invincible composure. He was well satisfied with the effect of his desperate measures. To make all sure for the future he would not spare the final blow.

"Neither Hilgard nor I dared to be perfectly frank with you about that exchange of partners last night. Shall I make a clean breast of it and tell you the facts?" he asked.

Cecil faced him, her soft eyes expanded with a pained brightness.

"I will hear nothing more—you have been too frank already," she exclaimed, indignantly. "Please to have some regard for me, if you have none for your friend. I have

heard things to Mr. Hilgard's discredit from others who did not profess to like him, but it is his friend who has no mercy on his character, and no respect for his confidence."

The Doctor was instantly and mightily roused at the thought of these "others," less disinterested detractors, at work upon Hilgard's character. His was the only hand that could be trusted to administer the blackening touches, and even his began to tremble remorsefully at the picture he had faintly sketched of his boy, a prey to the cheap temptations of the camp. He sat down again, bent on investigating this unexpected aid which had anticipated him in the work of defamation.

"I should like to know," he burst forth, "who has been warning you against George Hilgard! Perhaps your brother has been enlarging on him for your benefit. You needn't pay the least attention to that sort of thing. Your brother and Hilgard are engaged just now in a discussion of their boundary lines. Half the mines in the camp are doing the same thing; their opinion of each other is likely to be more picturesque than edifying. What has your brother got to say about Hilgard?"

"I did not mention my brother's name!"

"Of course you haven't. You appear to have more sense than most girls; but you may take my word for it, Miss Conrath, that when you hear anything to the discredit of George Hilgard, it's invented by the person who brings it to you, I don't care who it is! Of course, your brother has got to keep Hilgard at a distance. The chief of the Led-Horse can't be chasséing back and forth across the gulch with the sister of the Shoshone! You can't be putting a man's ore in your pocket with one hand and asking him to dinner with the other."

"Mr. Godfrey!"

"Oh, I know I'm in your brother's house. I'm only expressing the general sentiment down in the camp. I don't know anything about their squabbles! I only know that George Hilgard's the finest young fellow in this camp. He'd be one of the ten who would save the city, if we could find the other nine!"

"I don't know who you are defending him from. You yourself have said the worst things," Cecil repeated.

"What have I said? I said he was in trouble. So he is! So he is! Or if he isn't, he's in a fair way for it. It's easy enough to see the beginning,"—he looked menacingly at the bewildered girl—"but there is no telling where it will end! I've done what I could. There's not a young fellow living for whom I'd

have done what I've done for him to-day! But I give it up!" The Doctor spread out both his palms with a hopeless gesture.

Cecil began to feel a little afraid of her eccentric visitor, who did not seem to be out of his mind, nor yet altogether in it. She was troubled by a suspicion that he must have some motive for his grotesque outburst of confidence with regard to Hilgard. She could hardly take it as a wanton impertinence toward herself.

"I must ask you to excuse me from any more discussion of your friend. What he is or is not cannot concern me. My brother will be at home soon, I think, if you like to wait for him."

She felt that her discourtesy had been well-deserved, and, without further apology, she left the room.

The Doctor remained sitting for some time alone; he looked down at the prints of his dusty feet on the carpet, then at the heap of white knitting the girl had dropped. "Well! if women aren't the very——"

At that moment the maid entered with a jingling tray of glass and silver, which she proceeded to arrange on the sideboard at the farther end of the room. The Doctor took out a card and scribbled a few words on it.

"Will you give this to Miss Conrath?" he said, handing it to the maid. The words were:

*"Forgive me if I have made you uncomfortable. You need not remember anything I have said. Any inconsistencies you may have noticed in my remarks, I will commend to your charity for an old fellow who was kept up much too late the night before!"*

The Doctor was obliged to confess to himself, as he rode back to the camp, that the four dollars he had spent that afternoon for horse-hire was entirely thrown away, so far as it was ever likely to benefit Hilgard.

"It all comes of the missionary spirit," he grumbled to himself. "A man never goes out with that spirit on him, that he isn't sure to poke himself into some place where he's no business to be."

After sunset of the same day, Cecil Conrath was walking back and forth on the hill-side above the gulch, following an unfrequented trail, screened by the quaking-aspens from view on the side of the Led-Horse, and sheltered from the winds by the crest of the hill. The miners, observing that the young girl often walked here alone, had, with tacit courtesy, left this trail to her exclusive use.

To-day she ventured farther than usual into the gulch, attracted by the flutter of a red flag among the parting leafage. It was planted in the center of a clump of young trees, aspens of larger growth, and slender,

branchless pines, growing in the bottom of the gulch. The ominous signal, awaiting some unknown issue in this lonely spot on the debatable ground between the two mines gave Cecil a curious shock of apprehension. The air was full of rumors of incipient trouble. The situation had never been explained to her; she knew that Hilgard was the accuser and her brother the defendant, and that the affairs of the accuser were at a low ebb, while those of the defendant prospered again; more than this, she had only her forebodings, which had not been allayed by the tone her brother invariably used in speaking of his neighbor.

Venturing nearer, she saw that the trees which stood around the signal flag were each defaced by the hacking of a large piece of bark from the trunk, and bore an inscription deeply cut in the white, exposed wood. The leafy covert, where the shadows, stealing down between the hills, made an early dusk, might well have served for a trysting-place; but these were no amorous records which the young girl deciphered, as she went from tree to tree, tracing the rude intaglio; unless, indeed, the lovers had concealed their mutual vows under an arithmetical formula.

The red flag drooped in the failing breeze. Cecil now observed that it was planted between two narrow, flat stones, partly driven into the ground, side by side; the stones bore the same mysterious formulæ with which the tree-trunks were branded.

What had happened in this secluded spot, with these young trees standing about like mute witnesses, each bearing its scar for a token; and what coming event was this red signal beckoning on?

She heard a man's footsteps striding rapidly down the trail behind her; she waited under the blazed trees until they should pass. They did not pass, but came near and paused, and Hilgard's voice, low, and a little disturbed by rapid heart-beats, gave her "Good evening."

"Is it very strange for me to be here?" she asked, instinctively summoning him to her own defense. "I never come down into the gulch; but I saw this flag from the hill. I could not think what it meant!"

His presence had changed her unaccountable panic into a definable dread lest, when she looked in his face she should see there records, unobserved before, of that deterioration, or capacity for it, which Mr. Godfrey had ruthlessly depicted and then recklessly denied. She lifted her eyes doubtfully to his.

As if he felt the subtle question in them, his own met hers with their manly answer. It was enough, and more than enough. She had not asked for all the assurances that she read in his eyes.

"It is altogether so very strange here," she said, looking about restively at the encircling trees.

"Has anything frightened you, or troubled you?"

"Oh, no—it is only the place. Why are the trees all cut and marked, and these little stones? What has happened here? Do you know?"

Hilgard could not forbear a smile.

"Only a very little thing happened here a year and a half ago. The south-west corner of the Led Horse and the south-east corner of the Shoshone were located here. The end lines of the two claims are identical. These stones are the corner monuments, and the number of the corner and of the official survey are marked on them and on the trees. Did it seem so very mysterious to you?"

"I thought these stones marked the grave of some one buried here."

"The graves of a good many fortunes are marked by such stones as these. But they do not usually mean anything more tragic."

"And what does this flag mean?"

"It has been used for a survey that was made to-day along the line. The flag was placed here for what is called a 'back-sight,' to insure keeping the line ahead straight."

"Then it does not mean danger of any kind?"

"I hope not, I am sure," Hilgard replied. "Are you a little sensitive, perhaps, about danger?" he added, smiling.

"When one is alone a good deal one is apt to get morbid," she admitted.

He looked at her wistfully, thinking of his own loneliness, which he had not been conscious of until she became his neighbor.

"And the direction one's morbidness takes depends on temperament, I suppose. My morbidness takes the direction of various kinds of happiness I might have, but never expect to," he said.

"I should think you might be quite happy in your little kingdom over there." Her clear accents struck like perfect music on the stillness.

"You will have a kingdom of your own some day. I hope you will like it better than I do mine."

She turned her cheek toward him, with a pretty little movement of attention, but without looking at him.

"Will you tell me if I am on our side of the 'line'?" she asked.

"The Shoshone side, do you mean?"

"Yes, of course."

He came a few steps nearer to her. "Now we are both on the Shoshone side; you will let me stay on your side a moment, will you not?"

"But is that surveyor looking at the flag now?" she exclaimed, with a sudden accent of alarm at the thought of a mathematical instrument which might be of the nature of a telescope brought to bear on her under the present circumstances.

Hilgard reassured her by pulling up the "back-sight" and tossing it on the ground. The survey had been finished an hour ago, he explained; he had happened to remember the flag in passing, and had come to fetch it away.

She turned now toward the upward trail; but Hilgard, walking at her side, besought her to give him a few moments more.

"Am I never to see you," he asked,—"as other people see you,—as I might see you anywhere but here? Why may I not walk with you now, up the hill to your brother's house? There is no personal feeling on my part, in this unpleasant business between the mines. You have heard of it, of course, but it need be only a business disagreement. Your brother and I should not be enemies!"

She had stopped as he overtook her, and now walked back irresolutely toward the group of trees.

"I hope you are not enemies!" she said. "It is so causeless! So—so—incredible! I do not understand what it is! No one has explained it to me. Could you tell me?"

"No," said Hilgard, dejectedly; "I am not the one to tell you. You must have what faith you can in—both of us—until the truth comes out. But it is very hard to feel that your strongest bias must always be against me. If you would give me but the merest chance that any acquaintance might have, to put myself in some other light than the one I am doomed to in your eyes. You will always think of me as a determined partisan of the wrong side."

"If my brother brings you to the house, I will only think of you as our guest."

"Is that likely to happen, do you think?" he asked bitterly.

"No," she said, "it is not at all likely, but there is no other way." She stood with her shoulder against a slender pine and looked down at the scar in its side, touching it with remorseful fingers. "I don't know why it should be so, but I have known from the first that there could be no softening of this—of the bitterness between you and my brother by any effort of mine. It is a woman's place always to make peace, but it has been useless to try."

"But I declare to you that there is no bitterness on my part."

"Wherever it lies, it is there!" she said. "We cannot be friends—or even acquaintances."

"But you cannot make me your enemy! The bitterness shall not include us! What a strange fate it is that I should be on any side that is not your side!"

She was already moving away, but, at his words, she looked back without speaking. In the gathering dusk he could not read the expression of her eyes, but the mute action, trustful yet forbidding, racked his self-control.

## VII.

## THE BARRICADE.

MRS. DENNY had won from Conrath a reluctant promise that he would take her down the main shaft of the Shoshone, and through its subterranean workings. He had postponed the fulfillment of this promise until it had become a subject for rather keen bantering between these lively comrades. On the second day after the ball, Conrath surprised Mrs. Denny by asking her if she was ready to go down in the mine that afternoon.

He had called at her house in the morning, and the plan had been discussed between them as he sat on his horse, and she leaned on the pine-pole railing of the porch, wrapped in one of the fluffy white shawls in which she was fond of muffling her small, chilly form. Conrath was looking pale and somewhat demoralized after his stage-ride and its contingencies, the nature of which Mrs. Denny had gracefully indicated by pantomime to Hilgard on the night of the ball.

Mrs. Denny considered Conrath very handsome,—almost as handsome as Hilgard, and far more appreciative and generally available. She protested that she could not endure the wind on the porch, and chid him for permitting his pony to nibble the young growth on her favorite clump of fir-trees; but she did not go in, and Conrath lingered, as if he had something on his mind which he found it difficult to say.

"That beastly coach makes a perfect imbecile of a man," he began, with more vigor of expression than the uncertain look in his eyes bore out; "I felt, when I got in on Wednesday night, as if I had been kicked from Fairplay over the pass."

"Oh, I saw you," she replied, with a teasing smile. "It was plain enough that something had mixed you up pretty well! I told your sister you were a perfect wreck,—couldn't stand on your feet; wasn't that true?"

"Did you tell her that?"

"Of course I did. What was she to think of your leaving her at loose ends that way for the night? Who was to take her up to the mine? You're a nice brother, I must say!

She was a great deal more anxious about you than you deserved. She wanted to go to you, but I kept her away,—more for her sake than yours!"

Conrath flushed and laughed, with an awkward pretense of being amused at these accusations.

"I don't know who is to answer for all the fibs I had to tell her," Mrs. Denny continued; "you can't, because your time for repentance is fully occupied,—or ought to be!"

Conrath, shifting uneasily in his saddle, regarded Mrs. Denny's audacity with sulky admiration. It gave a certain piquancy to the commonplace nature of his weaknesses to be rallied upon them by a pretty woman.

"Are you sure Cecil did not know how it was the other night?" he asked.

"Do you suppose I would tell her?"

"No, but plenty of other people might. She has been very quiet and—well, different since the ball."

"You are very fond of your sister, aren't you, Con?"

"Of course I am. Why should I have brought her out here if I wasn't fond of her?"

"To be sure; that is proof enough." Mrs. Denny laughed her little mocking laugh. "She must be very fond of you, or she wouldn't have come. How does she amuse herself up at the Shoshone?"

"Well, she is alone a good deal, but she is used to that. She walks and reads and looks at the mountains. She could ride if I ever had time to go with her."

"Con, when your sister has been out here a year she won't need any information I or any one else could give her about you. She will know you thoroughly; she will think you all out. I wonder if she will have as much faith in you then as she has now?"

Conrath looked at Mrs. Denny uneasily.

"Are you preaching?" he asked. "Or what is it you are trying to get at?"

"Does it sound to you like preaching? If you can find a sermon in it, you are welcome. Much good may it do you!"

"Cecil is not as clever as you think," Conrath said, as if still considering Mrs. Denny's words. "She isn't cool and sharp, like you, and she isn't one of the exacting kind."

"Isn't she!" Mrs. Denny exclaimed. "Not in the way of attentions, perhaps; but if she should come to judge you once as she judges herself —"

Conrath's horse began to be restive.

"Are you trying to make me afraid of my little sister?" he interrupted.

"You might make her your conscience," Mrs. Denny replied. "It isn't a bad thing

for one to be a little bit afraid of one's conscience."

"You seem to have my failings on your mind—you might be my conscience yourself," Conrath suggested,—“taking it for granted, of course, that I have none of my own."

"No, thank you. You will need to keep your conscience nearer home. Besides, I might be too lenient."

Mrs. Denny laughed and ran into the house.

The party set out for the shaft-house after the three-o'clock whistle for the change of shifts had blown. The ladies were wrapped in india-rubber cloaks, and Mrs. Denny wore a soft felt hat of Conrath's on the back of her head, framing her face and concealing her hair. A miner's coat was spread in the bucket to protect the visitors' skirts from its muddy sides.

"If we keep on shipping ore at this rate," Conrath said, jubilantly, "we will soon have a cage that will take you down as smoothly as a hotel elevator."

Cecil was conscious that the exultant tone jarred upon her, and she took herself silently to task for this lack of sisterly sympathy.

Mrs. Denny went down first with the superintendent, who returned for Cecil; when they were all at the station of the lowest level, they lit their candles and followed one of the diverging drifts,—a low, damp passage which bored a black hole through the overhanging rock before them.

The sides of the gallery leaned slightly together, forming an obtuse angle with the roof; it was lined with rows of timbers placed opposite each other at regular intervals, and supporting the heavy cross timbers that upheld the roof. The spaces between the upright columns were crossed horizontally by smaller timbers called "lagging."

The brief gleam of their candles revealed the progress of the explorers step by step, in the face of the impalpable darkness which dropped like a curtain before them.

The candles burned with a still flame in the heavy, draughtless air. At long intervals a distant rumbling increased with a dull crescendo, and a light fastened in the rear of a loaded car shone up into the face of the miner who propelled it. They stood back, pressed close to the wall of the drift, while the car passed them on the tram-way.

The drift ended in a lofty chamber cut out of the rock, the floor rising at one end toward a black opening which led into another narrow gallery beyond.

"Here we are in the very heart of the vein," Conrath explained. "This is an empty 'stope,' that has furnished some of the best

ore. It is all cleaned out, you see; the men are working farther on."

"Oh, I should like to see them!" Mrs. Denny exclaimed. "Which way is it? Up that horrible place? Cecil, aren't you coming?"

Cecil had seated herself on a heap of loose planking in the empty ore-chamber.

"I'll wait for you here, if you don't mind; I am so very tired. Have you another candle, George?"

"Yours will last; we shall not be long gone."

Conrath and Mrs. Denny scrambled, talking and laughing, up the slope; their voices grew thinner and fainter, and vanished with their feeble lights in the black hole.

Cecil closed her eyes; they ached with the small, sharp spark of her candle set in that stupendous darkness.

What a mysterious, vast, whispering dome was this! There were sounds which might have been miles away through the deadening rock. There were far-off, indistinct echoes of life, and subanimate mutterings, the slow respirations of the rocks, drinking air and oozing moisture through their sluggish pores, swelling and pushing against their straitening bonds of timber. Here were the buried Titans, stirring and sighing in their lethargic sleep.

Cecil was intensely absorbed listening to this strange, low, diapason of the under world. Its voice was pitched for the ear of solitude and silence. Its sky was perpetual night, moonless and starless, with only the wandering, will-o'-the-wisp candle rays, shining and fading in its columnated avenues, where ranks of dead and barkless tree-trunks repressed the heavy, subterranean awakening of the rocks.

Left to their work, the inevitable forces around her would crush together the sides of the dark galleries, and crumble the rough-hewn dome above her head. Cecil did not know the meaning or the power of this inarticulate underground life, but it affected her imagination all the more for her lack of comprehension. Gradually her spirits sank under an oppressive sense of fatigue; she grew drowsy, and her pulse beat low in the lifeless air. Drooping against the damp wall of rock, in a semi-oblivious moment, her candle dropped from her lax fingers, and was instantly extinguished.

It seemed to the helpless girl that she had never known darkness before. She was plunged into a new element, in which she could not breathe, or speak, or move. It was chaos before the making of the firmament. She called aloud,—a faint, futile cry, which frightened her almost more than the silence. She had lost the direction in which her brother had disappeared, and when she saw an advancing

light she thought it must be he coming in answer to her weak call.

It was not her brother; it was a taller man, a miner, with a candle in a miner's pronged candlestick fastened in the front of his hat. His face was in deep shadow, but the faint, yellow, candle rays projected their gleam dimly along the drift by which he was approaching. Cecil watched him earnestly, but did not recognize him until he stood close beside her. He took off his hat carefully, not to extinguish the candle which showed them to each other. Cecil, crouching, pale, and mute against the damp rock, looked up into Hilgard's face, almost as pale as her own.

No greeting passed between them. They stared wonderingly into each other's eyes, each questioning the other's wraith-like identity.

"I heard you call," Hilgard said. "Is it possible that you are alone in this place?"

"No," she replied, feebly rousing herself. "My brother is here, with Mrs. Denny; they are not far away."

"Your brother is here—not far away?" he repeated. A cold despair came over him. There was nothing now, but to tell her the truth; in her unconsciousness of its significance she would decide between them, and he would abide the issue. He leaned against the wall of the drift, wiping away the drops of moisture from his temples; the short damp locks that clung to his forehead were massed like the hair on an antique medallion.

"You did not know me?" he asked.

"No; I could not see your face."

"I am not showing my face here. I am a spy in the enemy's camp. Your brother will hear the result of my discoveries, in a few days, from my lawyers."

It was roughly said, but the facts were rough facts; and he could not justify or explain himself to her, except at the expense of her brother.

"Must I tell him that you are here," she asked.

"I suppose so, if you are a loyal sister."

"But I would never have known it, if you had not come when I called. My candle fell and went out. I was alone in this awful darkness."

"But some one else would have come if I hadn't. You need not be grateful for that. Your brother would have found you here."

"But I could not have endured it a moment longer!"

"Oh yes, you would have endured it. I need not have come."

"Why did you come, then?"

"I don't know," he said. "I was a fool to come. Why does a man come, when he

hears a woman's voice, that he knows,—in trouble?"

He was groping about on the floor of the drift in search of her candle; and now, kneeling beside her, he lit it by his own and held it toward her. Their sad, illumined eyes met.

"How your hand trembles; were you so frightened?" he asked.

"Yes; does it seem very silly to you? My strength seemed all going away."

It was madness for him to stay, but he could not leave her, pale, and dazed, and helpless as she was.

"Let me fix you a better seat." He moved the rough boards on which she was sitting to make a support for her back.

"Oh, please go, and get out of the mine!" she entreated,—with voice and eyes, more than with words.

"But I cannot get out, until the next change of shifts. I have taken the place of one of the miners on this shift; besides, I have not finished what I came for."

"Why do you call yourself a spy? are you doing anything you are ashamed of?" she asked, with child-like directness.

"I am a little ashamed of the way I am doing it," he replied with equal directness, "but not of the thing I am doing."

"And will it injure my brother—what you are doing?"

"Not unless the truth will injure him; I am trying to find out the truth."

"But why should you come in this way to find it out? Surely my brother wants to know it too, if it is about this quarrel."

It was a home question; he could only answer:

"Your brother is very sure that he knows the truth already. I want to be sure too. I am not asking you *not* to tell him I am here. I have taken the risks."

"What are the risks?" she asked quickly.

"They are of no consequence compared with the thing to be done—I must not stay."

"Ah!" she cried, with an accent of terror.

"They are here!"

A light showed at the dark opening above the incline, and the thin stream of Mrs. Denny's chatter trickled faintly on the silence.

Cecil put out both candles with a flap of her long cloak.

"Oh, *will* you go!"

Hilgard heard her whisper, and felt her hands groping for him in the darkness, and pushing him from her. He took the timid hands in his and pressed them to his lips, and then stumbled dizzily away through the blackness.

A proposition from her companions to

prolong their wanderings until they had reached the barricade was opposed by Cecil with all the strength her adventure had left her; but when it appeared that their way lay along the same drift in a direction opposite that by which Hilgard had made his retreat, she offered no further objection. Her silence was sufficiently explainable by the fright she had had in the darkness.

The drift led to another smaller ore-chamber, where miners were at work, picking down the heavy gray sand, and shovelling it into the tram-cars. Conrath explained that this "stope" was in the new strike, claimed by the Led-Horse, and that the barricade guarded the drift just beyond.

"I suppose it doesn't make so much difference who the ore belongs to," Mrs. Denny commented lightly; "it's a question of who gets it first! *Passez, passez!* You needn't stop to expostulate. I am not a mining expert."

Conrath looked excessively annoyed, but refrained from defining his position to this cheerful non-professional observer. As they entered the low passage, they found themselves face to face with a wall of solid up-right timbering which closed its farther end, and in the midst of a silent group of men, seated along the side-walls of the drift on blankets and empty powder-kegs.

The barricade was pierced at about the height of a man's shoulders with small round loop-holes. Two miners' candlesticks were stuck in the timbers, high above the heads of the guard, who lounged, with their rifles across their knees, the steel barrels glistening in the light.

Cecil's fascinated gaze rested on this significant group. The figures were so immovable, and indifferent of face and attitude, so commonplace in type, that she but slowly grasped the meaning of their presence there. These then were the risks that were of no consequence!

Turning a white face of horror upon her brother, she demanded, "Is this what you have brought us to see?"

"I thought you knew what a barricade was!"

"I never knew! I knew—I thought it was that"—pointing to the wall of timber—"but not this!" She looked toward the silent group of men, each holding his rifle with a careless grasp.

"You wouldn't make a good miner's wife, Cecil," said Mrs. Denny; and a slow smile went round among the men.

"Hark," said Conrath. They were still facing the barricade, and the dull thud of picks far off in the wall of rock sounded just

in front of them. "Do you hear them at work. Now turn the other way." The sound came again, precisely in front. "They are a long way off yet. Can you make out how they are going to strike us, boys?" Conrath asked of the guard.

"You can't tell for sure, the rock is so deceivin'; but they seem to be comin' straight for the end of the drift."

"Who are they—who are coming?" Cecil demanded.

"The Led-Horses, my dear. They may blast through any day or night, but they'll find we've blocked their little game."

"What is their game?" Mrs. Denny inquired.

"They claim our new strike, and from the sound they seem to be coming for it as fast as they can!"

Cecil locked her arms in the folds of her long, shrouding cloak, and a nervous shudder made her tremble from head to foot.

"Poor little girl!" said Conrath, putting his arm around her shoulders; "I ought to have taken you straight home after the fright you got in the drift."

"Why, do you know," said Mrs. Denny, looking a little pale herself, "I think this is awfully interesting. I'd no idea that beautiful young Hilgard was such a brigand. Just fancy, only two nights ago you were dancing with him, Cecil!"

"What?" said Conrath, turning his sister roughly toward him with the hand that rested on her shoulder. She moved away, and stood before him looking at him, her straightened brows accenting the distress in her up-raised eyes.

"Why should I not dance with him? In this place you all suspect each other, and accuse each other of everything. He accuses you. Shall Mrs. Denny on that account refuse to dance with you?"

She spoke in a very low voice, but Conrath replied quite audibly, "Don't be a fool, Cecil?"

"Oh," she said, letting her arms fall before her, desperately—"it is *all* the wildest, wildest folly that any one ever heard of! Men fighting about money—that isn't even their own!"

"We're not fighting," Conrath replied. "Half the mines in the camp are showing their teeth at each other;—it's the way to prevent fighting. If they keep on their own ground there won't be any trouble; but," turning to Mrs. Denny with a darkening look, "if I catch that 'beauteous' friend of yours on my ground, he'll be apt to get his beauty spoiled."

On their way back along the drift, they

were warned by a spark of light and a distant rumbling that a car was approaching along the tram-road. They stopped, and, lowering their candles, stood close against the sloping wall while the car passed. It was at the entrance to another dark gallery, and as the car rolled on, the warm wind of its passage making their candles flare, it left them face to face with a miner, who had also been overtaken at the junction of the drifts. He was tall, and his face was in deep shadow from the candle fastened in the crown of his hat. He stepped back into the side-drift, pulling his hat-brim down.

"Who was that?" Mrs. Denny asked.

"I didn't notice him," Conrath replied. "One of the Cornish-men on the last shift. I don't know all their faces."

"He doesn't walk like a Cornish-man," said Mrs. Denny, looking after him, "and his hand was the hand of a gentleman." They moved on a few paces in silence. Cecil flagged a little behind the others and then dropped suddenly to the floor of the drift in a dead faint.

It was the air, they said,—and the nervous shock she had suffered while alone in the ore-chamber.

She let them explain it as they would, only begging to be left to recover herself quietly in her own room.

When the little stir of Mrs. Denny's departure had subsided, and the house was once more silent, Cecil rose, still pale and shuddering with slight, successive chills, and sought the snug warmth of the kitchen. It was early twilight, but a lamp had been lit on the shelf above the ironing-table, where the maid was at work, rubbing and stretching her starched cuffs, and clapping the iron down at intervals on its stand. From time to time she bestowed a glance of sympathy on her young mistress's dejected figure, crouching by the stove, her hands extended toward the steam from the kettle.

"Molly, if anything should happen at the mine, would the engine stop right away?" Cecil asked, after a long silence.

"Why, yes, Miss, if anything broke."

"No, I mean if any one were hurt."

"Well, if 'twas one of the men, maybe they wouldn't stop," said Molly, gravely lifting a fresh iron from the stove, and inverting it close to her glowing cheek. "The pumpin'-engine don't never stop, unless somethin' breaks, or the mine shuts down for good an' all."

"But if it were—if anything should happen to my brother?"

"They'd stop, if the superintendent was hurt—of course they would, Miss."

"The engine would stop?" Miss Cecil repeated, lifting her head from the supporting hand on which it had rested.

"Yes, Miss, it would."

They were both silent, while Cecil seemed to listen. "Mr. Conrath is not underground, is he, Miss?"

"No, he went down to the camp with Mrs. Denny;—will you open the door a moment, Molly?"

Molly opened the door and stood against it, folding her bare arms in her apron—a warm, bright figure, with the steel, cold sky of twilight behind her. The heavy heart-beats of the engine came distinctly from the shaft-house. Cecil went to the door and stood beside Molly, looking out at the dull sky, and the new, unpainted buildings, crudely set in the low-toned landscape of evening.

"Do you hear the other engine?" Cecil asked, after a moment's doubtful listening.

"The one over yon, Miss? I hear it plain—wait now! It comes faint-like, between. Was you thinkin' anythin' would be happenin'?"

"I'm always thinking something will happen," said Cecil, a deep sigh following her long-suspended breath.

"Yes, there's a mort o' trouble with them mines! Most every day some of 'em gets hurt. They gets a bucket dropped on their heads, or a rope breaks, or a blast goes off; or they sets a kag o' that Giant on the stove to warm it, and it goes off on 'em and tears everything to pieces."

"What is 'Giant,' Molly?"

"It's a kind of powder, Miss—awful innocent lookin' stuff, like cold grease—but it do send a lot o' them poor fellows out o' the world! They gets careless, that's what the companies says."

"Do you know anybody in the mines, Molly?"

"Why, yes, Miss. My brother's on the Led-Horse, and I know another o' the boys across the gulch."

"Molly! how strange that is!"

"Is it, Miss? Sure, I don't know why! Tom's been over there since ever Mr. West come. He worked under him in Deadwood. He likes Mr. West first-rate, an' he likes Mr. Hilgard."

"Who put Mr. West in, do you know?"

"Mr. Hilgard, Miss. They was a loafin', drinkin' set over there when he come out from the East to take holt, and he couldn't make nothin' of 'em; an' so he clears out the whole lot of 'em, and Gashwiler at the head of 'em and the worst one of all, to put in Mr. West an' a new gang o' men."

"Gashwiler—do you mean *our* captain?"

"I do, Miss!"

"Oh, Molly! I never knew that! Shut the door—I'm so cold! I never knew it!" she repeated, gazing at Molly desolately.

"It might be you didn't, Miss—but it's the truth. Mr. Conrath maybe 'd pack me out of the house for sayin' it, but it's my belief that Gashwiler's making the whole trouble between 'em. He knows the Led-Horse, every inch of it, Miss, and where their ore is, just 's I could come in here and lay my hand on the flour-barrel in the dark."

Again in silence they listened to the beat of the engines.

"When do the men on the three o'clock shift come up, Mollie?"

"At eleven o'clock, Miss."

"Why, how long they stay down there!"

"Eight hours it is, above ground, and eight below. I bet it seems long to them that's below!"

"Oh!" said Cecil, lifting her hands, and pressing them on the top of her head, "I wish they would *all* resign!"

(To be continued.)

## INDIVIDUALITY.

SAIL on, sail on, fair cousin Cloud:  
Oh, loiter hither from the sea.

Still-eyed and shadow-brow'd,  
Steal off from yon far-drifting crowd,  
And come and brood upon the marsh with me.

Yon laboring low horizon-smoke,  
Yon stringent sail, toil not for thee  
Nor me: did heaven's stroke  
The whole deep with drown'd commerce choke,  
No pitiless tease of risk or bottomry

Would to thy rainy office close,  
Thy will, or lock mine eyes from tears.

\* \* \* \* \*

—Lo, Cloud, thy downward countenance stares  
Blank on the blank-faced marsh, and thou  
Mindest of dark affairs;  
Thy substance seems a warp of cares;  
Like late wounds run the wrinkles on thy brow.

Well mayst thou pause and gloom and stare,  
A visible conscience: I arraign  
Thee, criminal Cloud, of rare  
Contempts on Mercy, Right, and Prayer,—  
Of murders, arsons, thefts,—of nameless stain.

(Yet, though life's logic grow as gray  
As thou, my soul's not in eclipse.)

Cold Cloud, but yesterday  
Thy lightning slew a child at play,  
And then a priest with prayers upon his lips

For his enemies, and then a bright  
Lady that did but ope the door  
Upon the stormy night  
To let a beggar in,—strange spite!—  
And then thy sulky rain refused to pour,

Till thy quick torch a barn had burned,  
Where twelve months' store of victual lay,  
A widow's sons had earned;  
Which done, thy floods with winds returned,—  
The river raped their little herd away.

What myriad righteous errands high  
 Thy flames might run on! In that hour  
 Thou slewest the child, oh why  
 Not rather slay Calamity,  
 Breeder of Pain and Doubt, infernal Power?

Or why not plunge thy blades about  
 Some maggot politician throng,  
 Swarming to parcel out  
 The body of the land, and rout  
 The maw-conventicle, and ungorge Wrong?

*What the cloud doeth,  
 The Lord knoweth,  
 The cloud knoweth not.  
 What the artist doeth,  
 The Lord knoweth;  
 Knoweth the artist not?*

Well answered! O dear artists, ye—  
 Whether in forms of curve or hue  
 Or tone your gospels be—  
 Say wrong *This work is not of me,*  
*But God:* it is not true, it is not true.

Awful is Art because 'tis free.  
 The artist trembles o'er his plan,  
 Where men his self must see.  
 Who made a song or picture, he  
 Did it, and not another, God nor man.

\* \* \* \* \*  
 Oh, not as clouds dim laws have plann'd  
 To strike down Good and fight for Ill,—  
 Oh, not as harps that stand  
 In the wind and sound the wind's command;  
 Each artist—gift of terror!—owns his will.

For thee, Cloud, if thou spend thine all  
 Upon the South's o'er-brimming sea  
 That needs thee not; or crawl  
 To the dry provinces, and fall  
 Till every convert clod shall give to thee

Green worship; if thou grow or fade,  
 Bring on delight or misery,  
 Fly east or west, be made  
 Snow, hail, rain, wind, grass, rose, light, shade:  
 What matters it to thee? There is no thee.

Pass, kinsman Cloud, now fair and mild:  
 Discharge the will that's not thine own.  
 I work in freedom wild,  
 But work, as plays a little child,  
 Sure of the Father, Self, and Love, alone.

*Sidney Lanier.*

## THE COREAN ORIGIN OF JAPANESE ART.

THE long-closed peninsula of Corea, after repeated efforts of France, Russia, England, Germany, and Italy to open it to foreign commerce, has yielded at last to American diplomacy, and has become a treaty-partner with the United States. After three distinct rebuffs, one as long ago as 1866, Commodore R. W. Shufeldt has won a diplomatic triumph that fitly crowns a long and brilliant professional career in the Navy of the United States. Though it is not probable that this treaty will be ratified in its present form, especially if it recognizes the suzerainty of China over Corea, yet friendship between the two countries is now assured. Commerce will soon bring "the hermit into the marketplace," and Corean bric-à-brac, which, although coarser than the Japanese, is fully as characteristic, will be less of a rarity in our shops. If China is the Egypt, and Japan the Greece of eastern Asia, then Corea is the Cyprus, supplying the middle term of development between the two phases of art. Corea is not merely the path by which Chinese art entered the Mikado's empire, but the land in which that art was modified and developed. Before considering this topic, let us glance for a moment at the recent history of this strange land.

The Japanese, by making a treaty in 1876, in which they recognized Cho-sen, as they properly call Corea, as an independent and sovereign nation, thereby abandoned a claim upon her as a vassal nation which they had held for over fifteen hundred years. Nor has the Mikado's government ever recognized China's claim of suzerainty over Corea,—a fact pregnant with mighty issues in the future of history on the Asian Pacific coast. Since 1878 the Japanese have had a legation in Seoul. The rival political parties in Corea, losing sight of old issues—chiefly dynastic and local questions—have re-arranged themselves as Progressionists ("Civilization party") and Conservatives ("Corea for the Coreans"); a second ground of division being in the pro-Chinese and pro-Japanese sympathies, according to the one or the other of which China or Japan serves as a model of national policy.

In 1864, the dynasty of Ni, founded in 1392, came to an end by the failure of direct heirs. The three widows of former sovereigns agreed upon the choice of a boy then but twelve years old, whose father Ni Kung was supposed to be inert and neutral in politics;

but no sooner was his son declared sovereign, and himself Tai-wen-Kun (Lord of the Great Court),—the title of a noble whose son is made king,—than he seized the reins of power, and ruled the country with "heart of stone and bowels of iron," as the Coreans say. Under his rule, the nine French bishops and priests who had lived in the country in disguise were beheaded; and in the frightful persecutions which followed, many thousand (some say one hundred and fifty thousand) natives were tortured or put to death, while thousands more fled into the Russian possessions. The burning of the American vessels *General Sherman* and the *China*, both suspected of being on piratical expeditions to rob the tombs of Corean kings, also took place under his regency. In 1873 the young king attained his majority, and took upon himself the active duties of the throne, his queen Min—a woman of great ability—urging friendship with Japan, and checkmating the power of the Regent. As a result of the constant agitation of the Progressionists, the influence of Li Hung Chang, the able Chinese liberal, and a spirited memorial from Kwo-in-ken, a Chinese publicist, who urged Corea to make a treaty with the Americans—the natural friends of Asiatic States—the young king, backed by his ministers Bin Kenko, Bin Hogen, Ri Saiwo, and others, sent word to Commodore Shufeldt, then in Tien-tsin, that all was ready for a treaty. Accordingly, Commodore Shufeldt appeared in the U. S. S. *Swatara*, May 7, 1882, off In-chiun (Jap. Ninsen) the newly opened port in Imperatrice Gulf, twenty-five miles from the capital. On the 9th the treaty was signed, and shortly after similar treaties were concluded with China, Great Britain, France, and Germany.

The opening of a port so near the capital, and the signing of treaties with foreigners, stirred up the bigoted alien-haters and Confucianists to the highest pitch of rage. Inflammatory placards were posted on the palace gates, processions of men, dramatically robed in mourning and bearing remonstrances, paraded the streets of Seoul, and the erection of hundreds of monuments inscribed with ultra-patriotic sentiments went on daily. Unfortunately, no rain had fallen for some weeks after the treaties were signed, so that the wells dried up, and the rice-crop threatened total failure. While the garrison had no rice for rations, the Japanese in Seoul—

numbering forty persons—were well supplied. The leaders of the anti-foreign party, headed by the ex-regent, Tai-wen-Kun, stirred up the peasantry and turbulent soldiery to believe that the spirits were angry because foreigners

rise; must not even the Western foreigner do reverence?" The commercial spread of Japanese art during the last twenty years, and its consequent influence upon Western life, are familiar to the reader of contemporary

MEN OF SHINRA SUBMIT THEMSELVES TO QUEEN JINGU. (A. D. 202.)

had polluted the soil of the holy country (Corea). The consequences were seen in the murderous riot of July 23d, in which seven Japanese, the queen, the heir-apparent and his bride of two months, the superintendent of the rice-granaries, and three prominent ministers of the court, were killed by the rioters, who numbered four thousand. The subsequent events—the prompt and firm action of Japan, and the deposition of Tai-wen-Kun by China, are well known.

A new sunrise in decorative art has dawned upon us since "The House of the Morning" opened its doors to Commodore Perry in 1854. Those who crossed the threshold began at once to gather up the art treasures visible on every side; but the first systematic collection of art objects from Japan was made by Sir Rutherford Alcock, and was exhibited in Paris in 1862. Later on, in the exhibitions in London, Vienna, and Philadelphia, the Japanese erected a Gate Beautiful, through which delighted Westerners entered to fulfill a poet's prophecy, uttered a thousand years ago: "In our ancient island, Yamato [Japan], the sun

literature, for whose benefit a small library of books and essays on the subject have been written; but few know to what extent Japan was indebted for its art to its neighbor.

For Japanese art is not original. The full sunrise and mid-day of oriental art belongs, indeed, to the islands, but the fountains of its first light lay in the near peninsula, known for centuries to the Japanese as "The Treasure Land of the West." A thousand years before Perry sailed for the Tycoon's capital, the subjects of Haroun Al Raschid traded with the Coreans, bringing to Bagdad and Damascus pearls, gold, jeweled ornaments, saddles, porcelain, and drugs from Shinra (an ancient state in Corea); while in Nankin and the palaces of China the fame of the peninsular art was great. The Japanese themselves clearly distinguish the various elements in their art-products, according to their Chinese, Corean, or Buddhist origin, calling them respectively *Kara-we*, *Korai-we*, *Butsu-we*. The Persian influence, though distinctly traceable, is not named, or is classified with the India or Buddhist school.

For centuries after the introduction of

artists and models from the Corean peninsula to Japan, art was an exotic in Nara, the ancient capital. When, at last, it took root in Kioto, and began to flourish, the motives and models were Corean. Chinese art in Japan remains, to this day, distinct and apart. Corean art has been absorbed in the Japanese; yet, none the less does the credit belong to the Land of Morning Calm. The fountain and the rill have been lost in the river, yet the fountain was before the river.

"Long ere great Buddha strode  
Upon his calm, colossal, god-like way  
O'er the broad rolling rivers of Cathay,  
By the Korean road,

"And stepping stormy seas  
Hither, to mount the golden lotus throne  
Of Nara, there to rule and muse alone,  
Through lingering centuries."

Japan, while borrowing nearly everything that was worth borrowing from China, received it through a filter. Corea once willingly sifted her benefits on Arabs and Japanese alike; but when every mesh was frozen fast by the policy of almost polar seclusion, she went back to her old pupil to learn anew.

Yet it is not the degenerate Corea of to-day that supplied the ground-forms of the art now so admired by us, but the Shinra and Korai of the early and middle ages. In these, art came to the flower, only to be plucked and worn by the Japanese. The cynical critics of the Japanese legation in Seoul tell us that "art is in a very backward state in Corea,"—"that the finest pictures seen on the screens of the best rooms in Seoul might be purchased in Tokio for a *tempo* [penny] or so." As yet, however, these modern Anaks, despising the grasshopper Coreans, have not entered the king's palace, or the houses of the nobles. A study of the past achievement of Corean fingers in decorative art will show that, at the outset, the peninsula was the teacher, and the islands the pupil. The decay of Corean art was largely due to the fact that the Japanese drained the rival country of her best artists and workmen. The emigrations of Coreans to Japan, so often noticed in the annals of the latter country, resemble the scattering of the Huguenots in Europe. Of this, let us proceed to give historic proofs.

In the first place, the Japanese and Coreans are but as Americans and Englishmen, "cousins" in ethnology, language, and customs. They are branches of the one Fuyu race, whose ancestral seats were in Manchuria. Of the repeated swarming of new races away from the old hive in the Amoor

and Sungari valleys, this immigration alone turned to the eastward, all the others moving to the west. Peering through the gauze curtain of ancient Japanese legend, we see the first invaders from the peninsula sailing across the sea of Japan and landing on the islands which they named Nippon, or Rising Sun. Especially can we detect that Susanoo, a sort of celestial scamp who plays pranks or benefits mankind as the mood seizes him, was a genuine Corean, who planted the new country with seeds from the peninsula. The first visitors to the new settlers from the old country brought jewel-work and gems, and, about 200 A. D., the Amazonian widow of the Mikado, Jingu Kogo, invaded Shinra, put the land under tribute, and returned to Japan with eighty ships loaded with works of art and skill (see the illustration on page 225). These comprised pictures, brocades, precious stones, books, and various articles new to the warriors of Yamato. A century or two later followed teachers, artists, costumers, architects; and, in 552 A. D., Buddhist priests with images and sacred rolls, temple builders and decorators, bringing in a vast train of civilizing influences, arrived at the court of the Mikado and succeeded in intrenching themselves (see the illustration on page 227). What the Roman Catholic church is to Europe, Buddhism is to Asia. Shintoism is Puritan as to art,—austere and unsensuous; so also is Confucianism.

Not until the ninth century was there any native art in Japan; it was all Corean or Chinese. There was an Imperial School of Painting (*We-dokoro*) having four chief painters and sixty sketchers or draughtsmen, whose main business it was to decorate the palace and public buildings; but these were all Coreans. The office was subsequently incorporated with the Bureau of Architecture, the chief, or "painter-laureate," as he may be called, being, however, held in special honor. It was not until near the close of the ninth century that the first native artist of any prominence arose, in the person of Kanaoka, who painted natural objects, animals, and Chinese sages. Not until the eleventh century did a distinctively native school of art, treating subjects chosen at home, arise. This *nishiki-ye*, or "brocade-style," in which the details of costume were brilliantly depicted, was succeeded, two or three centuries later, by the Tosa style, in which broad masses of gold and many bright colors are used to portray court scenes and palace life. In the fifteenth century, along with the passion for Corean white porcelain, came the rage for those dark glazed bowls and cups which now bring absurdly large prices. The patronage

COREAN ENVOY PRESENTING AN IMAGE OF BUDDHA TO THE MIKADO. (A. D. 255.)

of the mighty Taiko (*Hideyoshi*) and the demand of the Kioto tea-clubs brought over the very best of the Corean artists in clay. It is, perhaps, no exaggeration to claim that one of the motives which helped to swell the war-cry of "On to Corea!" in 1592, was the desire of Taiko's generals to seize and bring over the entire ceramic art and industry of Corea bodily. It is a matter of record that when the war was over, in 1597, the daimios of Satsuma, Bizen, Higo, and Choshu, who had secured colonies of Corean potters and decorators, transported them to their respective provinces in Japan. From these immigrants grew up the schools of decorative and ceramic art, known under the name of Satsuma, Hizen, Imari, Arita, Bizen, Higo, and Choshu. Immense treasures of Corean art were also sent from the peninsula while the war was in progress, and previous to it the Kioto schools of pottery and decoration were of Corean origin. Other excellent specimens of Corean art in Japan in painting, ceramics, bronze, and architecture, may be found in the temples and museums at Nara, Kamakura, and other places, and the tombs of Nikko and Tokio. Among the objects brought by the tribute-bearers from the vassal country to the court of the Tycoon in Yedo during the seventeenth century were bronzes cast in the characteristic wave-pattern. Of the many colonies of Corean artificers located

in Japan, from the fifth to the fifteenth centuries, nearly all have effectually mingled their blood and speech with the Japanese. Those who settled in Satsuma have not entirely lost their original lineage and tongue. Except in painting and lacquer, most of the really artistic products of Japan date from the fifteenth century, or even later,—in other words, after Japan had exhausted Corea. It is rare indeed to see a famous seat of high art industry not founded by Coreans.

In an exposition of the various forms of the decorative art of Nippon, even the tyro soon discovers a few patterns constantly repeated. In reality, these are mostly, if not entirely, borrowed or improved Corean. Let us note a few of them.

The "wave-pattern," seen on coins, bronzes, brocades, carvings, and color-decoration, is perhaps the most characteristic. It interprets the Corean phrase which is nearly equal in poetic beauty to Sophocles' ἀνάρηθμον γέλασμα, "unnumbered laughings,—ten thousand flashings of blue waves." It has been largely copied, with variations, by Western designers, and may be seen on the Corean water-pot in Jacquemart's collection. The Japanese have added the stormy petrel and the tortoises of longevity. The fallen autumnal leaf floating on the running stream, or the half-submerged flower borne on the current from home to the sea, is also a Corean sentiment expressed in art, which

the Japanese have borrowed and abundantly expanded with excellent effect. The graceful curve and dash of sea-waves imitated on the handles of tea-pots, and in such positions as serve to display the full form untrammelled, is also a Corean, not a Japanese, invention. So also is the tall and graceful long-lipped tea-pot. The orthodox Japanese utensil is chubby and round. Many of the exquisite

or, perhaps, as it may be called, the conventionalized chrysanthemum design, is also distinctively Corean. The successive layers of the narrow-petaled autumn flower which is the imperial favorite in Japan, may have suggested the decorative form actually used, though we think the idea was caught from those deft arrangements in bamboo threads, which in the two countries are made to simu-

COREAN TRIBUTE-BEARER BEFORE THE TYCOON, YEDO. (SEVENTEENTH CENTURY.)

shapes of grace and beauty usually ascribed to the cunning eye and hand of potters in the Mikado's domain had many an ancestor in the peninsula, whence came the first potter's wheel and much of that ancient blue ware which is still called "Corean faience."

The "arabesque" lines of decoration that break up the total surface of decoration by flat fillets, or curved flutings, are purely Corean. These may be seen in the typical water-pot of Jacquemart. Under handle and spout, and along the sides run these vertical strips of decoration. Fruit, flowers, but especially the peony, are tastefully wrought into so-called arabesque forms, the Corean term for which is *chui-piong*. It is seen in richest luxuriance upon fans, curtains, musical instruments, and as embroidery upon garments. The peony blossoms liberally in all works of art from the peninsula, and with wondrous variation and adaptation is effectively used in center-pieces, as rosettes, and wherever richness of mass is desired. The plaited split-bamboo pattern,

late floral designs. A specimen may be seen on the obverse of a drum, under the flags in the illustration on page 229.

We incline even to the belief that the landscape school of the gold-lacquer artists, porcelain and silk painters of Japan, were but docile pupils of Corean masters. The student of the gilded pictures of wave, sky, cloud, field, and house, seen on box and tray, *inro* and scroll, cannot but admire the rich effect, however he may criticise from an alien, or even from a scientific, point of view. Yet the lacquering and painting of landscapes is comparatively modern in Japan. Pieces may indeed be found containing flowers and religious subjects which date back even to the tenth century; but the "mountain, sky, and water" pictures, and what we call "landscape" paintings do not, on porcelain, antedate the end of the sixteenth, or lacquer the fifteenth, and on silk, wood, or paper, the twelfth century, while in Corean, the landscape in decoration is far older. Indeed, the whole drift of Japan-

MUSICAL INSTRUMENTS AND FLAGS USED IN THE ROYAL PROCESSION.

ese art traditions carries us back to Corea, or to Corean artists in Japan.

In this paper, we do not need to dwell upon the subjects chosen in common by the painters of Chinese Asia,—the four divinely constituted beasts: dragon, phoenix, tortoise, and *kirin*; though in the treatment of these favorites one soon learns to distinguish the nationality and the mannerism or genius of the masters. These four ideal creatures, and the sacred jewel-crystal or pearl, the swastika (卐), the “Greek key,” and many other forms and tricks of art, are not specially characteristic of any nation borrowing from China.

A supreme love of nature and delicate sensitiveness to her varying moods were the possession of the Corean long before these emotions were familiar to Japanese artists. In the Land of Morning Calm (as the people of the little kingdom love to call their country), the artists had learned to transmute their thoughts into form and color centuries before those who lived nearer the sun-rising. Much of the supposed “love of nature” and “faith-

fulness to nature” exhibited by the Japanese artist is, in actual fact and plain prose, nothing more than technical skill learned by rote from traditional models. Translate the rhapsody of Mr. Jarves to a native artist in Tokio, and the result would be open-eyed wonder, and a volley of honestly spoken *e, e, e*, (no! no! no!) Yet we do not forget that our author professes only a glimpse!

Art in Corea of to-day is indeed at a low ebb. By shutting out all the world, the hermit nation has lost her cunning. The prized white ware sometimes seen in collections dates from before the Japanese invasion of 1592. The so-called cheap “celadon” ware figuring as “Corean” in catalogues of sale, simply illustrates the elastic ideas of geography possessed by auctioneers. Judging, however, from the number of art terms in the Corean language, and arguing from the recent history of Japan, we think it not impossible that the last of the hermit nations may hold for the art-world one of the surprises of the future.

*William Elliot Griffis.*

COREAN WAVE PATTERN.

## THE TAXIDERMAL ART.

READY FOR WORK.

THE recent sale of the Audubon collection of birds' skins awakened little interest, even among ornithologists: nor is this surprising, for Audubon was famous for his sketches and descriptions, rather than for his collections. When a bird was bagged, it was his habit to pin it to a neighboring tree and make a colored drawing. An accurate eye and skillful hand enabled him to imitate those delicate tints which the experienced taxidermist alone can hope to preserve in the specimen; and the measurements he has recorded, taken from birds while the bodies were yet warm, serve sportsmen as criteria even to-day. But, unfortunately for the student of natural history, the author of "The Birds of North America" did not apply himself to the taxidermist's art, and the collection of skins he has left behind him has little more than a historical value.

Waterton, his contemporary, whose name is as famous in England as that of Audubon in America, by reason of his attention to the art of preserving specimens, left far more to posterity. The coloring on Audubon's representations, once so accurate, has dulled and faded with time; new and better methods

have been found for imitating plumage, and cheaper though no less reliable plates are at hand. But the collection of birds stuffed by Waterton, now in the museum at York, is deserving of praise, and his directions for imitating the posture of birds, as well as his receipts for preserving their skins, are of great practical value. Waterton had exceptional facilities for obtaining perfect specimens of birds. He possessed a large estate at Wilton, in Yorkshire, about which he built a high, stone wall, ten miles long. Within its boundaries were woods and lakes, fells and valleys, and there the songster and the game-bird built their nests undisturbed and grew tame. Thus Waterton was enabled to obtain unblemished specimens. The value of these, when the subjects are small birds, can be appreciated only by the naturalist and the sportsman. The feathers of a bird fall gracefully, the one over the other, and, when pierced by shot, they are, to a certain extent, disarranged, and their beautiful harmony is interrupted. To correct such defects, the taxidermist draws down the feathers immediately over the wound, and pulls up those beneath; but this, though con-

cealing the gap, distorts the plumage and contracts the skin.

Waterton's directions for stuffing animals, which have, from time to time, furnished cause for laughter, possess other merits save that of being unique. He maintained that an animal should be stuffed in three sections: (1.) The head and fore legs; (2.) the body from the shoulders to the flare of the flanks; (3.) the flanks and the hind legs. Such treatment is calculated to strike the novice as ridiculous, but a careful examination will demonstrate that this plan, though it possesses defects, has much to commend it. It was, no doubt, the difficulty of stuffing a skin in its entirety, of imitating the muscles and tendons, the protrusions and depressions, the play of the joints, and the expression of the various parts, that led Waterton to divide it.

It is not enough that the dimensions of the subject be carefully recorded, the skin removed by skillful use of the scalpel, and the wounds stopped while yet warm. All these are essential to an accurate artificial reproduction, but they are, by no means, an assurance of it. It is upon the subsequent treatment of the skin that the success of the final mounting of the specimen depends. And here it may be laid down as a fact that no taxidermist can be trusted to stuff a bird or animal with the characteristics of which he is unfamiliar. Examples of monstrosities due to such ignorance were recently noticed in a taxidermist's window. One of these had the plumage of an eagle, but its body was almost parallel to the ground, and its drooping wings expressed ignoble indolence. These are attributes of the vulture, not of the eagle, whose very name symbolizes dignity, cour-

age, and grace. Another had the plumage of a magpie, but the man who stuffed and mounted it was ignorant of the craftiness and sprightliness of the magpie, or he would not have allowed it to assume such a heavy, hang-dog appearance. There was also the skin of a fox, but the taxidermist had not been happy in catching its cunning expression, and, if you could pardon this, closer scrutiny would prove that he had given Reynard round or dog's eyes, whereas, being nocturnal, the fox has elliptical or cat's eyes. But, happily, the taxidermists who have been in the habit of stuffing birds and animals as an upholsterer stuffs pillows are fast losing ground, and men of artistic instincts are coming to the front. These men are well grounded in anatomy, which is indispensable to proper treatment, and pay close attention to form and attitude. They study the proportion that each curve or extension, each contraction or expansion, of a particular part bears to the remainder of the body. Waterton insisted that such studies were indispensable to successful treatment; and in mounting birds' skins he discountenanced the use of wire, which, up to that time, had formed the skeleton or manikin of stuffed birds, on the ground that it introduced a disagreeable stiffness and destroyed the natural symmetry of the specimen. His plan was almost completely to skin the bird, leaving in only that portion of the skull-bone which extends from the fore part of the eyes to the bill, parts of the wing-bones, the jaw-bones, and half of the thigh-bones. With a stick shaped like a knitting-needle, he introduced cotton into the skin little by little, taking careful account of every swelling or cavity of the live bird, and of that just proportion which is so often neglected by the taxidermist.

SCARLET IBIS AND YOUNG CROCODILE. (MOUNTED BY WILLIAM T. HORNADAY.)

Those who have carefully examined a bird are aware that the feathers do not completely cover the body. There are cavities in the region of the shoulders, wings, and thighs that are comparatively bare, and in which the skin fits with extraordinary nicety. The usual manner of treating these parts is by stuffing them into rotund surfaces. This results in a certain loss of symmetry and proportion.

blood must be carefully touched with a wet sponge. In warm countries, the skin should be removed at once; elsewhere, the bird may first be allowed to grow cold. Beginning at the breast-bone, the skin is slowly removed by forcing a blunt instrument beneath it, while at the same time care should be taken not to stretch it. The bones of the wings are cut at the shoulder-joints, and, after the back of the

WOODCOCK AND YOUNG. (MOUNTED BY WILLIAM T. HORNADAY.)

Waterton exercised great care in this regard, being unwilling that even those portions of a bird which, by reason of the interposition of plumage, are hidden from the sight of the ordinary spectator, should be otherwise than true to nature. At the present time, as may be imagined, such work as Waterton's is rare,—not, however, from a lack of men capable of successfully imitating it, but for reasons which will be dwelt upon farther on in this paper.

The most approved mode of preserving a bird's skin necessitates a careful attention from the moment it is brought to bag up to the time when it is ready for mounting. The wounds must be stopped with cotton or tow, and the feathers that have been discolored by

skull is exposed, the vertebrae of the neck are separated from the head. The brains are now taken out of the skull, and the eyes are removed by breaking the little bones which separate the orbits and the roof of the mouth. From the under mandible the flesh is removed, care being taken not to injure the ear openings nor the eyelids. In the case of sea-birds, which are commonly oily, powdered chalk is profusely used. The skin is now rubbed with arsenical soap, or a solution of corrosive sublimate, and preparations are made to dry it. A copy of the notes taken when the bird was bagged, giving exact dimensions, color of eyes and legs, sex, and season of the year, should accompany

the skin. If it is to be sent far away to be mounted, the skin should be packed in a box with camphor and strong aromatics, all crevices being stopped with pitch to keep out insects. A naturalist traveling in Abyssinia laid his cured bird-skins between sheets of paper, as in an herbarium, and thus they made the voyage to England without injury, and when mounted, they made fair specimens.

Before the stuffing of a bird is begun, the skull is washed with corrosive sublimate and replaced by way of the neck. Then the wings and legs are adjusted by means of bits of wire connected with a central piece, which is made to extend longitudinally from the head to the tip of the tail, where it forms a triangle for the support of the spreading feathers or rectrices. One of the principal faults of stuffed birds is an apparent elongation of the leg. The three bones which compose the leg of a bird are articulated so as almost to form the letter Z, and though, in the case of the waders, such as the stork, the heron, and the crane, the upper joint of the thigh bone is less inclined than in the birds of the wood, it is never straight. In stuffing, an operation that must of necessity be slow, chopped flax, tow, or cotton is used. Great care must be taken not to stretch the skin or distort the parts while stuffing or sewing up. With a pair of forceps, chopped cotton is inserted into the orbits in order to prepare them for the reception of the eyes, which are affixed to the head by means of calcareous cement. Should the nictitating membrane protrude, it should be pressed back with the point of the lancet. When the pose of the bird has been decided upon and arranged, cotton thread is carefully wound round and round the plumage. This is to hold the feathers in position until the skin is thoroughly dry.

The preservation of fish-forms is a distinctive branch of taxidermy, and while many taxidermists attempt it, few are really successful. Fish, when first taken out of the water, have a bloom upon their skins that might be likened to the bloom upon a ripe plum. To retain this, they must be skinned and stuffed almost immediately after capture—say within a half hour's time—by a careful and experi-

HARLEQUIN DUCK WRAPPED. (MOUNTED BY F. S. WEBSTER.)

enced hand. According to the authorities, in order to protect the scales and colors, cambric or tissue-paper should be applied before the skin is removed. When this is effected, it is wrapped in a moist cloth to keep it pliable.

The old custom of mounting birds on twigs or moss-covered bases has largely been abandoned. Moss and all such material is the resort of insects, and when near animal matter is a favorite place for moths and the like to lay their eggs. A stand composed of two pieces of polished mahogany, or rosewood, in the shape of the letter T, affixed to an elliptical-shaped base of the same material, has been adopted by the principal museums of natural history.

The French or German taxidermist usually serves a long and laborious apprenticeship in the study of animal forms, anatomy, and drawing, before he considers himself sufficiently equipped for the practical work of his vocation. But even the skilled taxidermist, when competing for contracts, will sometimes turn out work which, if not absolutely worthless, is at least unsatisfactory. A fair example of this was recently to be seen in the Smithsonian Institution in Washington. Desiring some fine work done to serve as criteria for his own work, Professor Baird sent to Herr Martin, a famous taxidermist of Stuttgart, asking him to bid for the restoration of

TRIGGER FISH. (MOUNTED BY WILLIAM T. HORNADAY.)

a large collection of birds' skins. Now, Martin, supposing he was competing with the English and French taxidermists, made what proved to be a very low estimate, and obtained the contract. When the collection arrived from Stuttgart it was a most deplorable sight, and, so far as the study of ornithology was concerned, utterly worthless. Yet Martin has done some of the best and most conscientious work to be found on the continent of Europe. He has mounted swans so exquisitely, with such truth to nature, that it has been said that live swans could rival them in form only when they were at their very best.

What might not inappropriately be called the antithesis of Martin's cheap and inaccurate work is done by Edwin Ward, of London. Though by no means superior to that of many others, it commands by far the best price, and it is by means of this excessive price that Ward is enabled to turn out such satisfactory work. Indian officers and wealthy persons who have shown prowess in the jungle are pretty sure to save the skins for Ward to mount. Starting with an accurate knowledge of the subject, he repairs to the "Zoo," and there makes elaborate drawings of the particular subject in hand. Slowly and carefully he brings the lion, tiger, cheetah, or whatever else it may be, into its natural form and attitude. The feelers about the nose of the king of beasts stand out with their wonted vigor, the great muscles of the shoulder and flank yield gracefully to the joints which they cover, and the wire-like tendons of the herculean fore-arm may be as easily traced in the restoration as in the caged beast.

Before those famous taxidermists and hunters, the Verreaux Frères, established themselves in Paris, museums of natural history were compelled to rely upon picking up their specimens in all parts of the world. The keen intelligence of the Verreaux was not long in discovering a means of serving the cause of science and advancing their own fortunes at the same time. They established a sort of clearing-house for wild beasts, birds, fishes, and reptiles, with branches in every quarter of the globe, and from them you could order a stuffed elephant, giraffe, or Bengal tiger, as you would a fitch of bacon from your butcher or a boiled lobster from the fish-monger.

While the Verreaux were gaining a world-wide reputation, an American lad, Henry A. Ward by name, was pursuing his studies in Paris at the Sorbonne, L'École des Mines, and the Jardin des Plantes. When his means were all but exhausted, young Ward left his lodgings in the Latin Quarter and sought for fossils in the chalk and limestone quarries in the suburbs of Paris. For these he found a ready sale in London, bringing back with him to Paris fine collections of minerals purchased from the Cornwall miners. Among difficulties that would have appalled most young men, he worked his way through an elaborate course of studies, without help or encouragement. To-day, he supplies the largest museums in the world with stuffed specimens, from the elephant down to the smallest rodent, and, the Verreaux Frères being now dead, he has established, as they did, stations upon every continent for the collection of natural history specimens. At his American head-

quarters at Rochester, N. Y., there are over twenty thousand mammals, birds, fishes, and reptiles, ready for stuffing and mounting. Among these are one thousand kangaroos, one hundred tigers, three elephants, sixty bears, thirty cynocephali, one thousand serpents and snakes, two hundred seals and sea-lions, thirty orang-outang, five chimpanzees, one hundred bison and buffalo, three gorillas, and three hundred antelope.

When the news came that Corea was open to Americans, Ward at once dispatched a man

Not long ago, Ward dispatched a man to India to shoot an elephant. He obtained permission from the Governor of the Madras Presidency (for the elephant is protected by the laws), and after a long hunt, in which the natives joined, finally secured the largest stuffed specimen in the country, now in the Museum of Comparative Zoölogy at Cambridge, Mass. The elephant was shot through the head. Careful measurements were first made of the body and limbs, and then the skin was removed in three sections. One

ROOM IN A TAXIDERMIST'S SHOP.

to secure skins of the various animals indigenous to that country. A German baron, Von Hoppenfeld by name, is hunting the gorilla for him in African wilds,—a means of utilizing the German baron not previously discovered. In this quest Von Hoppenfeld has penetrated so far into the interior that he can only indicate his whereabouts by his latitude and longitude.

Ward is capable of doing quick as well as excellent work. The Fishery Exhibition of 1880 opened in Berlin, April 18th. In March, President White, of Cornell University, then United States Minister to Germany, sent to Ward, then in Paris, asking him to make an exhibit of American fishes. Two days after the opening of the exposition, an almost complete collection arrived at Berlin, consisting of fifteen hundred forms, all of which had been labeled, classified, packed, and sent from the American headquarters on a month's notice.

incision was made at the top of the neck, along the back to the tail; another divided the skin from the throat, along the middle of the body underneath, meeting the first incision at the tail; and a third cut severed the head from the body. On the inside of each leg an incision was made from the sole of the foot to the abdominal opening. The skin was removed by working from the latter and the back cuts at the same time, the legs being cut off at the joints. Then the body was rolled over, and the operation was repeated. Finally the head and trunk were skinned. The absence of hair from the skin facilitated the treatment of both sides with preservatives. Both sides were washed with arsenical soap and salt, and rubbed with a flat stone. The skin was then rolled up and packed away. Two days later it was spread out, and the pieces of flesh adhering were removed. After being again treated with arsenic, it was left undisturbed for

a week, at the expiration of which time the fibers were found to be hardened, and the epidermis thoroughly set. Powdered alum was now freely used, and the skin left to dry in the shade. Twenty days after the commencement of the operation, the skin, then weighing only two hundred and forty pounds, was shipped to America. Upon its arrival hither, four bars of wrought iron, each twelve feet long and one and a quarter inches thick, were bent into shape for the legs and firmly bolted to a beam sixteen feet long and four inches thick. This was to serve as a backbone for the attachment of ribs, pelvis, and scapulæ. Semicircular-shaped bones were attached to the backbone, and laths nailed thereon. Then a wooden pelvis and shoulder-blades were set, and at each joint of the legs a round piece of wood was fitted about the leg-iron, and laths nailed from one joint to the other. An exact copy of the skull in wood was bolted on in position. Then the several parts were wrapped with wisps of straw, and the manikin was covered with the skin of the elephant. From the measurements that had been made, the distances between the various extremities were copied, and the protrusions imitated by stuffing. The trunk was filled with straw, and the wooden imitation of the skull covered with clay and molded into shape. After the skin was thoroughly dry,—for previous to mounting it had been in the relapsing tank,—the seams were sewed together, and the elephant was complete.

PEACOCK SCREEN. (MOUNTED BY F. S. WEBSTER.)

The most difficult animals to stuff are those having short hair, such as the horse, greyhound, and giraffe. In these, the anatomy is externally prominent, and the slightest defect in the mounting becomes apparent. In ordinary work, the bones of the animal are reproduced in wood and jointed together with wire hinges. Straw rope is carefully wound about the various

SOUTH AMERICAN BLACK-FACED MONKEY. (MOUNTED BY F. S. WEBSTER.)

imitation bones until the original dimensions are reached. Then the muscles and tendons are imitated, and the skin is pinched from the outside along the line of the false tendons. In this work the taxidermist is aided by the retention by the articular surfaces of their old creases.

A serious obstacle in the path of the conscientious stuffer of animals is the inability of many of his patrons to distinguish between the ideal and the real. This can not be better illustrated than by citing the case of the buffalo. The ideal buffalo has very heavy fore legs, short neck, depressed head, and light flanks. The attitude of the ideal buffalo is always rampant. The real buffalo is disappointing in comparison. If a line were drawn midway between the end of the nose and the termination of the flanks, only three-fifths of the animal would be found forward and two-fifths back of it. But, in the ideal buffalo, three-fourths of the body is forward of this point and only one-fourth behind it. Again, the pelage is by no means so thick nor so shaggy as is usually represented. Nor is the real buffalo of threatening mien; his expression is rather one of timidity.

The most important part of the work of the taxidermist is the preservation of skins of birds and mammals. Many of the specimens mounted by taxidermists ten years

ago, some of even more recent date, which may be seen in the various museums, show signs of decay and of decomposition, while instances are not rare where the work of their predecessors is yet sound and free from blemish. In order to protect the skin of bird or mammal effectually against the assault of insects, it must be thoroughly penetrated by that which will so change its internal chemistry as to make it proof against yielding,

the shade, where the wind blows, it will soon dry without deterioration. In a good-sized bird all but the head of the humerus should be permitted to remain; in birds as large as the red-shouldered hawk, the secondaries must not be detached from the ulna. The muscles and tendons of a bird may be removed by cutting underneath the wing from the elbow and beyond. In long-legged birds and waders an incision should be made back of the heel,

SCREECH-OWL AND YOUNG. (WALL-CASE, MOUNTED BY F. S. WEBSTER.)

cracking, and other deterioration to which organic tissue is subject. According to the best authorities, a bath of arsenical solution, corrosive sublimate, or chloride of zinc, will effect this.

The metropolitan taxidermist is constantly in the receipt of skins sent in from the field, which, through the carelessness or ignorance of the owner, have been injured beyond repair. According to the best authorities, the legs and feet of a mammal and the head of a bird should be skinned. The leg bones and skull, though permitted to adhere to the skin, should be freed from flesh. The skin should be treated with arsenic or arsenical soap, dry alum or salt, or placed in strong alcohol or brine. It must not be allowed to dry while yet stained with blood, nor be stretched or left in the sun. If it is placed in

that is to say, in the tibio-tarsal joint, and another in the fleshy part of the foot, and by this means the tendon at the back of the leg should be removed. This will greatly facilitate the work of the taxidermist in wiring the leg, and will go far to preserve the scutellæ of the tarsus.

Of commercial naturalists, Frank, of Amsterdam, now dead, held high rank. He devoted himself particularly to the mammals of the Dutch archipelago. His specimens may be seen at the museum in his native city, as well as at the museums of Lyons, Bordeaux, Hamburg, Berlin, and Vienna. Hermann Plonquet, also dead, formerly of the Royal Natural History Museum in Stuttgart, excelled in preparing and mounting ornithological subjects, wisely refraining from the mammalia on the ground that a man could not do justice to both,—an

assertion, by the way, which may be verified in almost any large museum. It is said that no taxidermist has yet appeared who excels in both classes. A Pole, Bielowski by name, of the Museum of the Imperial Academy at St. Petersburg and the museum at Moscow, is said to be among the best, hav-

GOLDEN EAGLE. (MOUNTED BY F. S. WEBSTER.)

ing executed some really superior work, as the cases and corridors of the British Museum and the museums of Liverpool, Edinburgh, Florence, and Madrid will bear witness.

That there is much excellent taxidermal work done in and about New York—work that will safely vie with the best productions of European masters—few will deny; but it is also true that a vast amount of inferior work is yearly turned out. There are several reasons for this. One is that the prices now prevailing do not warrant the taxidermist in devoting the time to his work that the subject requires, and another, that a certain class of work now in popular demand does not call for, nor does it compensate, the careful attention of the master. The poulterer wishes stuffed hens for his window; the florist, swans and doves; the furrier, bears rampant; the milkman, cows couchant, and so on.

Among taxidermal curiosities, mention should be made of that department of "The Society for the Prevention of Cruelty to Ani-

mals" which might, not inappropriately, be called its Museum of Horrors, and which Mr. Henry Bergh has collected to give the emphasis of reality to his effective arguments against brutality to dumb animals. Here the taxidermist has portrayed the sufferings of the game-cock after the main; of the dog after the fight with his fellow; of the pigeon when wounded by the sportsman, and of the overdriven horse. The horrors of vivisection are graphically set forth by means of skillfully prepared animals, whose apparent sufferings, even in dumb show, it is painful to contemplate.

Several celebrated horses have been preserved by taxidermy. Sheridan's war-horse "Rienzi," which carried him to "Winchester twenty miles away," may be seen on Governor's Island. Sherman's famous horse "Tecumseh," which he rode "from Atlanta to the sea," is in the University of Wisconsin, at Madison, and General Robert E. Lee's war-horse "Traveller" is in the museum of the Washington and Lee University, Virginia. The famous trotter "Lexington" was recently exhumed on Alexander's breeding-farm in Kentucky, and remodeled from a sketch taken during life.

One of the first objects to catch the eye of the visitor in the Arsenal, in Central Park, is a group representing an Arab courier attacked by lions. This is a masterpiece from the hands of the late Édouard Verreaux, of Paris, and at the Exposition of 1867, where it was greatly admired, secured a gold medal. Hard by is a grizzly bear, stuffed nearly half a century ago, but, owing to the care of Superintendent Conklin, it does not yet show signs of deterioration.

An important branch of the taxidermist's business is the stuffing of favorite animals and birds. Conspicuously displayed at one New York shop is a sign with the legend, "Cats and dogs must be paid for in advance!" This is only a necessary precaution of the taxidermist to protect himself from loss. His most frequent visitors are women who have lost a pet dog or cat. At first the mistress is inconsolable, and orders her favorite stuffed and mounted in the best manner. This requires time, and when the work is done its owner has usually so far recovered from her grief as to be indifferent concerning it. Were it a bird of fine plumage or a rare animal, the taxidermist would be willing to have it left on his hands; but there is no demand for miscellaneous stuffed cats and dogs. It is remarkable how many canaries are brought to be mounted. "Here's 'Dickie!'" says a little girl as she enters the shop, and, carefully unwinding a handkerchief, takes out a diminutive

tive yellow bird. "Ma wants you to stuff 'm!" Then she whispers tearful directions regarding her pet, concluding with: "You must make him look just exactly as if he was alive."

Skins of birds and animals from all over the country are sent to New York to be mounted. Oftentimes the owner desires information regarding the curious changes of color in the plumage, particularly of shore birds, or regarding that *crux* of ornithological science, "What constitutes a species?" Many ornithologists throughout the country rely upon pictorial representation to decide upon bird-forms, and while there are some very accurate ornithological publications to be had, it is a well-known fact that the market is flooded with works illustrated from badly stuffed specimens instead of from live or freshly killed birds.

A serious obstacle in the path of taxidermal progress has been the unwillingness of American taxidermists to compare notes. The physician, the surgeon, and the scientist publish to the world the results of their experiments, and to keep secret important discoveries for purposes of money-getting is looked upon by the members of these several fraternities as a species of quackery. Such has not been the case among taxidermists. If a man by experiment has learned a better method of restoring skins, or protecting them from the attack of parasites, it has been his habit to conceal the discovery from other members of his guild. Two years ago the Society of American Taxidermists was organized, with a view of bringing the workmen together. The first meeting was held at Rochester, N. Y., the second at Boston, Mass., and the third is about to be held in New York city, under the auspices of the American Museum of Natural History. At these meetings the best work done in the country is placed on exhibition. Notable features in the last meeting were an excellent taxidermal representation of the story of Cock Robin, and a chorus of open-mouthed birds perched upon a bough, with one of their number armed with a baton as leader. There were also mammals in groups, and many single specimens of birds, mammals, and fishes. The specialists openly ply their several branches of the taxidermal art each day of the exhibition, and thus the spectator may enlarge his knowledge of the art without hinderance. The officers of the society say that there are already signs of improvement in American taxidermy. At former exhibitions old workmen have obtained valuable hints from sources which at first seemed unpromising,

A GROTESQUE.

while the younger members of the guild have been partly disabused of the idea that celerity of execution will make amends for inartistic treatment.

There is a species of taxidermy which might not inappropriately be called "plastic," and of which Mr. P. T. Barnum, if not the originator, is at least a patron. In this, fabulous or costly specimens are modeled out of parts of other and not necessarily similar natural forms. Several years since, a New York taxidermist constructed a whale thirty-six feet long. It was made like a balloon, to be blown up with gas. The covering was silk, upon which dog-fish and shark-skins were carefully attached. The jaws were made to work like an alligator's, and the interior of the mouth was lined with whalebone. This whale was purchased by a Western showman, for whom it proved a phenomenal attraction. Its career as a curiosity was, however, brought to a close by an accident which could hardly have been foreseen by either its builder or its owner. Contrary to his usual custom, the latter permitted its exhibition in a tent at a county fair. The man employed to describe in stentorian tones the habits of the "monsters of the deep" had arrived at about the middle of his discourse, when a cross-beam fell from the peak of the tent and struck the whale in the back. There was a sharp, hissing sound as the gas escaped, and the whale gradually flattened. "There she blows!" shouted one of the surrounding rustics, and whales ceased to draw in that part of the West.

Franklin H. North.

## RAB'S FRIEND.

DR. JOHN BROWN AND RAB.

TO SAY what ought to be said concerning Dr. John Brown, a man should have known him well and long, and should remember much of that old generation of Scotchmen to which the author of "Rab and his Friends" belonged. But that generation has departed. One by one these wits and scholars of the North, these *epigoni*, who were not, indeed, of the heroes, but who had seen and remembered Scott and Wilson, have passed away. Aytoun and Carlyle and Dr. Burton, and last, Dr. Brown, are gone. In her recent memoir of Dr. Burton,—the historian of Scot-

land, and author of "The Book-hunter,"—Mrs. Burton remarks that, in her husband's later days, only Dr. John Brown and Professor Blackie remained of all her husband's ancient friends and coevals, of all who remembered Lockhart, and Hogg, and their times. But many are left who knew Dr. Brown far better and more intimately than the author of this notice. I can hardly say when I first became acquainted with him; probably it was in my childhood. Ever since I was a boy, certainly, I have seen him at intervals, especially in the Christmas vacations. But he seldom moved

from Edinburgh, except in summer, which he frequently passed in the country house of certain friends of his, whose affection made much of the happiness of his latest years, and whose unfailing kindness attended him in his dying hours. Living always in Scotland, Dr. Brown was seen but rarely by his friends who resided in England. Thus, though Dr. Brown's sweetness of disposition and charm of manner, his humor, and his unfailing sympathy and encouragement, made one feel toward him as to a familiar friend, yet, of his actual life I saw but little, and have few reminiscences to contribute. One can only speak of that singular geniality of his, that temper of goodness and natural tolerance and affection, which, as Scotchmen best know, is so rare among the Scotch. Our race does not need to pray, like the mechanic in the story, that Providence will give us "a good conceit of ourselves." But we must acknowledge that the Scotch temper is critical if not captious, argumentative, inclined to look at the seamy side of men and of their performances, and to dwell on imperfections rather than on merits and virtues. An example of these blemishes of the Scotch disposition, carried to an extreme degree in the nature of a man of genius, is offered to the world in the writings and "Reminiscences" of Mr. Carlyle. Now, Dr. John Brown was at the opposite pole of feeling. He had no mawkish toleration of things and people intolerable, but he preferred not to turn his mind that way. His thoughts were with the good, the wise, the modest, the learned, the brave of times past, and he was eager to catch a reflection of their qualities in the characters of the living, of all with whom he came into contact. He was, for example, almost optimistic in his estimate of the work of young people in art or literature. From everything that was beautiful or good, from a summer day by the Tweed, or from the eyes of a child, or from the humorous saying of a friend, or from treasured memories of old Scotch worthies, from recollections of his own childhood, from experience of the stoical heroism of the poor, he seemed to extract matter for pleasant thoughts of men and the world, and nourishment for his own great and gentle nature. I have never known any man to whom other men seemed so dear,—men dead, and men living. He gave his genius to knowing them, and to making them better known, and his unselfishness thus became not only a great personal virtue, but a great literary charm. When you met him, he had some "good story" or some story of goodness to tell,—for both came alike to him, and his humor was as unfailing as his kindness. There was in his face a singular charm,

blended, as it were, of the expressions of mirth and of patience. Being most sensitive to pain, as well as to pleasure, he was an exception to that rule of Rochefoucauld's,—"*nous avons tous assez de force pour supporter les maux d'autrui.*"\* He did not bear easily the misfortunes of others, and the evils of his own lot were heavy enough. They saddened him; but neither illness, nor his poignant anxiety for others, could sour a nature so unselfish. He appeared not to have lost that anodyne and consolation of religious hope, which had been the strength of his forefathers, and was his best inheritance from a remarkable race of Scotchmen. Wherever he came, he was welcome; people felt glad when they had encountered him in the streets,—the streets of Edinburgh, where almost every one knows every one by sight,—and he was at least as joyously received by the children and the dogs as by the grown-up people of every family. A friend has kindly shown me a letter in which it is told how Dr. Brown's love of dogs, his interest in a half blind old Dandy which was attached to him, was evinced in the very last hours of his life. But enough has been said, in general terms, about the character of "the beloved physician," as Dr. Brown was called in Edinburgh, and a brief account may be given, in some detail, of his life and ways.

Dr. John Brown was born in Biggar, one of the gray, slaty-looking little towns in the pastoral moorlands of southern Scotland. These towns have no great beauty that they should be admired by strangers, but the natives, as Scott said to Washington Irving, are attached to their "gray hills," and to the Tweed, so beautiful where man's greed does not pollute it, that the Border people are all in love with it, as Tyro, in Homer, loved the divine Enipeus. We hold it "far the fairest of the floods that run upon the earth." How dear this border scenery was to Dr. John Brown, and how well he knew and could express its legendary magic, its charm woven of countless ancient spells, the music of old ballads, the sorcery of old stories, may be understood by readers of his essay on "Minchmoor."† The father of Dr. Brown was the third in a lineage of ministers of the sect called Seceders. To explain who the Seceders were, it would be necessary to explore the sinking morasses of Scotch ecclesiastical history. The minister was proud of being not only a "Seceder" but a "Burgher." He inherited, to be brief, the traditions of a most spiritually minded and most spirited set of

\* It is easy to bear the misfortunes of others.

† In the third volume of his essays.

men, too much bent, it may appear to us, on establishing delicate distinctions of opinions, but certainly most true to themselves and to their own ideals of liberty and of faith. Dr. Brown's great-grandfather had been a shepherd boy, who taught himself Greek that he might read the New Testament; who walked twenty-four miles—leaving his folded sheep in the night—to buy the precious volume in St. Andrews, and who, finally, became a teacher of much repute among his own people. Of Dr. Brown's father, he himself wrote a most touching and beautiful account in his "Letter to John Cairns, D. D." This essay contains, perhaps, the very finest passages that the author ever penned. His sayings about his own childhood remind one of the manner of Lamb, without that curious fantastic touch which is of the essence of Lamb's style. The following lines, for example, are a revelation of childish psychology, and probably may be applied, with almost as much truth, to the childhood of our race:

"Children are long of seeing, or at least of looking at what is above them; they like the ground, and its flowers and stones, its 'red sodgers' and lady birds, and all its queer things; *their world is about three feet high*, and they are more often stooping than gazing up. I know I was past ten before I saw, or cared to see, the ceilings of the rooms in the manse at Biggar."

I have often thought that the earliest fathers of our race, child-like in so many ways, were child-like in this, and worshiped, not the phenomena of the heavens, but objects more on a level with their eyes,—the "queer things" of their low-lying world. In this essay on his father, Dr. Brown has written lines about a child's first knowledge of death, which seem as noteworthy as Steele's famous passage about his father's death and his own half-conscious grief and anger. Dr. Brown describes a Scottish funeral—the funeral of his own mother—as he saw it with the eyes of a boy of five years old, while his younger brother, a baby of a few months,

"leaped up and crowed with joy at the strange sight,—the crowding horsemen, the coaches, and the nodding plumes of the hearse. \* \* \* Then, to my surprise and alarm, the coffin, resting on its bearers, was placed over the dark hole, and I watched with curious eye the unrolling of those neat black bunches of cords, which I have often enough seen since. My father took the one at the head, and also another much smaller, springing from the same point as his, which he had caused to be placed there, and unrolling it, put it into my hand. I twisted it firmly round my fingers, and awaited the result; the burial men with their real ropes lowered the coffin, and when it rested at the bottom it was too far down for me to see it. The grave was made very deep, as he used afterward to tell us, that it might hold us all. My father first and

abruptly let his cord drop, followed by the rest. This was too much. I now saw what was meant, and held on and fixed my fist and feet, and I believe my father had some difficulty in forcing open my small fingers; he let the little black cord drop, and I remember, in my misery and anger, seeing its open end disappearing in the gloom."\*

The man who wrote this, and many another passage as true and tender, might surely have been famous in fiction, if he had turned his powers that way. He had imagination, humor, pathos; he was always studying and observing life; his last volume, especially, is like a collection of fragments that might have gone toward making a work, in some ways not inferior to the romances of Scott. When the third volume of Essays was published, in the spring of this year, a reviewer, who apparently had no personal knowledge of Dr. Brown, asked why he did not write a novel. He was by that time over seventy years of age, and, though none guessed it, within a few weeks of his death. What he might have done, had he given himself to literature only, it is impossible to guess. But he caused so much happiness, and did so much good, in that gentle profession of healing which he chose, and which brought him near to many who needed consolation more than physic, that we need not regret his deliberate choice. Literature had only his *horæ Subsecivæ*, as he said: *Subsecivæ quadam tempora quæ ego perire non patior*, as Cicero writes, "shreds and waste ends of time, which I suffer not to be lost."

The kind of life which Dr. Brown's father and his people lived at Biggar, the austere life of work, and of thought intensely bent on the real aim of existence, on God, on the destiny of the soul, is perhaps rare now, even in rural Scotland. From what one reads in American books, this earnest and always present interest in spiritual things is more common among the rural people of the United States, who are described as obedient to the motto of that ring found on Magus Moor, where Archbishop Shairp was murdered, *Remember upon Death*. If any reader has not yet made the acquaintance of Dr. Brown's works, one might counsel him to begin with the "Letter to John Cairns, D. D.," the fragment of biography and autobiography; the description of the fountain-heads from which the genius of the author flowed. In his early boyhood,

\* "I remember I went into the room where my father's body lay, and my mother sat weeping alone by it. I had my battledore in my hand, and fell a-beating the coffin and calling 'Papa,' for, I know not how, I had some slight idea that he was locked up there."—Steele, "The Tatler," June 6, 1710.

John Brown was educated by his father, a man who, from his son's affectionate description, seems to have confined a fiery and romantic genius within the channels of Seceder and Burgher theology. When the father received a call to the "Rose Street Secession Church," in Edinburgh, the son became a pupil of that ancient Scotch seminary, the High School,—the school where Scott was taught not much Latin and no Greek worth mentioning. Scott was still alive and strong in those days, and Dr. Brown describes how he and his school companions would take off their hats to the Shirra as he passed in the streets. "Though lame, he was nimble, and all rough and alive with power; had you met him anywhere else, you would say he was a Liddesdale store farmer, come of gentle blood,—'a stout, blunt carle,' as he says of himself, with the swing and stride and the eye of a man of the hills,—a large, sunny, out-of-door air all about him. On his broad and stooping shoulders was set that head which, with Shakspeare's and Bonaparte's, is the best known in all the world." Scott was then living in 39 Castle street. I do not know whether the American pilgrims, whom one meets moving constantly in the direction of Melrose and Abbotsford, have thought of making pilgrimage to Castle street, and to the grave, there, of Scott's "dear old friend,"—his dog Camp. Of Dr. Brown's school-boy days, one knows little,—days when "Bob Ainslie and I were coming up Infirmary street from the High School, our heads together, and our arms intertwined, as only lovers and boys know how or why." Concerning the doctor's character, he has left it on record that he liked a dog-fight. "'A dog-fight,' shouted Bob and was off, and so was I, both of us all hot, praying that it might not be over before we were up. \* \* \* Dogs like fighting; old Isaac [Watts, not Walton] says they 'delight' in it, and for the best of all reasons; and boys are not cruel because they like to see the fight. This is a very different thing from a love of making dogs fight." And this was the most famous of all dog-fights,—since the old Irish Brehons settled the laws of that sport, and gravely decided what was to be done if a child interfered, or an idiot, or a woman, or a one-eyed man,—for this was the dog-fight in which Rab first was introduced to his historian. Six years passed after this battle, and Dr. Brown was a medical student and a clerk at Minto Hospital. How he renewed his acquaintance there, and in what sad circumstances, with Rab and his friends, it is superfluous to tell, for every one who reads at all has read that story, and

most readers not without tears. As a medical student in Edinburgh, Dr. Brown made the friendship of Mr. Syme, the famous surgeon,—a friendship only closed by death. I only saw them once together, a very long time ago, and then from the point of view of a patient. These occasions are not agreeable, and patients, like the old cock which did not crow when plucked, are apt to be "very much absorbed"; but Dr. Brown's attitude toward the man whom he regarded with the reverence of a disciple, as well as with the affection of a friend, was very remarkable. When his studies were over, Dr. Brown practised for a year as assistant to a surgeon in Chatham. It must have been when he was at Chatham that a curious event occurred. Many years later, Charles Dickens was in Edinburgh, reading his stories in public, and was dining with some Edinburgh people. Dickens began to speak about the panic which the cholera had caused in England: how ill some people had behaved. As a contrast, he mentioned that, at Chatham, one poor woman had died, deserted by every one except a young physician. Some one, however, ventured to open the door, and found the woman dead, and the young doctor asleep, overcome with the fatigue that mastered him on his patient's death, but quite untouched by the general panic. "Why that was Dr. John Brown," one of the guests observed; and it seems that, thus early in his career, the doctor had been setting an example of the courage and charity of his profession. After a year spent in Chatham, he returned to Edinburgh, where he spent the rest of his life, busy partly with his art of healing, partly with literature. He lived in Rutland street, near the railway station, by which Edinburgh is approached from the west, and close to Prince's street, the chief street of the town, separated by a green valley, once a loch, from the high Castle Rock. A view of the drawing-room in the house in Rutland street accompanies this paper. It was the room in which his friends were accustomed to see Dr. Brown, and a room full of interest it was. In his long life, the doctor had gathered round him many curious relics of artists and men of letters; a drawing of a dog by Turner I remember particularly, and a copy of "Don Juan," in the first edition, with Byron's manuscript notes. Dr. Brown had a great love and knowledge of art and of artists, from Turner to Leech; and he had very many friends among men of letters, such as Mr. Ruskin and Mr. Thackeray. Dr. Brown himself was a clever designer of rapid little grotesques, rough sketches of dogs and men. One or

DR. JOHN BROWN'S DRAWING-ROOM.\*

two of them are engraved in the little paper-covered booklets in which some of his essays were separately published,—booklets which he was used to present to people who came to see him and who were interested in all that he did [see next page]. I remember some vivacious grotesques which he drew for one of my brothers when we were school-boys. These little things were carefully treasured by boys who knew Dr. Brown, and found him friendly, and capable of sustaining a conversation on the points of a Dandy Dinmont terrier and other mysteries important to youth. He was a bibliophile,—a taste which he inherited from his father, who “began collecting books

when he was twelve, and was collecting up to his last hours.” The last time I ever saw Dr. Brown, about a year ago, he was kind enough to lend me one of the rarest of his treasures, “Poems,” by Mr. Ruskin. Probably Mr. Ruskin had presented the book to his old friend; in no other way were it easy to procure writings which the author has withdrawn from publication, if, indeed, they ever were, properly speaking, published. Thus Dr. Brown was all things to all men, and to all boys. He “had a word for every one,” as poor people say, and a word to the point, for he was as much at home with the shepherd on the hills, or with the

\* “The room is crowded with pictures, engravings, books, and pretty things of all kinds,—nothing, perhaps, very valuable, but nearly all of them with a history—nearly all given to him, in one way or another, by some one who admired or loved him. The frame in the middle line, on the extreme right of the fireside, contains five of Leech's little original drawings; and there is a famous larger one on the same line, beyond the head of Tennyson, while beneath is the grand Goldsmith, ‘in his new suit,’ from Thackeray's ‘Humorists.’ The black picture diagonally to the right, above him, contains the original sketch by George Harvey, of the girl's head (including his daughter and Dr. Brown's) made for his picture of ‘Leaving the Manse,’ and afterward utilized as ‘Rab's Friends’ in the illustrated edition. Above the bust, to the left, is the best of the heads of ‘Rab,’ by the very clever young animal painter, Edwin Douglass. The white frame to the left of the gas-globe shows, by a slight penciled profile likeness, the beautiful head of Mrs. Brown in her prime; that partially concealed by the other glass globe is her likeness as a young girl, and immediately below it is her bust, the other bust on the mantelpiece being that of Dr. John Scott, the Edinburgh physician, while the portrait behind is that of John Scott of the ‘London Magazine,’ who was an uncle or cousin of Mrs. Brown. The engraving in middle line, immediately to the left of the mantelpiece, is Turner's ‘Devil's Bridge,’ over the Reuss in the Altdorf Valley; and the bull-dog's head to the left of it,—a fine engraving,—bears the inscription: ‘Not an approach to the great Rab, but—Yours truly, E. Landseer.’ The pictures to the left of young John's bust are, first, a very beautiful and characteristic landscape of Harvey's,—much akin in character to that engraved in the illustrated Rab,—for ‘Rab's Grave’: and, next, a small, but very good likeness of old Dr. Brown, Dr. Brown's father. There is also a wonderfully clever spaniel dog drawn by Turner, and a drawing by Ruskin, both being, I think, presented by Ruskin. Of the books on the table, may be noticed two volumes of O. W. Holmes's poetical works, the gift of the ‘Autocrat,’ with a letter which gave Dr. Brown as much pleasure as anything that had come to him for years.”—*From a letter from a friend of Dr. Brown.*

angler between Hollylea and Clovenford, as with the dusty book-hunter, or the doggy young Border yeoman, or the child who asked him to "draw her a picture," or the friend of genius famous through all the world, Thackeray, when he "spoke, as he seldom did, of divine things."

Three volumes of essays are all that Dr. Brown has left in the way of compositions: a light, but imperishable literary baggage. His studies are usually derived from personal experience, which he reproduced with singular geniality and simplicity, or they are drawn from the tradition of the elders, the reminiscences of long-lived Scotch people, who, themselves, had listened attentively to those who went before them. Since Scott, these ancient ladies with wonderful memories have had no such attentive listener or appreciative reporter as Dr. Brown. His paper called "Mystifications," a narrative of the pranks of Miss Stirling Graham, is a brief, vivid record of the clever and quaint society of Scotland sixty years ago. Scotland, or at least Scottish society, is now only English society,—a little narrower, a little prouder, sometimes even a little duller. But old people of position spoke the old Scotch tongue sixty years ago, and were full of wonderful genealogies, full of reminiscences of "the '45," and the adventures of the Jacobites. The very last echoes of that ancient world are dying now from memory, like the wide reverberations of that gun which Miss Nelly MacWilliam heard on the day when Prince Charles landed, and which resounded strangely all through Scotland. The children of this generation, one fears, will hardly hear of these old raids and duels, risings and rebellions, by oral tradition handed down, unbroken, through aunts and grandmothers. Scott reaped a full, late harvest of the mem-

THE DUCHESS. [FROM "OUR DOGS."]

ories of clannish and feudal Scotland; Dr. Brown came as a later gleaner, and gathered these stirring tales of "A Jacobite Family" which are published in the last volume of his essays. When he was an observer, not a hearer only, Dr. Brown chiefly studied and best wrote of the following topics: passages and characters of humor and pathos

ORAT, FLORAT, ET ADORAT. [FROM "OUR DOGS."]

which he encountered in his life and profession; children, dogs, Border scenery, and fellow-workers in life and science. Under one or other of these categories all his best compositions might be arranged. The most famous and most exquisite of all his works in the first class is the unrivaled "Rab and his Friends"—

a study of the stoicism and tenderness of the Lowland character worthy of Scott. In a minor way the little paper on "Jeems," the doorkeeper in a Dissenting house of the Lord, is interesting to Scotch people, though it must seem a rather curious revelation to all others. "Her Last Half Crown" is another study of the honesty that survived in a starving and outcast Scotch girl, when all other virtues, as we commonly reckon virtue, had gone before her character to some place where, let us hope, they may rejoin her; for if we are to suffer for the vices which have abandoned us, may we not get some credit for the virtues that we have abandoned, but that once were ours, in some heaven paved with bad resolutions unfulfilled? "The Black Dwarf's Bones" is a sketch of the misshapen creature from whom Scott borrowed the character that gives a name to one of his minor Border stories. The real Black Dwarf (David Ritchie he was called among men) was fond of poetry, but hated Burns. He was polite to the fair, but classed mankind at large with his favorite aversions: ghosts, fairies, and robbers. There

WULL OO RIPP'ER UP NOO? [FROM "JEEMS, THE DOORKEEPER."]

was this of human about the Black Dwarf, that "he hated folk that are aye gaun to dee, and never do't." The village beauties were wont to come to him for a Judgment of Paris on their charms, and he presented each with a flower, which was of a fixed value in his standard of things beautiful. One kind of rose, the prize of the most fair, he only gave thrice. Paris could not have done his dooms more courteously, and, if he had but made judicious use of rose, lily, and lotus, as prizes, he might have pleased all the three Goddesses; Troy still might be standing, and the lofty house of King Priam.

Among Dr. Brown's papers on children, that called "Pet Marjorie" holds the highest place. Perhaps certain passages are "wrote too sentimentally," as Marjorie Fleming herself remarked about the practice of many authors. But it was difficult to be perfectly composed when speaking of this wonderful fairy-like little girl, whose affection was as warm as her humor and genius were precocious. "Infant phenomena" are seldom agreeable, but Marjorie was so humorous, so quick-tempered, so kind, that we cease to regard her as an intellectual "phenomenon." Her memory remains sweet and blossoming in its dust, like that of little Penelope Boothby, the child in the mob cap whom Sir Joshua painted, and who died very soon after she was thus made immortal. It is superfluous to quote from the essay on Marjorie Fleming; every one knows about her and her studies: "Isabella is teaching me to make simme collings, nots of interrignations, peorids, commoes, etc." Here is a Shaksperian criticism, of which few but Mr. Burnand (who thinks Shakspeare tedious to a nineteenth century audience) will deny the correctness: "*Macbeth* is a pretty composition, but awful one." Again, "I never read sermons of any kind, but I read novelettes and my Bible." "Tom Jones and Gray's Elegey in a country churchyard are both excellent, and much spoke of by both sex, particularly by the men." Her Calvinistic belief in "*unquestionable* fire and brimston" is unhesitating, but the young theologian appears to have substituted "unquestionable" for "unquenchable." There is something humorous in the alteration, as if Marjorie refused to be put off with an "excellent family substitute" for fire and brimstone, and demanded the "unquestionable" article, no other being genuine, please observe trade-mark.

Among Dr. Brown's contributions to the humorous study of dogs, "Rab," of course, holds the same place as Marjorie among his sketches of children. But as his "Queen Mary's Child Garden," the description of the

little garden which Mary Stuart played in when a child, is second to "Marjorie," so "Our Dogs" is a good second to "Rab." Perhaps Dr. Brown never wrote anything more mirthful than his description of the sudden birth of the virtue of courage in Toby, a comic but cowardly mongrel, a cur of low degree.

"Toby was in the way of hiding his culinary bones in the small gardens before his own and the neighboring doors. Mr. Scrymgeour, two doors off, a bulky, choleric, red-haired, red-faced man—*torvo vultu*—was, by law of contrast, a great cultivator of flowers, and he had often scowled Toby into all but non-existence by a stamp of his foot and a glare of his eye. One day, his gate being open, in walks Toby with a huge bone, and making a hole where Scrymgeour had two minutes before been planting some precious slip, the name of which on paper and on a stick Toby made very light of, substituted his bone, and was engaged covering it, or thinking he was covering it up with his shovelling nose, when S. spied him through the inner glass door, and was out upon him, like the Assyrian, with a terrific *gowl*. I watched them. Instantly Toby made at him with a roar, too, and an eye more torve than Scrymgeour's, who, retreating without reserve, fell prostrate, there is reason to believe, in his own lobby. Toby contented himself with proclaiming his victory at the door, and, returning, finished his bone-planting at his leisure; the enemy, who had scuttled behind the glass-door, glaring at him. From this moment Toby was an altered dog. Pluck at first sight was lord of all. \* \* \* That very evening he paid a visit to Leo, next door's dog, a big tyrannical bully and coward. \* \* \* To him Toby paid a visit that very evening, down into his den, and walked about, as much as to say, 'Come on, Macduff'; but Macduff did not come on."

This story is one of the most amazing examples of instant change of character on record, and disproves the skeptical remark that "no one was ever converted, except prize-fighters, and colonels in the army." I am sorry to say that Dr. Brown was too fond of dogs to be very much attached to cats. I never heard him say anything against cats, or, indeed, against anybody; but there are passages in his writings which tend to show that, when young and thoughtless, he was not far from regarding cats as "the higher vermin." He tells a story of a Ghazi puss, so to speak, a victorious cat, which, intrenched in a drain, defeated three dogs with severe loss, and finally escaped unharmed from her enemies. Dr. Brown's family gloried in the possession of a Dandy Dinmont named John Pym, whose cousin (Auld Pepper) belonged to one of my brothers. Dr. Brown was much interested in Pepper, a dog whose family pride was only matched by that of the mother of Candide, and, at one time, threatened to result in the extinction of this branch of the House of Pepper. Dr. Brown had remarked, and my own observations confirm it, that when a Dandy is not game, his apparent lack of courage arises "from kindness of heart."

Among Dr. Brown's landscapes, as one may call his descriptions of scenery, and of the ancient historical associations with Scotch scenery, "Minchmoor" is the most important. He had always been a great lover of the Tweed. The walk which he commemorates in "Minchmoor" was taken, if I am not mistaken, in company with Principal Shairp, Professor of Poetry in the University of Oxford, and author of one of the most beautiful of Tweedside songs, a modern "Bush aboon Traquair":

"And what saw ye there,  
At the bush aboon Traquair;  
Or what did ye hear that was worth your heed?  
I heard the cushie croon  
Thro' the gowden afternoon,  
And the Quair burn singing doun to the vale o' Tweed."

American pilgrims to the country of Scott will find no pleasanter walk than that which Dr. Brown took in the summer afternoon. Within a few miles, many places famous in history and ballad may be visited: the road by which Montrose's men fled from Philiphaugh fight; Traquair House, with the bears on its gates, as on the portals of the Baron of Bradwardine; Williamhope, where Scott and Mungo Park, the African explorer, went their several ways. From the crest of the road you see all the Border hills, the Maiden Paps, the Eildons cloven in three, the Dunion, the Windburg, and so to the distant Cheviots, and Smailholme Tower, where Scott lay when a child, and clapped his hands at the flashes of the lightning, *haud sine Dis animosus infans*, like Horace. From the crest of the hill you follow Dr. Brown into the valley of Yarrow, and the deep black pools, now called the "dowie dens," and so, "through the pomp of cultivated nature," as Wordsworth says, to the railway at Selkirk, passing the plain where Janet won back Tamlane from the queen of the faeries. All this country was familiar to Dr. Brown, and on one of the last occasions when I met him, he was living at Hollylea, on the Tweed, just above Ashiestiel, Scott's home while he was happy and prosperous, before he had the unhappy thought of building Abbotsford. At the time I speak of, Dr. Brown had long ceased to write, and his health suffered from attacks of melancholy, in which the world seemed very dark to him. I have been allowed to read some letters which he wrote in one of these intervals of depression. With his habitual unselfishness, he kept his melancholy to himself, and, though he did not care for society at such times, he said nothing of his own condition that could distress his correspondent. In the last year of his life, everything around him seemed to brighten: he was unusually well, he even re-

turned to his literary work, and saw his last volume of collected essays through the press. They were most favorably received, and the last letters which I had from him spoke of the pleasure which this success gave him. Three editions of his book ("John Leech, and Other Essays") were published in some six weeks. All seemed to go well, and one might even have hoped that, with renewed strength, he would take up his pen again. But his strength was less than we had hoped. A cold settled on his lungs, and, in spite of the most affectionate nursing, he grew rapidly weaker. He had little suffering at the end, and his mind remained unclouded. No man of letters could be more widely regretted, for he was the friend of all who read his books, as, even to people who only met him once or twice in life, he seemed to become dear and familiar.

In writing of Dr. Brown in an American periodical, one ought not to forget to say that his popularity in America was probably greater than in his own country. He was often visited by Americans whom he hospitably received. The praise which Dr. Wendell Holmes gave his work afforded him much pleasure. Mr. Clemens was also among his friends. Of Americans he said: "They are more alive than we are."

In one of his very latest writings, "On Thackeray's Death," Dr. Brown told people (what some of them needed, and still need to be told) how good, kind, and thoughtful for others was our great writer,—our greatest master of fiction, I venture to think, since Scott. Some of the lines Dr. Brown wrote of Thackeray might be applied to himself: "He looked always fresh, with that abounding silvery hair, and his young, almost infantine face"—a face very pale, and yet radiant, in his last years, and mildly lit up with eyes full of kindness, and softened by sorrow. In his last year, Mr. Swinburne wrote to Dr. Brown this sonnet, in which there seems something of the poet's prophetic gift, and a voice sounds as of a welcome home.

"Beyond the north wind lay the land of old,  
Where men dwelt blithe and blameless, clothed  
and fed  
With joy's bright raiment, and with love's sweet  
bread,—  
The whitest flock of earth's maternal fold.  
None there might wear about his brows enrolled  
A light of lovelier fame than rings your head,  
Whose lonesome love of children and the dead  
All men give thanks for; I, far off, behold  
A dear dead hand that links us, and a light  
The blithest and benignant of the night,—  
The night of death's sweet sleep, wherein may be  
A star to show your spirit in present sight  
Some happier isle in the Elysian sea  
Where Rab may lick the hand of Marjorie."

Andrew Lang.

## THE POINT OF VIEW.

### I.

FROM MISS AURORA CHURCH,\* AT SEA, TO  
MISS WHITESIDE, IN PARIS.

\* \* \* My dear child, the bromide of sodium (if that's what you call it) proved perfectly useless. I don't mean that it did me no good, but that I never had occasion to take the bottle out of my bag. It might have done wonders for me if I had needed it; but I didn't, simply because I have been a wonder myself. Will you believe that I have spent the whole voyage on deck, in the most animated conversation and exercise? Twelve times round the deck makes a mile, I believe; and by this measurement I have been walking twenty miles a day. And down to every meal, if you please, where I have displayed the appetite of a fish-wife. Of course the weather has been lovely; so there's no great merit. The wicked old Atlantic has been as blue as the sapphire in my only ring (a rather good one), and as smooth as the slippery floor of Madame Galopin's dining-room. We have been for the last three hours in sight of land, and we are soon to enter the Bay of New York, which is said to be exquisitely beautiful. But of course you recall it, though they say that everything changes so fast over here. I find I don't remember anything, for my recollections of our voyage to Europe, so many years ago, are exceedingly dim; I only have a painful impression that Mamma shut me up for an hour every day in the state-room, and made me learn by heart some religious poem. I was only five years old, and I believe that as a child I was extremely timid; on the other hand, Mamma, as you know, was dreadfully severe. She is severe to this day; only I have become indifferent; I have been so pinched and pushed—morally speaking, *bien entendu*. It is true, however, that there are children of five on the vessel to-day who have been extremely conspicuous,—ranging all over the ship, and always under one's feet. Of course they are little compatriots, which means that they are little barbarians. I don't mean that all our compatriots are barbarous; they seem to improve, somehow, after their first communion. I don't know whether it's that ceremony that improves them,—especially as so few of them go in for

\* The author takes the liberty of referring the reader to a little tale entitled "The Pension Beaurepas."

it; but the women are certainly nicer than the little girls; I mean, of course, in proportion, you know. You warned me not to generalize, and you see I have already begun, before we have arrived. But I suppose there is no harm in it so long as it is favorable. Isn't it favorable when I say that I have had the most lovely time? I have never had so much liberty in my life, and I have been out alone, as you may say, every day of the voyage. If it is a foretaste of what is to come, I shall take to that very kindly. When I say that I have been out alone, I mean that we have always been two. But we two were alone, so to speak, and it was not like always having Mamma, or Madame Galopin, or some lady in the *pension*, or the temporary cook. Mamma has been very poorly; she is so very well on land, it's a wonder to see her at all taken down. She says, however, that it isn't the being at sea; it's, on the contrary, approaching the land. She is not in a hurry to arrive; she says that great disillusionments await us. I didn't know that she had any illusions—she's so stern, so philosophic. She is very serious; she sits for hours in perfect silence, with her eyes fixed on the horizon. I heard her say yesterday to an English gentleman—a very odd Mr. Antrobus, the only person with whom she converses—that she was afraid she shouldn't like her native land, and that she shouldn't like not liking it. But this is a mistake—she will like that immensely (I mean not liking it). If it should prove at all agreeable, Mamma will be furious, for that will go against her system. You know all about Mamma's system; I have explained that so often. It goes against her system that we should come back at all; that was *my* system—I have had at last to invent one! She consented to come only because she saw that, having no *dot*, I should never marry in Europe; and I pretended to be immensely preoccupied with this idea, in order to make her start. In reality *cela m'est parfaitement égal*. I am only afraid I shall like it too much (I don't mean marriage, of course, but one's native land). Say what you will, it's a charming thing to go out alone, and I have given notice to Mamma that I mean to be always *en course*. When I tell her that, she looks at me in the same silence; her eye dilates, and then she slowly closes it. It's as if the sea were affecting her a little, though it's so beautifully calm. I ask her if she will try my bromide, which is

there in my bag; but she motions me off, and I begin to walk again, tapping my little boot-soles upon the smooth, clean deck. This allusion to my boot-soles, by the way, is not prompted by vanity; but it's a fact that at sea one's feet and one's shoes assume the most extraordinary importance, so that we should take the precaution to have nice ones. They are all you seem to see, as the people walk about the deck; you get to know them intimately and to dislike some of them so much. I am afraid you will think that I have already broken loose; and for aught I know, I am writing as a *demoiselle bien-élevée* should not write. I don't know whether it's the American air; if it is, all I can say is that the American air is very charming. It makes me impatient and restless, and I sit scribbling here because I am so eager to arrive, and the time passes better if I occupy myself. I am in the saloon, where we have our meals, and opposite to me is a big round port-hole, wide open, to let in the smell of the land. Every now and then I rise a little and look through it, to see whether we are arriving. I mean in the Bay, you know, for we shall not come up to the city till dark. I don't want to lose the Bay; it appears that it's so wonderful. I don't exactly understand what it contains, except some beautiful islands; but I suppose you will know all about that. It is easy to see that these are the last hours, for all the people about me are writing letters to put into the post as soon as we come up to the dock. I believe they are dreadful at the custom-house, and you will remember how many new things you persuaded Mamma that (with my preoccupation of marriage) I should take to this country, where even the prettiest girls are expected not to go unadorned. We ruined ourselves in Paris (that is part of Mamma's solemnity); *mais au moins je serai belle!* Moreover, I believe that Mamma is prepared to say or to do anything that may be necessary for escaping from their odious duties; as she very justly remarks, she can't afford to be ruined twice. I don't know how one approaches these terrible *douaniers*, but I mean to invent something very charming. I mean to say, "*Voyons, Messieurs*, a young girl like me, brought up in the strictest foreign traditions, kept always in the background by a very superior mother—*la voilà*; you can see for yourself!—what is it possible that she should attempt to smuggle in? Nothing but a few simple relics of her convent!" I wont tell them that my convent was called the *Magasin du Bon Marché*. Mamma began to scold me three days ago for insisting on so many trunks, and the truth is that, between us, we have not fewer than seven. For relics, that's a good

many! We are all writing very long letters—or at least we are writing a great number. There is no news of the Bay as yet. Mr. Antrobus, Mamma's friend, opposite to me, is beginning on his ninth. He is an Honorable, and a Member of Parliament; he has written, during the voyage, about a hundred letters, and he seems greatly alarmed at the number of stamps he will have to buy when he arrives. He is full of information; but he has not enough, for he asks as many questions as Mamma when she goes to hire apartments. He is going to "look into" various things; he speaks as if they had a little hole for the purpose. He walks almost as much as I, and he has very big shoes. He asks questions even of me, and I tell him again and again that I know nothing about America. But it makes no difference; he always begins again, and indeed, it is not strange that he should find my ignorance incredible. "Now, how would it be in one of your South-western States?"—that's his favorite way of opening conversation. Fancy me giving an account of the South-western States! I tell him he had better ask Mamma—a little to tease that lady, who knows no more about such places than I. Mr. Antrobus is very big and black; he speaks with a sort of brogue; he has a wife and ten children; he is not very romantic. But he has lots of letters to people *là-bas* (I forget that we are just arriving), and Mamma, who takes an interest in him in spite of his views (which are dreadfully advanced, and not at all like Mamma's own), has promised to give him the *entrée* to the best society. I don't know what she knows about the best society over here to-day, for we have not kept up our connections at all, and no one will know (or, I am afraid, care) anything about us. She has an idea that we shall be immensely recognized; but really, except the poor little Rucks, who are bankrupt, and, I am told, in no society at all, I don't know on whom we can count. *C'est égal*. Mamma has an idea that, whether or not we appreciate America ourselves, we shall at least be universally appreciated. It's true that we have begun to be, a little; you would see that by the way that Mr. Cockerel and Mr. Louis Leverett are always inviting me to walk. Both of these gentlemen, who are Americans, have asked leave to call upon me in New York, and I have said, *Mon Dieu, oui*, if it's the custom of the country. Of course I have not dared to tell this to Mamma, who flatters herself that we have brought with us in our trunks a complete set of customs of our own, and that we shall only have to shake them out a little and put them on when we arrive. If only the two gentlemen I just spoke of don't call at

the same time, I don't think I shall be too much frightened. If they do, on the other hand, I won't answer for it. They have a particular aversion to each other, and they are ready to fight about poor little me. I am only the pretext, however; for, as Mr. Leverett says, it's really the opposition of temperaments. I hope they won't cut each other's throats, for I am not crazy about either of them. They are very well for the deck of a ship, but I shouldn't care about them in a *salon*; they are not at all distinguished. They think they are, but they are not; at least, Mr. Louis Leverett does; Mr. Cockerel doesn't appear to care so much. They are extremely different (with their opposed temperaments), and each very amusing for a while; but I should get dreadfully tired of passing my life with either. Neither has proposed that, as yet; but it is evidently what they are coming to. It will be in a great measure to spite each other, for I think that *au fond* they don't quite believe in me. If they don't, it's the only point on which they agree. They hate each other awfully; they take such different views. That is, Mr. Cockerel hates Mr. Leverett—he calls him a sickly little ass; he says that his opinions are half affectation, and the other half dyspepsia. Mr. Leverett speaks of Mr. Cockerel as a "strident savage," but he declares he finds him most diverting. He says there is nothing in which we can't find a certain entertainment, if we only look at it in the right way, and that we have no business with either hating or loving; we ought only to strive to understand. To understand is to forgive, he says. That is very pretty, but I don't like the suppression of our affections, though I have no desire to fix mine upon Mr. Leverett. He is very artistic, and talks like an article in some review. He has lived a great deal in Paris, and Mr. Cockerel says that is what has made him such an idiot. That is not complimentary to you, dear Louisa, and still less to your brilliant brother; for Mr. Cockerel explains that he means it (the bad effect of Paris) chiefly of the men. In fact, he means the bad effect of Europe altogether. This, however, is compromising to Mamma; and I am afraid there is no doubt that (from what I have told him) he thinks Mamma also an idiot. (I am not responsible, you know,—I have always wanted to go home.) If Mamma knew him, which she doesn't, for she always closes her eyes when I pass on his arm, she would think him disgusting. Mr. Leverett, however, tells me he is nothing to what we shall see yet. He is from Philadelphia (Mr. Cockerel); he insists that we shall go and see Philadelphia, but Mamma says she saw it in

1855, and it was then *affreux*. Mr. Cockerel says that Mamma is evidently not familiar with the march of improvement in this country; he speaks of 1855 as if it were a hundred years ago. Mamma says she knows it goes only too fast—it goes so fast that it has time to do nothing well; and then Mr. Cockerel, who, to do him justice, is perfectly good-natured, remarks that she had better wait till she has been ashore and seen the improvements. Mamma rejoins that she sees them from here, the improvements, and that they give her a sinking of the heart. (This little exchange of ideas is carried on through me; they have never spoken to each other.) Mr. Cockerel, as I say, is extremely good-natured, and he carries out what I have heard said about the men in America being very considerate of the women. They evidently listen to them a great deal; they don't contradict them, but it seems to me that this is rather negative. There is very little gallantry in not contradicting one; and it strikes me that there are some things the men don't express. There are others on the ship whom I've noticed. It's as if they were all one's brothers or one's cousins. But I promised you not to generalize, and perhaps there will be more expression when we arrive. Mr. Cockerel returns to America, after a general tour, with a renewed conviction that this is the only country. I left him on deck an hour ago, looking at the coast-line with an opera-glass, and saying it was the prettiest thing he had seen in all his tour. When I remarked that the coast seemed rather low, he said it would be all the easier to get ashore. Mr. Leverett doesn't seem in a hurry to get ashore; he is sitting within sight of me in a corner of the saloon—writing letters, I suppose, but looking, from the way he bites his pen and rolls his eyes about, as if he were composing a sonnet and waiting for a rhyme. Perhaps the sonnet is addressed to me; but I forget that he suppresses the affections! The only person in whom Mamma takes much interest is the great French critic, M. Lejaune, whom we have the honor to carry with us. We have read a few of his works, though Mamma disapproves of his tendencies and thinks him a dreadful materialist. We have read them for the style; you know he is one of the new Academicians. He is a Frenchman like any other, except that he is rather more quiet; and he has a gray mustache and the ribbon of the Legion of Honor. He is the first French writer of distinction who has been to America since De Tocqueville; the French, in such matters, are not very enterprising. Also, he has the air of wondering what he is

doing *dans cette galère*. He has come with his *beau-frère*, who is an engineer, and is looking after some mines, and he talks with scarcely any one else, as he speaks no English and appears to take for granted that no one speaks French. Mamma would be delighted to assure him of the contrary; she has never conversed with an Academician. She always makes a little vague inclination, with a smile, when he passes her, and he answers with a most respectful bow; but it goes no further, to Mamma's disappointment. He is always with the *beau-frère*, a rather untidy, fat, bearded man,—decorated, too, always smoking and looking at the feet of the ladies, whom Mamma (though she has very good feet) has not the courage to *aborder*. I believe M. Lejaune is going to write a book about America, and Mr. Leverett says it will be terrible. Mr. Leverett has made his acquaintance, and says M. Lejaune will put him into his book; he says the movement of the French intellect is superb. As a general thing he doesn't care for Academicians, but he thinks M. Lejaune is an exception, he is so living, so personal. I asked Mr. Cockerel what he thought of M. Lejaune's plan of writing a book, and he answered that he didn't see what it mattered to him that a Frenchman the more should make a monkey of himself. I asked him why he hadn't written a book about Europe, and he said that, in the first place, Europe isn't worth writing about, and, in the second, if he said what he thought, people would think it was a joke. He said they are very superstitious about Europe over here; he wants people in America to behave as if Europe didn't exist. I told this to Mr. Leverett, and he answered that if Europe didn't exist America wouldn't, for Europe keeps us alive by buying our corn. He said, also, that the trouble with America in the future will be that she will produce things in such enormous quantities that there won't be enough people in the rest of the world to buy them, and that we shall be left with our productions—most of them very hideous—on our hands. I asked him if he thought corn a hideous production, and he replied that there is nothing more unbeautiful than too much food. I think that to feed the world too well, however, that will be, after all, a *beau rôle*. Of course I don't understand these things, and I don't believe Mr. Leverett does; but Mr. Cockerel seems to know what he is talking about, and he says that America is complete in herself. I don't know exactly what he means, but he speaks as if human affairs had somehow moved over to this side of the world. It may be a very good place for them, and Heaven knows I am extremely tired of Europe, which Mamma

has always insisted so on my appreciating; but I don't think I like the idea of our being so completely cut off. Mr. Cockerel says it is not we that are cut off, but Europe, and he seems to think that Europe has deserved it somehow. That may be; our life over there was sometimes extremely tiresome, though Mamma says it is now that our real fatigues will begin. I like to abuse those dreadful old countries myself, but I am not sure that I am pleased when others do the same. We had some rather pretty moments there, after all; and at Piacenza we certainly lived on four francs a day. Mamma is already in a terrible state of mind about the expenses here; she is frightened by what people on the ship (the few that she has spoken to) have told her. There is one comfort, at any rate—we have spent so much money in coming here that we shall have none left to get away. I am scribbling along, as you see, to occupy me till we get news of the islands. Here comes Mr. Cockerel to bring it. Yes, they are in sight; he tells me that they are lovelier than ever, and that I must come right up right away. I suppose you will think that I am already beginning to use the language of the country. It is certain that at the end of a month I shall speak nothing else. I have picked up every dialect, wherever we have traveled; you have heard my Platt-Deutsch and my Neapolitan. But, *voyons un peu* the Bay! I have just called to Mr. Leverett to remind him of the islands. "The islands—the islands? Ah, my dear young lady, I have seen Capri, I have seen Ischia!" Well, so have I, but that doesn't prevent \* \* \* (*A little later.*) —I have seen the islands; they are rather queer.

## II.

MRS. CHURCH, IN NEW YORK, TO MADAME GALOPIN, AT GENEVA.

October 17, 1880.

If I felt far away from you in the middle of that deplorable Atlantic, *chère* Madame, how do I feel now, in the heart of this extraordinary city? We have arrived,—we have arrived, dear friend; but I don't know whether to tell you that I consider that an advantage. If we had been given our choice of coming safely to land or going down to the bottom of the sea, I should doubtless have chosen the former course; for I hold, with your noble husband, and in opposition to the general tendency of modern thought, that our lives are not our own to dispose of, but a sacred trust from a higher power, by whom we shall be held responsible. Nevertheless, if I had

foreseen more vividly some of the impressions that awaited me here, I am not sure that, for my daughter at least, I should not have preferred on the spot to hand in our account. Should I not have been less (rather than more) guilty in presuming to dispose of *her* destiny, than of my own? There is a nice point for dear M. Galopin to settle—one of those points which I have heard him discuss in the pulpit with such elevation. We are safe, however, as I say; by which I mean that we are physically safe. We have taken up the thread of our familiar *pension*-life, but under strikingly different conditions. We have found a refuge in a boarding-house which has been highly recommended to me, and where the arrangements partake of that barbarous magnificence which in this country is the only alternative from primitive rudeness. The terms, per week, are as magnificent as all the rest. The landlady wears diamond ear-rings; and the drawing-rooms are decorated with marble statues. I should indeed be sorry to let you know how I have allowed myself to be *rançonnée*; and I should be still more sorry that it should come to the ears of any of my good friends in Geneva, who know me less well than you and might judge me more harshly. There is no wine given for dinner, and I have vainly requested the person who conducts the establishment to garnish her table more liberally. She says I may have all the wine I want if I will order it at the merchant's, and settle the matter with him. But I have never, as you know, consented to regard our modest allowance of *eau rouge* as an extra; indeed, I remember that it is largely to your excellent advice that I have owed my habit of being firm on this point. There are, however, greater difficulties than the question of what we shall drink for dinner, *chère* Madame. Still, I have never lost courage, and I shall not lose courage now. At the worst, we can re-embark again, and seek repose and refreshment on the shores of your beautiful lake. (There is absolutely no scenery here!) We shall not, perhaps, in that case have achieved what we desired, but we shall at least have made an honorable retreat. What we desire—I know it is just this that puzzles you; dear friend; I don't think you ever really comprehended my motives in taking this formidable step, though you were good enough, and your magnanimous husband was good enough, to press my hand at parting in a way that seemed to say that you would still be with me, even if I was wrong. To be very brief, I wished to put an end to the reclamations of my daughter. Many Americans had assured her that she was wasting her youth in those historic lands,

which it was her privilege to see so intimately, and this unfortunate conviction had taken possession of her. "Let me at least see for myself," she used to say; "if I should dislike it over there as much as you promise me, so much the better for you. In that case we will come back and make a new arrangement at Stuttgart." The experiment is a terribly expensive one; but you know that my devotion never has shrunk from an ordeal. There is another point, moreover, which, from a mother to a mother, it would be affectation not to touch upon. I remember the just satisfaction with which you announced to me the betrothal of your charming Cécile. You know with what earnest care my Aurora has been educated,—how thoroughly she is acquainted with the principal results of modern research. We have always studied together; we have always enjoyed together. It will perhaps surprise you to hear that she makes these very advantages a reproach to me,—represents them as an injury to herself. "In this country," she says, "the gentlemen have not those accomplishments; they care nothing for the results of modern research; and it will not help a young person to be sought in marriage that she can give an account of the last German theory of Pessimism." That is possible; and I have never concealed from her that it was not for this country that I had educated her. If she marries in the United States, it is, of course, my intention that my son-in-law shall accompany us to Europe. But when she calls my attention more and more to these facts, I feel that we are moving in a different world. This is more and more the country of the many; the few find less and less place for them; and the individual—well, the individual has quite ceased to be recognized. He is recognized as a voter, but he is not recognized as a gentleman—still less as a lady. My daughter and I, of course, can only pretend to constitute a *few*! You know that I have never for a moment remitted my pretensions as an individual, though, among the agitations of *pension*-life, I have sometimes needed all my energy to uphold them. "Oh, yes, I may be poor," I have had occasion to say, "I may be unprotected, I may be reserved, I may occupy a small apartment in the *quatrième*, and be unable to scatter unscrupulous bribes among the domestics; but at least I am a *person*, with personal rights." In this country the people have rights, but the person has none. You would have perceived that if you had come with me to make arrangements at this establishment. The very fine lady who condescends to preside over it kept me waiting twenty minutes, and then came

sailing in without a word of apology. I had sat very silent, with my eyes on the clock; Aurora amused herself with a false admiration of the room,—a wonderful drawing-room, with magenta curtains, frescoed walls, and photographs of the landlady's friends—as if one cared anything about her friends! When this exalted personage came in, she simply remarked that she had just been trying on a dress—that it took so long to get a skirt to hang. “It seems to take very long, indeed!” I answered. “But I hope the skirt is right at last. You might have sent for us to come up and look at it!” She evidently didn't understand, and when I asked her to show us her rooms, she handed us over to a negro as *dégingandé* as herself. While we looked at them, I heard her sit down to the piano in the drawing-room; she began to sing an air from a comic opera. I began to fear we had gone quite astray; I didn't know in what house we could be, and was only reassured by seeing a Bible in every room. When we came down our musical hostess expressed no hope that the rooms had pleased us, and seemed quite indifferent to our taking them. She would not consent, moreover, to the least diminution, and was inflexible, as I told you, on the subject of wine. When I pushed this point, she was so good as to observe that she didn't keep a *cabaret*. One is not in the least considered; there is no respect for one's privacy, for one's preferences, for one's reserves. The familiarity is without limits, and I have already made a dozen acquaintances, of whom I know, and wish to know, nothing. Aurora tells me that she is the “belle of the boarding-house.” It appears that this is a great distinction. It brings me back to my poor child and her prospects. She takes a very critical view of them herself; she tells me that I have given her a false education, and that no one will marry her to-day. No American will marry her, because she is too much of a foreigner, and no foreigner will marry her, because she is too much of an American. I remind her that scarcely a day passes that a foreigner, usually of distinction, doesn't select an American bride, and she answers me that in these cases the young lady is not married for her fine eyes. Not always, I reply; and then she declares that she would marry no foreigner who should not be one of the first of the first. You will say, doubtless, that she should content herself with advantages that have not been deemed insufficient for Cécile; but I will not repeat to you the remark she made when I once made use of this argument. You will doubtless be surprised to hear that I have ceased to argue; but it is time I should tell

you that I have at last agreed to let her act for herself. She is to live for three months à l'*Américaine*, and I am to be a mere spectator. You will feel with me that this is a cruel position for a *cœur de mère*. I count the days till our three months are over, and I know that you will join with me in my prayers. Aurora walks the streets alone. She goes out in the tramway; a *voiture de place* costs five francs for the least little *course*. (I beseech you not to let it be known that I have sometimes had the weakness \* \* \*) My daughter is sometimes accompanied by a gentleman—by a dozen gentlemen; she remains out for hours, and her conduct excites no surprise in this establishment. I know but too well the emotions it will excite in your quiet home. If you betray us, *chère* Madame, we are lost; and why, after all, should any one know of these things in Geneva? Aurora pretends that she has been able to persuade herself that she doesn't care who knows them; but there is a strange expression in her face, which proves that her conscience is not at rest. I watch her, I let her go, but I sit with my hands clasped. There is a peculiar custom in this country—I shouldn't know how to express it in Genevese—it is called “being attentive,” and young girls are the object of the attention. It has not necessarily anything to do with projects of marriage,—though it is the privilege only of the unmarried, and though, at the same time (fortunately, and this may surprise you), it has no relation to other projects. It is simply an invention by which young persons of the two sexes pass their time together. How shall I muster courage to tell you that Aurora is now engaged in this *délassement*, in company with several gentlemen? Though it has no relation to marriage, it happily does not exclude it, and marriages have been known to take place in consequence (or in spite) of it. It is true that even in this country a young lady may marry but one husband at a time, whereas she may receive at once the attentions of several gentlemen, who are equally entitled “admirers.” My daughter, then, has admirers to an indefinite number. You will think I am joking, perhaps, when I tell you that I am unable to be exact—I who was formerly *l'exactitude même*. Two of these gentlemen are, to a certain extent, old friends, having been passengers on the steamer which carried us so far from you. One of them, still young, is typical of the American character, but a respectable person, and a lawyer in considerable practice. Every one in this country follows a profession; but it must be admitted that the professions are more highly remunerated than *chez vous*. Mr. Cockerel,

even while I write you, is in complete possession of my daughter. He called for her an hour ago in a "boghiey,"—a strange, unsafe, rickety vehicle, mounted on enormous wheels, which holds two persons very near together; and I watched her from the window take her place at his side. Then he whirled her away, behind two little horses with terribly thin legs; the whole equipage—and most of all her being in it—was in the most questionable taste. But she will return, and she will return very much as she went. It is the same when she goes down to Mr. Louis Leverett, who has no vehicle, and who merely comes and sits with her in the front *salon*. He has lived a great deal in Europe, and is very fond of the arts, and though I am not sure I agree with him in his views of the relation of art to life and life to art, and in his interpretation of some of the great works that Aurora and I have studied together, he seems to me a sufficiently serious and intelligent young man. I do not regard him as intrinsically dangerous; but, on the other hand, he offers absolutely no guarantees. I have no means whatever of ascertaining his pecuniary situation. There is a vagueness on these points which is extremely embarrassing, and it never occurs to young men to offer you a reference. In Geneva I should not be at a loss; I should come to you, *chère Madame*, with my little inquiry, and what you should not be able to tell me would not be worth knowing. But no one in New York can give me the smallest information about the *état de fortune* of Mr. Louis Leverett. It is true that he is a native of Boston, where most of his friends reside; I cannot, however, go to the expense of a journey to Boston simply to learn, perhaps, that Mr. Leverett (the young Louis) has an income of five thousand francs. As I say, however, he does not strike me as dangerous. When Aurora comes back to me, after having passed an hour with the young Louis, she says that he has described to her his emotions on visiting the home of Shelley, or discussed some of the differences between the Boston Temperament and that of the Italians of the Renaissance. You will not enter into these *rapprochements*, and I can't blame you. But you won't betray me, *chère Madame*?

## III.

FROM MISS STURDY, AT NEWPORT, TO  
MRS. DRAPER, IN FLORENCE.

September 30.

I PROMISED to tell you how I like it, but the truth is, I have gone to and fro so often that

I have ceased to like and dislike. Nothing strikes me as unexpected; I expect everything in its order. Then, too, you know, I am not a critic; I have no talent for keen analysis, as the magazines say; I don't go into the reasons of things. It is true I have been for a longer time than usual on the wrong side of the water, and I admit that I feel a little out of training for American life. They are breaking me in very fast, however. I don't mean that they bully me; I absolutely declined to be bullied. I say what I think, because I believe that I have, on the whole, the advantage of knowing what I think—when I think anything—which is half the battle. Sometimes, indeed, I think nothing at all. They don't like that over here; they like you to have impressions. That they like these impressions to be favorable appears to me perfectly natural; I don't make a crime to them of that; it seems to me, on the contrary, a very amiable quality. When individuals have it, we call them sympathetic; I don't see why we shouldn't give nations the same benefit. But there are things I haven't the least desire to have an opinion about. The privilege of indifference is the dearest one we possess, and I hold that intelligent people are known by the way they exercise it. Life is full of rubbish, and we have at least our share of it over here. When you wake up in the morning you find that during the night a cartload has been deposited in your front garden. I decline, however, to have any of it in my premises; there are thousands of things I want to know nothing about. I have outlived the necessity of being hypocritical; I have nothing to gain and everything to lose. When one is fifty years old—single, stout, and red in the face—one has outlived a good many necessities. They tell me over here that my increase of weight is extremely marked, and though they don't tell me that I am coarse, I am sure they think me so. There is very little coarseness here—not quite enough, I think—though there is plenty of vulgarity, which is a very different thing. On the whole, the country is becoming much more agreeable. It isn't that the people are charming, for that they always were (the best of them, I mean, for it isn't true of the others), but that places and things as well have acquired the art of pleasing. The houses are extremely good, and they look so extraordinarily fresh and clean. European interiors, in comparison, seem musty and gritty. We have a great deal of taste; I shouldn't wonder if we should end by inventing something pretty; we only need a little time. Of course, as yet, it's all imitation, except, by the way, these piazzas. I am

sitting on one now; I am writing to you with my portfolio on my knees. This broad, light *loggia* surrounds the house with a movement as free as the expanded wings of a bird, and the wandering airs come up from the deep sea, which murmurs on the rocks at the end of the lawn. Newport is more charming even than you remember it; like everything else over here, it has improved. It is very exquisite to-day; it is, indeed, I think, in all the world, the only exquisite watering-place, for I detest the whole genus. The crowd has left it now, which makes it all the better, though plenty of talkers remain in these large, light, luxurious houses, which are planted with a kind of Dutch definiteness all over the green carpet of the cliff. This carpet is very neatly laid and wonderfully well swept, and the sea, just at hand, is capable of prodigies of blue. Here and there a pretty woman strolls over one of the lawns, which all touch each other, you know, without hedges or fences; the light looks intense as it plays upon her brilliant dress; her large parasol shines like a silver dome. The long lines of the far shores are soft and pure, though there are places that one hasn't the least desire to visit. Altogether the effect is very delicate, and anything that is delicate counts immensely over here, for delicacy, I think, is as rare as coarseness. I am talking to you of the sea, however, without having told you a word of my voyage. It was very comfortable and amusing; I should like to take another next month. You know I am almost offensively well at sea,—that I breast the weather and brave the storm. We had no storm fortunately, and I had brought with me a supply of light literature; so I passed nine days on deck in my sea-chair, with my heels up, reading Tauchnitz novels. There was a great lot of people, but no one in particular, save some fifty American girls. You know all about the American girl, however, having been one yourself. They are, on the whole, very nice, but fifty is too many; there are always too many. There was an inquiring Briton, a radical M. P., by name Mr. Antrobus, who entertained me as much as any one else. He is an excellent man; I even asked him to come down here and spend a couple of days. He looked rather frightened, till I told him he shouldn't be alone with me, that the house was my brother's, and that I gave the invitation in his name. He came a week ago; he goes everywhere; we have heard of him in a dozen places. The English are very simple, or at least they seem so over here. Their old measurements and comparisons desert them; they don't know whether it's all a joke, or whether it's too serious by half.

We are quicker than they, though we talk so much more slowly. We think fast, and yet we talk as deliberately as if we were speaking a foreign language. They toss off their sentences with an air of easy familiarity with the tongue, and yet they misunderstand two-thirds of what people say to them. Perhaps, after all, it is only *our* thoughts they think slowly; they think their own often to a lively tune enough. Mr. Antrobus arrived here at eight o'clock in the morning; I don't know how he managed it; it appears to be his favorite hour; wherever we have heard of him he has come in with the dawn. In England, he would arrive at 5:30 P.M. He asks innumerable questions, but they are easy to answer, for he has a sweet credulity. He made me rather ashamed; he is a better American than so many of us; he takes us more seriously than we take ourselves. He seems to think that an oligarchy of wealth is growing up here, and he advised me to be on my guard against it. I don't know exactly what I can do, but I promised him to look out. He is fearfully energetic; the energy of the people here is nothing to that of the inquiring Briton. If we should devote half the energy to building up our institutions that they devote to obtaining information about them, we should have a very satisfactory country. Mr. Antrobus seemed to think very well of us, which surprised me, on the whole, because, say what one will, it's not so agreeable as England. It's very horrid that this should be; and it's delightful, when one thinks of it, that some things in England are, after all, so disagreeable. At the same time, Mr. Antrobus appeared to be a good deal pre-occupied with our dangers. I don't understand, quite, what they are; they seem to me so few, on a Newport piazza, on this bright, still day. But, after all, what one sees on a Newport piazza is not America; it's the back of Europe! I don't mean to say that I haven't noticed any dangers since my return; there are two or three that seem to me very serious, but they are not those that Mr. Antrobus means. One, for instance, is that we shall cease to speak the English language, which I prefer so much to any other. It's less and less spoken; American is crowding it out. All the children speak American, and as a child's language it's dreadfully rough. It's exclusively in use in the schools; all the magazines and newspapers are in American. Of course, a people of fifty millions, who have invented a new civilization, have a right to a language of their own; that's what they tell me, and I can't quarrel with it. But I wish they had made it as pretty as the mother-tongue, from which, after all, it is more or less derived. We ought to

have invented something as noble as our country. They tell me it's more expressive, and yet some admirable things have been said in the Queen's English. There can be no question of the Queen over here, of course, and American no doubt is the music of the future. Poor dear future, how "expressive" you'll be! For women and children, as I say, it strikes one as very rough; and moreover they don't speak it well, their own though it be. My little nephews, when I first came home, had not gone back to school, and it distressed me to see that, though they are charming children, they had the vocal inflexions of little newsboys. My niece is sixteen years old; she has the sweetest nature possible; she is extremely well-bred, and is dressed to perfection. She chatters from morning till night; but it isn't a pleasant sound! These little persons are in the opposite case from so many English girls, who know how to speak, but don't know how to talk. My niece knows how to talk, but doesn't know how to speak. *A propos* of the young people, that is our other danger; the young people are eating us up,—there is nothing in America but the young people. The country is made for the rising generation; life is arranged for them; they are the destruction of society. People talk of them, consider them, defer to them, bow down to them. They are always present, and whenever they are present there is an end to everything else. They are often very pretty; and physically, they are wonderfully looked after; they are scoured and brushed, they wear hygienic clothes, they go every week to the dentist's. But the little boys kick your shins, and the little girls offer to slap your face! There is an immense literature entirely addressed to them, in which the kicking of shins and the slapping of faces is much recommended. As a woman of fifty, I protest. I insist on being judged by my peers. It's too late, however, for several millions of little feet are actively engaged in stamping out conversation, and I don't see how they can long fail to keep it under. The future is theirs; maturity will evidently be at an increasing discount. Longfellow wrote a charming little poem, called "The Children's Hour," but he ought to have called it "The Children's Century." And by children, of course, I don't mean simple infants; I mean everything of less than twenty. The social importance of the young American increases steadily up to that age, and then it suddenly stops. The young girls, of course, are more important than the lads; but the lads are very important too. I am struck with the way they are known and talked about; they are little celebrities; they have reputations and pretensions; they are

taken very seriously. As for the young girls, as I said just now, there are too many. You will say, perhaps, that I am jealous of them, with my fifty years and my red face. I don't think so, because I don't suffer; my red face doesn't frighten people away, and I always find plenty of talkers. The young girls themselves, I believe, like me very much; and as for me, I delight in the young girls. They are often very pretty; not so pretty as people say in the magazines, but pretty enough. The magazines rather overdo that; they make a mistake. I have seen no great beauties, but the level of prettiness is high, and occasionally one sees a woman completely handsome. (As a general thing, a pretty person here means a person with a pretty face. The figure is rarely mentioned, though there are several good ones.) The level of prettiness is high, but the level of conversation is low; that's one of the signs of its being a young ladies' country. There are a good many things young ladies can't talk about; but think of all the things they can, when they are as clever as most of these. Perhaps one ought to content one's self with that measure, but it's difficult if one has lived for a while by a larger one. This one is decidedly narrow; I stretch it sometimes till it cracks. Then it is that they call me coarse, which I undoubtedly am, thank Heaven! People's talk is of course much more *châtée* over here than in Europe; I am struck with that wherever I go. There are certain things that are never said at all, certain allusions that are never made. There are no light stories, no *propos risqués*. I don't know exactly what people talk about, for the supply of scandal is small, and it's poor in quality. They don't seem, however, to lack topics. The young girls are always there; they keep the gates of conversation; very little passes that is not innocent. I find we do very well without wickedness; and, for myself, as I take my ease, I don't miss my liberties. You remember what I thought of the tone of your table in Florence, and how surprised you were when I asked you why you allowed such things. You said they were like the courses of the seasons; one couldn't prevent them; also that to change the tone of your table you would have to change so many other things. Of course, in your house one never saw a young girl; I was the only spinster, and no one was afraid of me! Of course, too, if talk is more innocent in this country, manners are so, to begin with. The liberty of the young people is the strongest proof of it. The young girls are let loose in the world, and the world gets more good of it than *ces demoiselles* get harm. In

your world—excuse me, but you know what I mean—this wouldn't do at all. Your world is a sad affair, and the young ladies would encounter all sorts of horrors. Over here, considering the way they knock about, they remain wonderfully simple, and the reason is that society protects them instead of setting them traps. There is almost no gallantry, as you understand it; the flirtations are child's play. People have no time for making love; the men, in particular, are extremely busy. I am told that sort of thing consumes hours; I have never had any time for it myself. If the leisure class should increase here considerably, there may possibly be a change; but I doubt it, for the women seem to me in all essentials exceedingly reserved. Great superficial frankness, but an extreme dread of complications. The men strike me as very good fellows. I think that at bottom they are better than the women, who are very subtle, but rather hard. They are not so nice to the men as the men are to them; I mean, of course, in proportion, you know. But women are not so nice as men, "anyhow," as they say here. The men, of course, are professional, commercial; there are very few gentlemen pure and simple. This personage needs to be very well done, however, to be of great utility; and I suppose you wont pretend that he is always well done in your countries. When he's not, the less of him the better. It's very much the same, however, with the system on which the young girls in this country are brought up. (You see, I have to come back to the young girls.) When it succeeds, they are the most charming possible; when it doesn't, the failure is disastrous. If a girl is a very nice girl, the American method brings her to great completeness,—makes all her graces flower; but if she isn't nice, it makes her exceedingly disagreeable,—elaborately and fatally perverts her. In a word, the American girl is rarely negative, and when she isn't a great success she is a great warning. In nineteen cases out of twenty, among the people who know how to live—I wont say what *their* proportion is—the results are highly satisfactory. The girls are not shy, but I don't know why they should be, for there is really nothing here to be afraid of. Manners are very gentle, very humane; the democratic system deprives people of weapons that every one doesn't equally possess. No one is formidable; no one is on stilts; no one has great pretensions or any recognized right to be arrogant. I think there is not much wickedness, and there is certainly less cruelty than with you. Every one can sit; no one is kept standing. One is much less liable to be

snubbed, which you will say is a pity. I think it is, to a certain extent; but, on the other hand, folly is less fatuous, in form, than in your countries; and as people generally have fewer revenges to take, there is less need of their being stamped on in advance. The general good nature, the social equality, deprive them of triumphs on the one hand, and of grievances on the other. There is extremely little impertinence; there is almost none. You will say I am describing a terrible society,—a society without great figures or great social prizes. You have hit it, my dear; there are no great figures. (The great prize, of course, in Europe, is the opportunity to be a great figure.) You would miss these things a good deal,—you who delight to contemplate greatness; and my advice to you, of course, is never to come back. You would miss the small people even more than the great; every one is middle-sized, and you can never have that momentary sense of tallness which is so agreeable in Europe. There are no brilliant types; the most important people seem to lack dignity. They are very *bourgeois*; they make little jokes; on occasion they make puns; they have no form; they are too good-natured. The men have no style; the women, who are fidgety and talk too much, have it only in their *coiffure*, where they have it superabundantly. But I console myself with the greater *bonhomie*. Have you ever arrived at an English country-house in the dusk of a winter's day? Have you ever made a call in London, when you knew nobody but the hostess? People here are more expressive, more demonstrative; and it is a pleasure, when one comes back (if one happens, like me, to be no one in particular), to feel one's social value rise. They attend to you more; they have you on their mind; they talk to you; they listen to you. That is, the men do; the women listen very little—not enough. They interrupt; they talk too much; one feels their presence too much as a sound. I imagine it is partly because their wits are quick, and they think of a good many things to say; not that they always say such wonders. Perfect repose, after all, is not *all* self-control; it is also partly stupidity. American women, however, make too many vague exclamations,—say too many indefinite things. In short, they have a great deal of nature. On the whole, I find very little affectation, though we shall probably have more as we improve. As yet, people haven't the assurance that carries those things off; they know too much about each other. The trouble is that over here we have all been brought up together. You will think this a picture of a dreadfully insipid society; but I hasten to

add that it's not all so tame as that. I have been speaking of the people that one meets socially; and these are the smallest part of American life. The others—those one meets on a basis of mere convenience—are much more exciting; they keep one's temper in healthy exercise. I mean the people in the shops, and on the railroads; the servants, the hackmen, the laborers, every one of whom you buy anything or have occasion to make an inquiry. With them you need all your best manners, for you must always have enough for two. If you think we are *too* democratic, taste a little of American life in these walks, and you will be reassured. This is the region of inequality, and you will find plenty of people to make your courtesy to. You see it from below—the weight of inequality is on your own back. You asked me to tell you about prices; they are simply dreadful.

## IV.

FROM THE HONORABLE EDWARD ANTROBUS,  
M. P., IN BOSTON, TO THE HONORABLE MRS.  
ANTROBUS.

October 17.

MY DEAR SUSAN: I sent you a post-card on the 13th and a native newspaper yesterday; I really have had no time to write. I sent you the newspaper partly because it contained a report—extremely incorrect—of some remarks I made at the meeting of the Association of the Teachers of New England; partly because it is so curious that I thought it would interest you and the children. I cut out some portions which I didn't think it would be well for the children to see; the parts remaining contain the most striking features. Please point out to the children the peculiar orthography, which probably will be adopted in England by the time they are grown up; the amusing oddities of expression, etc. Some of them are intentional; you will have heard of the celebrated American humor, etc. (remind me, by the way, on my return to Thistleton, to give you a few examples of it); others are unconscious, and are perhaps on that account the more diverting. Point out to the children the difference (in so far as you are sure that you yourself perceive it). You must excuse me if these lines are not very legible; I am writing them by the light of a railway-lamp, which rattles above my left ear; it being only at odd moments that I can find time to look into everything that I wish to. You will say that this is a very odd moment, indeed, when I tell you that I am in bed in a sleeping-car. I occupy the upper

berth (I will explain to you the arrangement when I return), while the lower forms the couch—the jolts are fearful—of an unknown female. You will be very anxious for my explanation; but I assure you that it is the custom of the country. I myself am assured that a lady may travel in this manner all over the Union (the Union of States) without a loss of consideration. In case of her occupying the upper berth I presume it would be different; but I must make inquiries on this point. Whether it be the fact that a mysterious being of another sex has retired to rest behind the same curtains, or whether it be the swing of the train, which rushes through the air with very much the same movement as the tail of a kite, the situation is, at any rate, so anomalous that I am unable to sleep. A ventilator is open just over my head, and a lively draught, mingled with a drizzle of cinders, pours in through this ingenious orifice. (I will describe to you its form on my return.) If I had occupied the lower berth I should have had a whole window to myself, and by drawing back the blind (a safe proceeding at the dead of night), I should have been able, by the light of an extraordinarily brilliant moon, to see a little better what I write. The question occurs to me, however,—Would the lady below me in that case have ascended to the upper berth? (You know my old taste for contingent inquiries.) I incline to think (from what I have seen) that she would simply have requested me to evacuate my own couch. (The ladies in this country ask for anything they want.) In this case I suppose I should have had an extensive view of the country, which, from what I saw of it before I turned in (while the lady beneath me was going to bed), offered a rather ragged expanse, dotted with little white wooden houses, which looked in the moonshine like pasteboard boxes. I have been unable to ascertain as precisely as I should wish by whom these modest residences are occupied; for they are too small to be the homes of country gentlemen, there is no peasantry here, and (in New England, for all the corn comes from the far West) there are no yeomen nor farmers. The information that one receives in this country is apt to be rather conflicting, but I am determined to sift the mystery to the bottom. I have already noted down a multitude of facts bearing upon the points that interest me most,—the operation of the school-boards, the co-education of the sexes, the elevation of the tone of the lower classes, the participation of the latter in political life. Political life, indeed, is almost wholly confined to the lower-middle class, and the upper section of the lower class. In some of the large towns,

indeed, the lowest order of all participates considerably,—a very interesting phase, to which I shall give more attention. It is very gratifying to see the taste for public affairs pervading so many social strata; but the indifference of the gentry is a fact not to be lightly considered. It may be objected, indeed, that there are no gentry; and it is very true that I have not yet encountered a character of the type of Lord Bottomley,—a type which I am free to confess I should be sorry to see disappear from our English system, if system it may be called, where so much is the growth of blind and incoherent forces. It is nevertheless obvious that an idle and luxurious class exists in this country, and that it is less exempt than in our own from the reproach of preferring inglorious ease to the furtherance of liberal ideas. It is rapidly increasing, and I am not sure that the indefinite growth of the dilettante spirit, in connection with large and lavishly expended wealth, is an unmixed good, even in a society in which freedom of development has obtained so many interesting triumphs. The fact that this body is not represented in the governing class, is perhaps as much the result of the jealousy with which it is viewed by the more earnest workers as of its own—I dare not, perhaps, apply a harsher term than—levity. Such, at least, is the impression I have gathered in the Middle States and in New England; in the South-west, the North-west, and the Far West, it will doubtless be liable to correction. These divisions are probably new to you; but they are the general denomination of large and flourishing communities, with which I hope to make myself at least superficially acquainted. The fatigue of traversing, as I habitually do, three or four hundred miles at a bound, is, of course, considerable; but there is usually much to inquire into by the way. The conductors of the trains, with whom I freely converse, are often men of vigorous and original minds, and even of some social eminence. One of them, a few days ago, gave me a letter of introduction to his brother-in-law, who is president of a Western university. Don't have any fear, therefore, that I am not in the best society! The arrangements for traveling are, as a general thing, extremely ingenious, as you will probably have inferred from what I told you above; but it must at the same time be conceded that some of them are more ingenious than happy. Some of the facilities, with regard to luggage, the transmission of parcels, etc., are doubtless very useful when explained, but I have not yet succeeded in mastering the intricacies. There are, on the other hand, no cabs and no porters, and I have calculated

that I have myself carried my *impedimenta*—which, you know, are somewhat numerous, and from which I cannot bear to be separated—some seventy or eighty miles. I have sometimes thought it was a great mistake not to bring Plummeridge; he would have been useful on such occasions. On the other hand, the startling question would have presented itself—Who would have carried Plummeridge's portmanteau? He would have been useful, indeed, for brushing and packing my clothes, and getting me my tub; I travel with a large tin one,—there are none to be obtained at the inns,—and the transport of this receptacle often presents the most insoluble difficulties. It is often, too, an object of considerable embarrassment in arriving at private houses, where the servants have less reserve of manner than in England; and, to tell you the truth, I am by no means certain at the present moment that the tub has been placed in the train with me. "On board" the train is the consecrated phrase here; it is an allusion to the tossing and pitching of the concatenation of cars, so similar to that of a vessel in a storm. As I was about to inquire, however, Who would get Plummeridge *his* tub, and attend to his little comforts? We could not very well make our appearance, on coming to stay with people, with *two* of the utensils I have named; though, as regards a single one, I have had the courage, as I may say, of a life-long habit. It would hardly be expected that we should both use the same; though there have been occasions in my travels as to which I see no way of blinking the fact that Plummeridge would have had to sit down to dinner with me. Such a contingency would completely have unnerved him; and, on the whole, it was doubtless the wiser part to leave him respectfully touching his hat on the tender in the Mersey. No one touches his hat over here, and though it is doubtless the sign of a more advanced social order, I confess that when I see poor Plummeridge again, this familiar little gesture—familiar, I mean, only in the sense of being often seen—will give me a measurable satisfaction. You will see from what I tell you that democracy is not a mere word in this country, and I could give you many more instances of its universal reign. This, however, is what we come here to look at, and, in so far as there seems to be proper occasion, to admire; though I am by no means sure that we can hope to establish within an appreciable time a corresponding change in the somewhat rigid fabric of English manners. I am not even prepared to affirm that such a change is desirable; you know this is one of the points on which I do not as yet see my way to

going as far as Lord B——. I have always held that there is a certain social ideal of inequality as well as of equality, and if I have found the people of this country, as a general thing, quite equal to each other, I am not sure that I am prepared to go so far as to say that, as a whole, they are equal to—excuse that dreadful blot! The movement of the train and the precarious nature of the light—it is close to my nose, and most offensive—would, I flatter myself, long since have got the better of a less resolute diarist! What I was not prepared for was the very considerable body of aristocratic feeling that lurks beneath this republican simplicity. I have on several occasions been made the confidant of these romantic but delusive vagaries, of which the stronghold appears to be the Empire City,—a slang name for New York. I was assured in many quarters that that locality, at least, is ripe for a monarchy, and if one of the Queen's sons would come and talk it over, he would meet with the highest encouragement. This information was given me in strict confidence, with closed doors, as it were; it reminded me a good deal of the dreams of the old Jacobites, when they whispered their messages to the king across the water. I doubt, however, whether these less excusable visionaries will be able to secure the services of a Pretender, for I fear that in such a case he would encounter a still more fatal Culloden. I have given a good deal of time, as I told you, to the educational system, and have visited no fewer than one hundred and forty-three schools and colleges. It is extraordinary, the number of persons who are being educated in this country; and yet, at the same time, the tone of the people is less scholarly than one might expect. A lady, a few days since, described to me her daughter as being always "on the go," which I take to be a jocular way of saying that the young lady was very fond of paying visits. Another person, the wife of a United States senator, informed me that if I should go to Washington in January, I should be quite "in the swim." I inquired the meaning of the phrase, but her explanation made it rather more than less ambiguous. To say that I am on the go describes very accurately my own situation. I went yesterday to the Pognanuc High School, to hear fifty-seven boys and girls recite in unison a most remarkable ode to the American Flag, and shortly afterward attended a ladies' lunch, at which some eighty or ninety of the sex were present. There was only one individual in trowsers—his trowsers by the way, though he brought a dozen pair, are getting rather seedy. The men in America do not partake of this meal, at which ladies assemble in large numbers to

discuss religious, political, and social topics. These immense female symposia (at which every delicacy is provided) are one of the most striking features of American life, and would seem to prove that men are not so indispensable in the scheme of creation as they sometimes suppose. I have been admitted on the footing of an Englishman—"just to show you some of our bright women," the hostess yesterday remarked. ("Bright" here has the meaning of *intellectual*.) I perceived, indeed, a great many intellectual foreheads. These curious collations are organized according to age. I have also been present as an inquiring stranger at several "girls' lunches," from which married ladies are rigidly excluded, but where the fair revelers are equally numerous and equally bright. There is a good deal I should like to tell you about my study of the educational question, but my position is somewhat cramped, and I must dismiss it briefly. My leading impression is that the children in this country are better educated than the adults. The position of a child is, on the whole, one of great distinction. There is a popular ballad of which the refrain, if I am not mistaken, is "Make me a child again, just for to-night!" and which seems to express the sentiment of regret for lost privileges. At all events they are a powerful and independent class, and have organs, of immense circulation, in the press. They are often extremely "bright." I have talked with a great many teachers, most of them lady-teachers, as they are called in this country. The phrase does not mean teachers of ladies, as you might suppose, but applies to the sex of the instructress, who often has large classes of young men under her control. I was lately introduced to a young woman of twenty-three, who occupies the chair of Moral Philosophy and Belles-Lettres in a Western college, and who told me with the utmost frankness that she was adored by the undergraduates. This young woman was the daughter of a petty trader in one of the South-western States, and had studied at Amanda College, in Missourah, an institution at which young people of the two sexes pursue their education together. She was very pretty and modest, and expressed a great desire to see something of English country-life, in consequence of which I made her promise to come down to Thistleton in the event of her crossing the Atlantic. She is not the least like Gwendolen or Charlotte, and I am not prepared to say how they would get on with her; the boys would probably do better. Still, I think her acquaintance would be of value to Miss Bumpus, and the two might pass their time very pleasantly in the

school-room. I grant you freely that those I have seen here are much less comfortable than the school-room at Thistleton. Has Charlotte, by the way, designed any more texts for the walls? I have been extremely interested in my visit to Philadelphia, where I saw several thousand little red houses with white steps, occupied by intelligent artisans, and arranged (in streets) on the rectangular system. Improved cooking-stoves, rose-wood pianos, gas and hot water, æsthetic furniture, and complete sets of the British Essayists. A tramway through every street; every block of equal length; blocks and houses scientifically lettered and numbered. There is absolutely no loss of time, and no need of looking for anything, or, indeed, *at* anything. The mind always on one's object; it is very delightful.

## V.

FROM LOUIS LEVERETT, IN BOSTON, TO  
HARVARD TREMONT, IN PARIS.

November.

THE scales have turned, my sympathetic Harvard, and the beam that has lifted you up has dropped me again on this terribly hard spot. I am extremely sorry to have missed you in London, but I received your little note, and took due heed of your injunction to let you know how I got on. I don't get on at all, my dear Harvard—I am consumed with the love of the farther shore. I have been so long away that I have dropped out of my place in this little Boston world, and the shallow tides of New England life have closed over it. I am a stranger here, and I find it hard to believe that I ever was a native. It is very hard, very cold, very vacant. I think of your warm, rich Paris; I think of the Boulevard St. Michel on the mild spring evenings. I see the little corner by the window (of the Café de la Jeunesse) where I used to sit; the doors are open, the soft, deep breath of the great city comes in. It is brilliant, yet there is a kind of tone, of body, in the brightness; the mighty murmur of the ripest civilization in the world comes in; the dear old *peuple de Paris*, the most interesting people in the world, pass by. I have a little book in my pocket; it is exquisitely printed, a modern Elzevir. It is a lyric cry from the heart of young France, and is full of the sentiment of form. There is no form here, dear Harvard; I had no idea how little form there was. I don't know what I shall do; I feel so undraped, so uncurtained, so uncushioned; I feel as if I were sitting in

the center of a mighty "reflector." A terrible crude glare is over everything; the earth looks pallid and excoriated; the raw heavens seem to bleed with the quick, hard light. I have not got back my rooms in West Cedar street; they are occupied by a mesmeric healer. I am staying at an hotel, and it is very dreadful. Nothing for one's self; nothing for one's preferences and habits. No one to receive you when you arrive; you push in through a crowd, you edge up to a counter; you write your name in a horrible book, where every one may come and stare at it and finger it. A man behind the counter stares at you in silence; his stare seems to say to you, "What the devil do *you* want?" But after this stare he never looks at you again. He tosses down a key at you; he presses a bell; a savage Irishman arrives. "Take him away," he seems to say to the Irishman; but it is all done in silence; there is no answer to your own speech,—“What is to be done with me, please?” “Wait and you will see,” the awful silence seems to say. There is a great crowd around you, but there is also a great stillness; every now and then you hear some one expectorate. There are a thousand people in this huge and hideous structure; they feed together in a big white-walled room. It is lighted by a thousand gas-jets, and heated by cast-iron screens, which vomit forth torrents of scorching air. The temperature is terrible; the atmosphere is more so; the furious light and heat seem to intensify the dreadful definiteness. When things are so ugly, they should not be so definite; and they are terribly ugly here. There is no mystery in the corners; there is no light and shade in the types. The people are haggard and joyless; they look as if they had no passions, no tastes, no senses. They sit feeding in silence, in the dry, hard light; occasionally I hear the high, firm note of a child. The servants are black and familiar; their faces shine as they shuffle about; there are blue tones in their dark masks. They have no manners; they address you, but they don't answer you; they plant themselves at your elbow (it rubs their clothes as you eat), and watch you as if your proceedings were strange. They deluge you with iced water; it's the only thing they will bring you; if you look round to summon them, they have gone for more. If you read the newspaper,—which I don't, gracious Heaven! I can't,—they hang over your shoulder and peruse it also. I always fold it up and present it to them; the newspapers here are indeed for an African taste. There are long corridors defended by gusts of hot air; down the middle swoops a pale little girl on parlor-skates. “Get out of my way!” she shrieks as she

passes; she has ribbons in her hair and frills on her dress; she makes the tour of the immense hotel. I think of Ariel, who put a girdle round the earth in forty minutes, and wonder what he said as he flitted by. A black waiter marches past me, bearing a tray, which he thrusts into my spine as he goes. It is laden with large white jugs; they tinkle as he moves, and I recognize the unconsoling fluid. We are dying of iced water, of hot air, of gas. I sit in my room thinking of these things—this room of mine which is a chamber of pain. The walls are white and bare, they shine in the rays of a horrible chandelier of imitation bronze, which depends from the middle of the ceiling. It flings a patch of shadow on a small table covered with white marble, of which the genial surface supports at the present moment the sheet of paper on which I address you; and when I go to bed (I like to read in bed, Harvard) it becomes an object of mockery and torment. It dangles at inaccessible heights; it stares me in the face; it flings the light upon the covers of my book, but not upon the page—the little French Elzevir that I love so well. I rise and put out the gas, and then my room becomes even lighter than before. Then a crude illumination from the hall, from the neighboring room, pours through the glass openings which surmount the two doors of my apartment. It covers my bed, where I toss and groan; it beats in through my closed lids; it is accompanied by the most vulgar, though the most human, sounds. I spring up to call for some help, some remedy; but there is no bell, and I feel desolate and weak. There is only a strange orifice in the wall, through which the traveler in distress may transmit his appeal. I fill it with incoherent sounds, and sounds more incoherent yet come back to me. I gather at last their meaning; they appear to constitute a somewhat stern inquiry. A hollow, impersonal voice wishes to know what I want, and the very question paralyzes me. I want everything—yet I want nothing,—nothing this hard impersonality can give! I want my little corner of Paris; I want the rich, the deep, the dark Old World; I want to be out of this horrible place. Yet I can't confide all this to that mechanical tube; it would be of no use; a mocking laugh would come up from the office. Fancy appealing in these sacred, these intimate moments, to an "office"; fancy calling out into indifferent space for a candle, for a curtain! I pay incalculable sums in this dreadful house, and yet I haven't a servant to wait upon me. I fling myself back on my couch, and for a long time afterward the orifice in the wall emits strange murmurs and

rumblings. It seems unsatisfied, indignant; it is evidently scolding me for my vagueness. My vagueness, indeed, dear Harvard! I loathe their horrible arrangements; isn't that definite enough? You asked me to tell you whom I see, and what I think of my friends. I haven't very many; I don't feel at all *en rapport*. The people are very good, very serious, very devoted to their work; but there is a terrible absence of variety of type. Every one is Mr. Jones, Mr. Brown; and every one looks like Mr. Jones and Mr. Brown. They are thin; they are diluted in the great tepid bath of Democracy! They lack completeness of identity; they are quite without modeling. No, they are not beautiful, my poor Harvard; it must be whispered that they are not beautiful. You may say that they are as beautiful as the French, as the Germans; but I can't agree with you there. The French, the Germans, have the greatest beauty of all,—the beauty of their ugliness,—the beauty of the strange, the grotesque. These people are not even ugly; they are only plain. Many of the girls are pretty; but to be only pretty is (to my sense) to be plain. Yet I have had some talk. I have seen a woman. She was on the steamer, and I afterward saw her in New York,—a peculiar type, a real personality; a great deal of modeling, a great deal of color, and yet a great deal of mystery. She was not, however, of this country; she was a compound of far-off things. But she was looking for something here—like me. We found each other, and for a moment that was enough. I have lost her now; I am sorry, because she liked to listen to me. She has passed away; I shall not see her again. She liked to listen to me; she almost understood!

## VI.

FROM M. GUSTAVE LEJAUNE, OF THE FRENCH ACADEMY, TO M. ADOLPHE BOUCHE, IN PARIS.

WASHINGTON, October 5.

I GIVE you my little notes; you must make allowances for haste, for bad inns, for the perpetual scramble, for ill-humor. Everywhere the same impression,—the platitude of unbalanced democracy intensified by the platitude of the spirit of commerce. Everything on an immense scale—everything illustrated by millions of examples. My brother-in-law is always busy; he has appointments, inspections, interviews, disputes. The people, it appears, are incredibly sharp in conversation, in argument; they wait for you in silence at the corner of the road, and then they suddenly

discharge their revolver. If you fall, they empty your pockets; the only chance is to shoot them first. With that, no amenities, no preliminaries, no manners, no care for the appearance. I wander about while my brother is occupied; I lounge along the streets; I stop at the corners; I look into the shops; *je regarde passer les femmes*. It's an easy country to see; one sees everything there is; the civilization is skin-deep; you don't have to dig. This positive, practical, pushing *bourgeoisie* is always about its business; it lives in the street, in the hotel, in the train; one is always in a crowd—there are seventy-five people in the tramway. They sit in your lap; they stand on your toes; when they wish to pass, they simply push you. Everything in silence; they know that silence is golden, and they have the worship of gold. When the conductor wishes your fare, he gives you a poke, very serious, without a word. As for the types—but there is only one—they are all variations of the same—the *commis-voyageur* minus the gayety. The women are often pretty; you meet the young ones in the streets, in the trains, in search of a husband. They look at you frankly, coldly, judicially, to see if you will serve; but they don't want what you might think (*du moins on me l'assure*); they only want the husband. A Frenchman may mistake; he needs to be sure he is right, and I always make sure. They begin at fifteen; the mother sends them out; it lasts all day (with an interval for dinner at a pastry-cook's); sometimes it goes on for ten years. If they haven't found the husband then, they give it up; they make place for the *cadettes*, as the number of women is enormous. No *salons*, no society, no conversation; people don't receive at home; the young girls have to look for the husband where they can. It is no disgrace not to find him—several have never done so. They continue to go about unmarried—from the force of habit, from the love of movement, without hopes, without regrets—no imagination, no sensibility, no desire for the convent. We have made several journeys,—few of less than three hundred miles. Enormous trains, enormous *wagons*, with beds and lavatories, and negroes who brush you with a big broom, as if they were grooming a horse. A bounding movement, a roaring noise, a crowd of people who look very tired, a boy who passes up and down throwing pamphlets and sweetmeats into your lap—that is an American journey. There are windows in the *wagons*—enormous, like everything else; but there is nothing to see. The country is a void—no features, no objects, no details, nothing to show you that you are in one place more

than another. *Aussi*, you are not in one place; you are everywhere, anywhere; the train goes a hundred miles an hour. The cities are all the same; little houses ten feet high, or else big ones two hundred; tramways, telegraph-poles, enormous signs, holes in the pavement, oceans of mud, *commis-voyageurs*, young ladies looking for the husband. On the other hand, no beggars and no *cocottes*—none, at least, that you see. A colossal mediocrity, except (my brother-in-law tells me) in the machinery, which is magnificent. Naturally, no architecture (they make houses of wood and of iron), no art, no literature, no theater. I have opened some of the books; *mais ils ne se laissent pas lire*. No form, no matter, no style, no general ideas; they seem to be written for children and young ladies. The most successful (those that they praise most) are the facetious; they sell in thousands of editions. I have looked into some of the most *vantés*; but you need to be forewarned, to know that they are amusing; *des plaisanteries de croquemort*. They have a novelist with pretensions to literature, who writes about the chase for the husband and the adventures of the rich Americans in our corrupt old Europe, where their primeval candor puts the Europeans to shame. *C'est proprement écrit*; but it's very pale. What isn't pale is the newspapers—enormous, like everything else (fifty columns of advertisements), and full of the *commérages* of a continent. And such a tone, *grand Dieu*! The amenities, the personalities, the recriminations, are like so many *coups de revolver*. Headings six inches tall; correspondences from places one never heard of; telegrams from Europe about Sarah Bernhardt; little paragraphs about nothing at all; the *menu* of the neighbor's dinner; articles on the European situation *à pouffer de rire*; all the *tripotage* of local politics. The *reportage* is incredible; I am chased up and down by the interviewers. The matrimonial infelicities of M. and Madame X. (they give the name), *tout au long*, with every detail—not in six lines, discreetly veiled, with an art of insinuation, as with us; but with all the facts (or the fictions), the letters, the dates, the places, the hours. I open a paper at hazard, and I find *au beau milieu, à propos* of nothing, the announcement—"Miss Susan Green has the longest nose in Western New York." Miss Susan Green (*je me renseigne*) is a celebrated authoress; and the Americans have the reputation of spoiling their women. They spoil them *à coups de poing*. We have seen few interiors (no one speaks French); but if the newspapers give an idea of the domestic *mœurs*, the *mœurs* must be curious.

The passport is abolished, but they have printed my *signalement* in these sheets,—perhaps for the young ladies who look for the husband. We went one night to the theater; the piece was French (they are the only ones), but the acting was American—too American; we came out in the middle. The want of taste is incredible. An Englishman whom I met tells me that even the language corrupts itself from day to day; an Englishman ceases to understand. It encourages me to find that I am not the only one. There are things every day that one can't describe. Such is Washington, where we arrived this morning, coming from Philadelphia. My brother-in-law wishes to see the Bureau of Patents, and on our arrival he went to look at his machines, while I walked about the streets and visited the Capitol! The human machine is what interests me most. I don't even care for the political—for that's what they call their government here—"the machine." It operates very roughly, and some day, evidently, it will explode. It is true that you would never suspect that they have a government; this is the principal seat, but, save for three or four big buildings, most of them *affreux*, it looks like a settlement of negroes. No movement, no officials, no authority, no embodiment of the State. Enormous streets, *comme toujours*, lined with little red houses where nothing ever passes but the tramway. The Capitol—a vast structure, false classic, white marble, iron and stucco, which has *assez grand air*—must be seen to be appreciated. The goddess of liberty on the top, dressed in a bear's skin; their liberty over here is the liberty of bears. You go into the Capitol as you would into a railway station; you walk about as you would in the Palais Royal. No functionaries, no doorkeepers, no officers, no uniforms, no badges, no restrictions, no authority—nothing but a crowd of shabby people circulating in a labyrinth of spittoons. We are too much governed perhaps in France; but at least we have a certain incarnation of the national conscience, of the national dignity. The dignity is absent here, and I am told that the conscience is an abyss. "*L'état c'est moi*" even—I like that better than the spittoons. These implements are architectural, monumental; they are the only monuments. *En somme*, the country is interesting, now that we too have the Republic; it is the biggest illustration, the biggest warning. It is the last word of democracy, and that word is—flatness. It is very big, very rich, and perfectly ugly. A Frenchman couldn't live here; for life with us, after all, at the worst is a sort of appreciation. Here, there is nothing

to appreciate. As for the people, they are the English *minus* the conventions. You can fancy what remains. The women, *pour-tant*, are sometimes rather well turned. There was one at Philadelphia—I made her acquaintance by accident—whom it is probable I shall see again. She is not looking for the husband; she has already got one. It was at the hotel; I think the husband doesn't matter. A Frenchman, as I have said, may mistake, and he needs to be sure he is right. *Aussi*, I always make sure!

## VII.

FROM MARCELLUS COCKEREL, IN WASHINGTON, TO MRS. COOLER, NÉE COCKEREL, AT OAKLAND, CALIFORNIA.

October 25.

I OUGHT to have written to you long before this, for I have had your last excellent letter for four months in my hands. The first half of that time I was still in Europe; the last I have spent on my native soil. I think, therefore, my silence is owing to the fact that over there I was too miserable to write, and that here I have been too happy. I got back the 1st of September—you will have seen it in the papers. Delightful country, where one sees everything in the papers—the big, familiar, vulgar, good-natured, delightful papers, none of which has any reputation to keep up for anything but getting the news! I really think that has had as much to do as anything else with my satisfaction at getting home—the difference in what they call the "tone of the press." In Europe it's too dreary—the sapience, the solemnity, the false respectability, the verbosity, the long disquisitions on superannuated subjects. Here the newspapers are like the railroad trains, which carry everything that comes to the station, and have only the religion of punctuality. As a woman, however, you probably detest them; you think they are (the great word) vulgar. I admitted it just now, and I am very happy to have an early opportunity to announce to you that that idea has quite ceased to have any terrors for me. There are some conceptions to which the female mind can never rise. Vulgarity is a stupid, superficial, question-begging accusation, which has become to-day the easiest refuge of mediocrity. Better than anything else, it saves people the trouble of thinking, and anything which does that succeeds. You must know that in these last three years in Europe I have become terribly vulgar myself; that's one service my travels

have rendered me. By three years in Europe I mean three years in foreign parts altogether, for I spent several months of that time in Japan, India, and the rest of the East. Do you remember when you bade me good-bye in San Francisco, the night before I embarked for Yokohama? You foretold that I should take such a fancy to foreign life that America would never see me more, and that if *you* should wish to see me (an event you were good enough to regard as possible), you would have to make a rendezvous in Paris or in Rome. I think we made one (which you never kept), but I shall never make another for those cities. It was in Paris, however, that I got your letter; I remember the moment as well as if it were (to my honor) much more recent. You must know that, among many places I dislike, Paris carries the palm. I am bored to death there; it's the home of every humbug. The life is full of that false comfort which is worse than discomfort, and the small, fat, irritable people give me the shivers. I had been making these reflections even more devoutly than usual one very tiresome evening toward the beginning of last summer, when, as I reëntered my hotel at ten o'clock, the little reptile of a portress handed me your gracious lines. I was in a villainous humor. I had been having an over-dressed dinner in a stuffy restaurant, and had gone from there to a suffocating theater, where, by way of amusement, I saw a play in which blood and lies were the least of the horrors. The theaters over there are insupportable; the atmosphere is pestilential. People sit with their elbows in your sides; they squeeze past you every half-hour. It was one of my bad moments; I have a great many in Europe. The conventional, perfunctory play, all in falsetto, which I seemed to have seen a thousand times; the horrible faces of the people; the pushing, bullying *ouvreuse*, with her false politeness and her real rapacity, drove me out of the place at the end of an hour; and, as it was too early to go home, I sat down before a *café* on the Boulevard, where they served me a glass of sour, watery beer. There on the Boulevard, in the summer night, life itself was even uglier than the play, and it wouldn't do for me to tell you what I saw. Besides, I was sick of the Boulevard, with its eternal grimace and the deadly sameness of the *article de Paris*, which pretends to be so various—the shop-windows a wilderness of rubbish and the passers-by a procession of manikins. Suddenly it came over me that I was supposed to be amusing myself—my face was a yard long—and that you probably at that moment were saying to your husband: "He stays

away so long! What a good time he must be having!" The idea was the first thing that had made me smile for a month; I got up and walked home, reflecting, as I went, that I was "seeing Europe," and that, after all, one *must* see Europe. It was because I had been convinced of this that I came out, and it is because the operation has been brought to a close that I have been so happy for the last eight weeks. I was very conscientious about it, and, though your letter that night made me abominably homesick, I held out to the end, knowing it to be once for all. I shan't trouble Europe again; I shall see America for the rest of my days. My long delay has had the advantage that now, at least, I can give you my impressions—I don't mean of Europe; impressions of Europe are easy to get—but of this country, as it strikes the re-instated exile. Very likely you'll think them queer; but keep my letter, and twenty years hence they will be quite commonplace. They won't even be vulgar. It was very deliberate, my going round the world. I knew that one ought to see for one's self, and that I should have eternity, so to speak, to rest. I traveled energetically; I went everywhere and saw everything; took as many letters as possible, and made as many acquaintances. In short, I held my nose to the grindstone. The upshot of it all is that I have got rid of a superstition. We have so many, that one the less—perhaps the biggest of all—makes a real difference in one's comfort. The superstition in question—of course you have it—is that there is no salvation but through Europe. Our salvation is here, if we have eyes to see it, and the salvation of Europe into the bargain; that is, if Europe is to be saved, which I rather doubt. Of course, you'll call me a bird o' freedom, a braggart, a waver of the stars and stripes; but I'm in the delighted position of not minding in the least what any one calls me. I haven't a mission; I don't want to preach; I have simply arrived at a state of mind; I have got Europe off my back. You have no idea how it simplifies things, and how jolly it makes me feel. Now I can live; now I can talk. If we wretched Americans could only say once for all, "Oh, Europe be hanged!" we should attend much better to our proper business. We have simply to live our life, and the rest will look after itself. You will probably inquire what it is that I like better over here, and I will answer that it's simply—life. Disagreeables for disagreeables, I prefer our own. The way I have been bored and bullied in foreign parts, and the way I have had to say I found it pleasant! For a good while this appeared to be a sort of congenital ob-

ligation, but one fine day it occurred to me that there was no obligation at all, and that it would ease me immensely to admit to myself that (for me, at least) all those things had no importance. I mean the things they rub into you in Europe; the tiresome international topics, the petty politics, the stupid, social customs, the baby-house scenery. The vastness and freshness of this American world, the great scale and great pace of our development, the good sense and good nature of the people, console me for there being no cathedrals and no Titians. I hear nothing about Prince Bismarck and Gambetta, about the Emperor William and the Czar of Russia, about Lord Beaconsfield and the Prince of Wales. I used to get so tired of their Mumbo-Jumbo of a Bismarck, of his secrets and surprises, his mysterious intentions and oracular words. They revile us for our party politics; but what are all the European jealousies and rivalries, their armaments and their wars, their rapacities and their mutual lies, but the intensity of the spirit of party? what question, what interest, what idea, what need of mankind, is involved in any of these things? Their big, pompous armies, drawn up in great silly rows, their gold lace, their salaams, their hierarchies, seem a pastime for children; there's a sense of humor and of reality over here that laughs at all that. Yes, we are nearer the reality—we are nearer what they will all have to come to. The questions of the future are social questions, which the Bismarcks and Beaconsfields are very much afraid to see settled; and the sight of a row of supercilious potentates holding their peoples like their personal property, and bristling all over, to make a mutual impression, with feathers and sabers, strikes us as a mixture of the grotesque and the abominable. What do we care for the mutual impressions of potentates who amuse themselves with sitting on people? Those things are their own affair, and they ought to be shut up in a dark room to have it out together. Once one feels, over here, that the great questions of the future are social questions, that a mighty tide is sweeping the world to democracy, and that this country is the biggest stage on which the drama can be enacted, the fashionable European topics seem petty and parochial. They talk about things that we have settled ages ago, and the solemnity with which they propound to you their little domestic embarrassments make a heavy draft on one's good nature. In England they were talking about the Hares and Rabbits Bill, about the extension of the County Franchise, about the Dissenters' Burials, about the Deceased Wife's Sister, about the abolition of the House of

Lords, about heaven knows what ridiculous little measure for the propping-up of their ridiculous little country. And they call *us* provincial! It is hard to sit and look respectable while people discuss the utility of the House of Lords and the beauty of a State Church, and it's only in a dowdy, musty civilization that you'll find them doing such things. The lightness and clearness of the social air, that's the great relief in these parts. The gentility of bishops, the propriety of parsons, even the impressiveness of a restored cathedral, give less of a charm to life than that. I used to be furious with the bishops and parsons, with the humbuggery of the whole affair, which every one was conscious of, but which people agreed not to expose, because they would be compromised all round. The convenience of life over here, the quick and simple arrangements, the absence of the spirit of routine, are a blessed change from the stupid stiffness with which I struggled for two long years. There were people with swords and cockades who used to order me about; for the simplest operation of life I had to kootoo to some bloated official. When it was a question of my doing a little differently from others, the bloated official gasped as if I had given him a blow on the stomach; he needed to take a week to think of it. On the other hand, it's impossible to take an American by surprise; he is ashamed to confess that he has not the wit to do a thing that another man has had the wit to think of. Besides, being as good as his neighbor, he must therefore be as clever,—which is an affliction only to people who are afraid he may be cleverer. If this general efficiency and spontaneity of the people—the union of the sense of freedom with the love of knowledge—isn't the very essence of a high civilization, I don't know what a high civilization is. I felt this greater ease on my first railroad journey,—felt the blessing of sitting in a train where I could move about, where I could stretch my legs and come and go, where I had a seat and a window to myself, where there were chairs and tables and food and drink. The villainous little boxes on the European trains, in which you are stuck down in a corner, with doubled-up knees, opposite to a row of people—often most offensive types—who stare at you for ten hours on end—these were part of my two years' ordeal. The large, free way of doing things here is everywhere a pleasure. In London, at my hotel, they used to come to me on Saturday to make me order my Sunday's dinner, and when I asked for a sheet of paper, they put it into the bill. The meagerness, the stinginess, the perpetual expecta-

tion of a sixpence, used to exasperate me. Of course, I saw a great many people who were pleasant; but as I am writing to you, and not to one of them, I may say that they were dreadfully apt to be dull. The imagination among the people I see here is more flexible; and then they have the advantage of a larger horizon. It's not bounded on the north by the British aristocracy, and on the south by the *scrutin de liste*. (I mix up the countries a little, but they are not worth the keeping apart.) The absence of little conventional measurements, of little cut-and-dried judgments, is an immense refreshment. We are more analytic, more discriminating, more familiar with realities. As for manners, there are bad manners everywhere, but an aristocracy is bad manners organized. (I don't mean that they may not be polite among themselves, but they are rude to every one else.) The sight of all these growing millions simply minding their business, is impressive to me,—more so than all the gilt buttons and padded chests of the Old World; and there is a certain powerful type of "practical" American (you'll find him chiefly in the West), who doesn't brag as I do (I'm not practical), but who quietly feels that he has the Future in his vitals,—a type that strikes me more than any I met in your favorite countries. Of course you'll come back to the cathedrals and Titians, but there's a thought that helps one to do without them,—the thought that though there's an immense deal of plainness, there's little misery, little squalor, little degradation. There is no regular wife-beating class, and there are none of the stultified peasants of whom it takes so many to make a European noble. The people here are more conscious of things; they invent, they act, they answer for themselves, they are not (I speak of social matters) tied up by authority and precedent. We shall have all the Titians by-and-by, and we shall move over a few cathedrals. You had better stay here if you want to have the best. Of course, I am a roaring Yankee; but you'll call me that if I say the least, so I may as well take my ease and say the most. Washington's a most entertaining place; and here at least, at the seat of government, one isn't overgoverned. In fact, there's no government at all to speak of; it seems too good to be true. The first day I was here I went to the Capitol, and it took me ever so long to figure to myself that I had as good a right there as any one else,—that the whole magnificent pile (it is magnificent by the way) was in fact my own. In Europe one doesn't rise to such conceptions, and my spirit had been broken in Europe. The doors were gaping wide—

I walked all about; there were no door-keepers, no officers, nor flunkeys,—not even a policeman to be seen. It seemed strange not to see a uniform, if only as a patch of color. But this isn't government by livery. The absence of these things is odd at first; you seem to miss something, to fancy the machine has stopped. It hasn't, though; it only works without fire and smoke. At the end of three days, this simple negative impression—the fact is that there are no soldiers nor spies, nothing but plain black coats—begins to affect the imagination, becomes vivid, majestic, symbolic. It ends by being more impressive than the biggest review I saw in Germany. Of course, I'm a roaring Yankee; but one has to take a big brush to copy a big model. The future is here, of course; but it isn't only that—the present is here as well. You will complain that I don't give you any personal news; but I am more modest for myself than for my country. I spent a month in New York, and while I was there I saw a good deal of a rather interesting girl who came over with me in the steamer, and whom for a day or two I thought I should like to marry. But I shouldn't. She has been spoiled by Europe!

## VIII.

FROM MISS AURORA CHURCH, IN NEW YORK,  
TO MISS WHITESIDE, IN PARIS.

January 9.

I TOLD you (after we landed) about my agreement with Mamma—that I was to have my liberty for three months, and if at the end of this time I shouldn't have made a good use of it, I was to give it back to her. Well, the time is up to-day, and I am very much afraid I haven't made a good use of it. In fact, I haven't made any use of it at all—I haven't got married, for that is what Mamma meant by our little bargain. She has been trying to marry me in Europe, for years, without a *dot*, and as she has never (to the best of my knowledge) even come near it, she thought at last that, if she were to leave it to me, I might do better. I couldn't certainly do worse. Well, my dear, I have done very badly—that is, I haven't done at all. I haven't even tried. I had an idea that this affair came of itself over here; but it hasn't come to me. I won't say I am disappointed, for I haven't, on the whole, seen any one I should like to marry. When you marry people over here, they expect you to love them, and I haven't seen any

one I should like to love. I don't know what the reason is, but they are none of them what I have thought of. It may be that I have thought of the impossible; and yet I have seen people in Europe whom I should have liked to marry. It is true, they were almost always married to some one else. What I *am* disappointed in is simply having to give back my liberty. I don't wish particularly to be married; and I do wish to do as I like—as I have been doing for the last month. All the same, I am sorry for poor Mamma, as nothing has happened that she wished to happen. To begin with, we are not appreciated, not even by the Rucks, who have disappeared, in the strange way in which people over here seem to vanish from the world. We have made no sensation; my new dresses count for nothing (they all have better ones); our philological and historical studies don't show. We have been told we might do better in Boston; but, on the other hand, Mamma hears that in Boston the people only marry their cousins. Then Mamma is out of sorts because the country is exceedingly dear and we have spent all our money. Moreover, I have neither eloped, nor been insulted, nor been talked about, nor—so far as I know—deteriorated in manners or character; so that Mamma is wrong in all her previsions. I think she would have rather liked me to be insulted. But I have been insulted as little as I have been adored. They don't adore you over here; they only make you think they are going to. Do you remember the two gentlemen who were on the ship, and who, after we arrived here, came to see me *à tour de rôle*? At first I never dreamed they were making love to me, though Mamma was sure it must be that; then, as it went on a good while, I thought perhaps it *was* that; and I ended by seeing that it wasn't anything! It was simply conversation; they are very fond of conversation over here. Mr. Leverett and Mr. Cockerel disappeared one fine day, without the smallest pretension to having

broken my heart, I am sure, though, it only depended on me to think they had! All the gentlemen are like that; you can't tell what they mean; everything is very confused; society appears to consist of a sort of innocent jilting. I think, on the whole, I *am* a little disappointed—I don't mean about one's not marrying; I mean about the life generally. It seems so different at first, that you expect it will be very exciting; and then you find that, after all, when you have walked out for a week or two by yourself and driven out with a gentleman in a buggy, that's about all there is of it, as they say here. Mamma is very angry at not finding more to dislike; she admitted yesterday that, once one has got a little settled, the country has not even the merit of being hateful. This has evidently something to do with her suddenly proposing three days ago that we should go to the West. Imagine my surprise at such an idea coming from Mamma! The people in the *pension*—who, as usual, wish immensely to get rid of her—have talked to her about the West, and she has taken it up with a kind of desperation. You see, we must do something; we can't simply remain here. We are rapidly being ruined, and we are not—so to speak—getting married. Perhaps it will be easier in the West; at any rate, it will be cheaper, and the country will have the advantage of being more hateful. It is a question between that and returning to Europe, and for the moment Mamma is balancing. I say nothing: I am really indifferent; perhaps I shall marry a pioneer. I am just thinking how I shall give back my liberty. It really won't be possible; I haven't got it any more; I have given it away to others. Mamma may recover it, if she can, from *them*! She comes in at this moment to say that we must push farther—she has decided for the West. Wonderful Mamma! It appears that my real chance is for a pioneer—they have sometimes millions. But, fancy us in the West!

Henry James, Jr.

## THE PROBLEM OF SPELLING REFORM.

IN the year 1867, Professor W. D. Whitney contributed to the New York "Nation" a series of articles on the subject of English spelling. At the outset he took the pains to describe the feeling then existing in regard to the desirability of reform, and there is no question that he described it accurately. According to his statement public sentiment was more unanimous and more bitter in its hostility to any change in orthography than it had been for a long period before. Movements which had once made some headway had either been abandoned or were on the point of being abandoned. The favorers of even the slightest reform were not only insignificant as regards numbers, they were even more insignificant as regards influence. If any feeling existed besides that of unquestioning acquiescence in what had come to be established, it was of a reactionary nature, for there was a growing disposition in this country to re-introduce any absurdity still found in the spelling used in Great Britain, which, by accident or design, or a lucky attack of common sense, had dropped out of the spelling used in America. The outlook was certainly gloomy enough to every one who felt that the present condition of English orthography was not merely a barrier to the spread of our tongue, but both a disgrace and an intellectual injury to the men who speak it.

Little more than fifteen years have gone by, and the change which has already taken place is remarkable. Whatever else it shows, it proves that there is no insuperable obstacle to the success of the movement, if its advocates are not only willing to labor, but are also willing to wait. It has already attained to a certain degree of popular favor. It is no longer ridiculed; it begins to be feared. The minds of most men, moreover, are now in a state in regard to it such as they have never been in before,—in a state in which they are prepared to examine fairly and dispassionately the arguments for or against change. This is certainly a great advance. There are some, accordingly, who think that public sentiment is already nearly ripe for a wide-reaching and radical reform. Anxious as I should be to find myself a false prophet, I see no such clear evidence of the speedy triumph of reason over prejudice and prescription. As most of the hostility to any change has been and still is due to pure ignorance of the condition in which our orthography is, so it is to be feared

that some of the favor with which a reform of it is regarded is also due to ignorance of what reform really means. In fact, from the very beginning, there have been in the present movement two parties holding widely different views. They may unite against a common foe; but a triumph there would be certain to be followed by a division among the conquerors. In this respect spelling reform is no different from any other reform. But while it is nothing to its discredit that this should be the case, it may be very much to its disadvantage if the fact is not recognized from the outset.

Moreover, it ought to be premised, that as no reform ever yet proved an unmixed blessing, neither will a reform of the spelling prove such, if actually accomplished. Especially will this be true of it at its introduction. A change on any wide scale in English orthography will involve for the time being grave disadvantages. Do the best we can, there must be a period of chaos. The conflict between the old that is going out and the new which is coming in, can not fail to produce more or less of confusion. Such a state of things has about it, on a small scale, much that is annoying, and, perhaps, some things even harmful. One peculiar difficulty, invariably attendant upon changes in the established spelling, deserves especial mention. This is the fact that any alteration of the usual form of a word, no matter how slight, is sure at first to attract the attention to the symbol, and distract it from the meaning which the symbol was intended to convey. These disadvantages and these disturbances last, indeed, only for a time; but they are very real while they do last. Those of us who believe that the permanent benefits accruing to the users of our tongue from a radical reform outweigh immensely the temporary inconveniences and annoyances to which they will be subject, can well afford to bear with the hesitation of those who like the end in view, but dislike the toil and trouble that must be gone through to reach it. The reasons of such for a reluctance to unsettle the existing condition of things are widely different from the pretentious objections urged against change by men who show by every word they utter, that it is a subject about which they have no knowledge and upon which they have spent no thought. The existence of a class of persons who look upon the present state of our

orthography as an evil, but an evil that can not be got rid of without costing more than the benefit received in return, must always be taken into consideration. When we add to them the large number of those who are opposed to change here, because they are opposed to change everywhere, we get some glimpse of the labor that will have to be done before the public mind has been educated up to the point of desiring to have a theoretical reform put into actual practice.

It would, therefore, be no hard task to show that a long time must elapse before any new system of orthography, however perfect, could hope for general adoption. For the purposes of this discussion, however, let it be assumed that this point has been reached; that a reform of some kind is generally looked upon not only as desirable, but as practicable. At once arises the question what shall be its nature? How far shall it be carried? On this very subject, as it has been intimated, there exist two parties; indeed, they have existed from a period long before the present movement was contemplated. They may be characterized by a slight difference in wording. One of them favors reform *in* English orthography, the other favors reform *of* English orthography. In one sense the second party would be included in the first, just as in the contest which led to the American civil war, those who sought the abolition of slavery could be reckoned among those who were opposed to its extension. Still the differences between the two are marked, and from certain points of view are fundamental. As to the one or other of these have belonged all those concerned in previous efforts for reform, and now do belong all those interested in the present effort, an exact account of the position each party occupies will show the different forces at work in this field, and the relation they bear to one another.

Reform *in* English orthography does not imply any sweeping change whatever. The spelling is to be left essentially what it is now. A number of simplifications only are to be adopted. One of the most important of these would naturally be the dropping of useless letters, particularly in those cases where the useless letter is misleading as to the derivation, as, for instance, the *h* in *rhyme*, the *c* in *scent*, and the *g* in *foreign* and *sovereign*. Another would be the reduction to uniformity of ending of words belonging to the same class. An illustration of this, familiar to all, would be the rejection of one of the two terminations *our* and *or*. A more marked change still would be a modification of spelling where the pronunciation required it.

Thus, the passive participle in *ed* would be written with *t*, when it was so sounded, as *mixt* and *fixt* for *mixed* and *fixed*. This already prevails to a certain degree; and the effort made here would simply be to extend a principle, which is now applied to some words, to every one of the class to which they belong.

All the changes which the advocates of reform *in* English orthography propose are of this nature. It is evident at a glance that alterations such as these are far from revolutionary. So little, indeed, are they of that character, that, if carried out completely, they would not materially affect the external appearance of the spelling. This is both the claim and the boast of those who seek for improvement in our orthography, but no thorough reconstruction of it. They pride themselves upon the fact that the changes which they wish to bring about are not radical and sweeping. They are in favor of what they call a judicious reform,—reform which, because it is judicious, is therefore practicable. Certainly it might seem at first view that a movement of this kind would need only to attract the attention of men in order to succeed. A believer in sweeping changes might find fault with it for falling far short of what it claimed to do; but what serious objection could be made by an advocate of the existing system against alterations, slight in themselves, and having no other effect, scarcely, than that of producing uniformity where there is now only arbitrary diversity? It would surely seem hard for a being, who believes that he has intellect enough to be lost or saved, to pretend that he sees any reason why the plural of words ending in *o* should in some cases be spelled with simple *s*, in other cases with *es*. Yet, as a matter of fact, against such changes as these the bitterest hostility has been shown in the past. Who is ignorant of the strife in regard to words ending in *or* or *our*, and the absurd arguments brought forward to sustain incorrect statements? Or take as even a more signal illustration the controversy about the terminations *er* or *re*, in which the assertion was often made by some, and believed by most, that in words like *theater*, *meter*, and *center* the spelling, with the ending *er* instead of *re*, was an unauthorized innovation of Webster's. The truth is, if my own special reading represents fairly the general practice, that in the sixteenth and the first half of the seventeenth century, while both ways of writing these words existed side by side, the termination *er* is far more common than that in *re*. Let any one consult the original editions of Spenser, Ben Jonson, and Shak-

sphere, for the spelling of *theater*, at a time when the theater was in its highest glory, and it is safe to say that where the word is found ending in *re* once, it will be found three times, at the very least, ending in *er*. Particular facts may perhaps carry more weight than general assertions. The first complete edition of Shakspeare's plays was published in 1623. In that work *sepulcher* occurs thirteen times; it is spelled eleven times with *er*. *Scepter* occurs thirty-seven times; it is not once spelled with *re*, but always with *er*. *Center* occurs twelve times, and in nine instances out of the twelve it ends in *er*. It is needless to multiply further examples.

All these attempts, however, at so-called judicious reform have met, as has been said, with neglect as marked or with attacks as bitter as could have followed the most revolutionary suggestions. In part this result was a deserved one. A piecemeal restoration of anything, by one who does not intend to restore the whole in conformity, will always leave not only much to be desired, but introduce a great deal to be deprecated; and of this last the opponents of even the slightest change will be sure to make the most. It may be added, indeed, that much of the discredit which has attached to movements in favor of spelling reform in the past has been in many instances due to the imperfect knowledge of those who have been concerned in them. They saw that there was an evil, but they did not see what the evil was. They did not propose their half-way measures as preparations for something better; they looked upon them as final in themselves. It will be instructive to glance at some of these efforts, designed merely to improve, but not to reconstruct. It need hardly be said that reform of this partial kind could never be pressed conscientiously as reform, until after uniformity of spelling had been established; and, consequently, changes in orthography as distinguished from change of orthography do not go back to an early period, at least on any extensive scale. Nearly all of them took place in the latter half of the eighteenth century or the first half of the nineteenth, more especially in the former. Johnson's method of spelling was then felt, more than it was later, as a tyranny; for it was so new that all had not become used to it, and none had learned to love it, at least with the gushing affection of our time. Many there were who still remembered the former state of comparative freedom; a few who sought to set up rival thrones of their own. The crotchets, moreover, in which individual writers have indulged, have been numberless; but, as in the vast majority of cases the changes proposed by them have

been based upon no scientific principles, still less have been the product of any thoroughly worked-out theory; they have served little other purpose than to arrest momentarily the attention of the curious, and have had absolutely no influence whatever upon the orthography generally received. It is not necessary to remind readers familiar with the writings of the historian Mitford, of Archdeacon Hare, and of Walter Savage Landor, of the strange spellings they sometimes employed. One favorite object of hatred with all these partial reformers was the *s* of *island*; and, certainly, if it be just to single out one thing for abuse where there is so much contemptible, this would be a fair case; for it is one of the worst fruits of that alliance—too common with us—between writers who knew too much and printers who knew too little. The *s* of *island* was never pronounced. It did not belong to the word from which it came; it was never so written for several hundred years in English. But the blundering etymology of the sixteenth century inserted an *s*, and the printing-offices of the seventeenth century established *s* and perpetuated it. It is now so firmly fixed in the affections of most of us that the thought of its rejection from the word brings grief to many a happy household and burdens the columns of the newspapers with many an indignant protest.

Most of these attempts at reform have, in fact, not only been partial, but they have been merely in the direction of a mechanical uniformity which had not the slightest reason in the nature of things upon which to base itself. One illustration of this effort to bring about change which was not improvement can be found in the alterations proposed at the end of the last century by Joseph Ritson. To scholars, Ritson is well known as the fiercest of antiquaries, who loved accuracy with the same passion that other men love persons, and who hated a mistake, whether arising from ignorance or inadvertence, as a saint might hate a deliberate lie. He is equally well known for his devotion to a vegetable diet, and for the exhibition, at least in criticism, of a bloodthirstiness of disposition which the most savage of carnivorous animals might have contemplated with envy. The alterations he proposed and carried out in his published works tended in certain ways toward formal regularity; but they also tended to make the divergence between the spelling and the pronunciation still wider. For instance, the so-called regular verb in English usually adds *ed* to form the preterite. Ritson made the general rule universal, and appended the termination, also, to words ending in *e*; so that the past tense, for example,

of *love*, *oblige*, and *surprise*, would appear as *loveed*, *obligeed*, and *surpriseed*. As no body pronounces the one *e* which already exists in these preterites, the insertion of another unnecessary letter could have only the effect of adding an extra weight to the burden which these unfortunate words were carrying, as it was. Other changes proposed by Ritson were not so bad as this, but they were all valueless. He himself, however, was too thoroughly honest a man to pretend that he had arrived at any knowledge of the principles which underlie the reconstruction of our orthography, and appeared at last to lose all confidence in his own alterations. Under his influence his nephew had also been affected with the fever of reform, and spelled many words in a way different from that commonly followed. Ritson, in a letter written in 1795, informed his kinsman that he—the latter—was entirely ignorant of the principles both of orthography and pronunciation, and rather wished to be singular than studied to be right. "For my part," he added, "I am as little fitted for a master as you are for a scholar."

Such changes as these of Ritson provoked amusement rather than opposition. The knowledge of them, indeed, hardly came to the ears of those devoted but never very well informed idolaters of the existing orthography, who feel that the future of the English language and literature depends upon its present spelling, and that the preservation of that spelling in its purity, or rather in its impurity, rests mainly upon them. They did not attack Ritson's views, because they never heard of them. These changes, again, were too unscientific in their nature to be worthy of serious consideration by one who had the least comprehension of the difficulties under which our orthography labors. Ritson himself lived long enough not only to doubt the value of his own efforts, but to see that his efforts had been attended by positive pecuniary disadvantage to himself. In a letter to Sir Walter Scott, written in 1803, he tells that author that his publishers, the Longmans, thought that the orthography made use of in his life of King Arthur had been unfavorable to its sale. Yet this was a work addressed to a class of persons who might be supposed peculiarly free from prejudices of this sort. A fact of such a kind speaks stronger than volumes of dissertations, as to the opposition which reform of spelling must overcome before it can be by any means even fairly considered.

But of these partial reforms it is the one proposed by Webster that is most familiar to Americans, and, perhaps, to all English-speaking readers; for the storm which it raised was violent enough at one time to be felt in all

lands where our tongue was employed. Nor has it so completely subsided that occasional mutterings of it are not even yet heard. The Websterian orthography, it is to be remarked at this point, is found only in its primitive, unadulterated purity in the edition of 1828. All dictionaries bearing other dates than that must be neglected by him who seeks to penetrate to the very well-head of this movement; for the author himself, or his revisers for him, bent before the orthographic gale, and silently struck out in the late editions every method of spelling which the popular palate could not be brought to endure, or inserted everything which it craved. No more than those who preceded him did Webster go to work upon correct principles, even when looked at from the point of view of a partial reform. One main defect pervading his plan was that it was an effort to alter the orthography, partly according to analogy and partly according to derivation. He could not well do both; and, moreover, he was often not consistent in the one, and very often not correct in the other. As far back as 1806 Webster had published an octavo dictionary of the English language. From that time for the next twenty years his attention was mainly directed to the compilation of such a work on a large scale. He soon found it necessary, he tells us, to discard the etymological investigations of his predecessors as being insufficient and untrustworthy, which they most certainly were; but, by way of remedying this defect, he devoted years to getting up a series of derivations which were more insufficient and untrustworthy still. In the process of doing this he made a study of some twenty languages, and formed a synopsis of the principal words in these, arranged in classes under their primary elements or letters. The results of this study were embodied in his dictionary of 1828, and the orthography was occasionally made to conform to it. Webster took a serene satisfaction in his new spellings; but it was upon his etymology that he prided himself. In his view it furnished a revelation of the hidden mysteries of language, and a solution of the problem of its origin. With his eyes intently fixed upon the tower of Babel, he probably never felt so happy as when he fancied he had come upon the trace of some English word found in the tongues made use of in the courts of Nimrod or Chedorlaomer. Nothing, indeed, could be absurder than the theory upon which he went, even had his assumed facts been trustworthy. The remote derivation of a word has little influence, either upon the present spelling or meaning; and the attempt to make it do full service in either capacity shows a total misconception of the

principles which regulate the development of both. The science of comparative philology was then, indeed, in its infancy, and Webster cannot be held blameworthy for not anticipating discoveries subsequently made; but that man can never be regarded as a safe guide, in any department of investigation, who contents himself with an imperfect theory and forces his facts to accommodate themselves to it. Especially is he an unsafe guide who, in the matter of derivation, leaves the domain of the historical and certain for the plausible and possible. Webster had just enough of that half-learning which enables a man, when he arrives at correct conclusions, to give wrong reasons for them; and it was a natural consequence that there should be a mixture of truth and error in his statements. One noted instance may be cited. In the edition of 1828 *bridegroom* appears as *bridegoom*, and the existing form is censured as a gross corruption which ought no longer to remain as a reproach to philology. It may be asked, Why? Because the second syllable is derived directly from the Anglo-Saxon *guma*, which means a "man," and the letter *r* has etymologically no business there whatever. So far as regards the derivation, the answer is well enough; equally true it is that, if the pronunciation is to be considered, there is a good deal of business for the letter *r*. But Webster went on to add that the corruption sprang from confounding the *groom* of the compound *bridegroom* with the simple word *groom*; so that *bridegroom*, as usually written, instead of being a bride's man, really means a bride's hostler,—a position to which the humblest of suitors could hardly be expected to look forward with longing eyes, at any rate as a permanent situation. For the original of *groom*, accordingly, he abandoned Europe and ventured into Asia, and there found a Persian word *germa*, meaning "hostler." This he captured and impressed into service, and made it do duty as the ancestor of *groom*; though when and under what circumstances it took its journey of several thousand miles to reach the English he did not think it worth while to tell us. There is scarcely any reasonable doubt that the *groom* of our simple word and of the compound is precisely the same, an *r* having been inserted in it, as in *vagrant*, *hoarse*, and several other words.

Strange to say, this weak and absurd etymologizing is even to this day spoken of with respect by many of Webster's critics, who have no feeling but horror for the conduct of the man that could seriously propose to spell *center* with *er* instead of *re*. It is a hard thing to say of a work which has taken up the greater part of the life-time of an earnest

student, that it is of little value; but there is not the slightest doubt that nearly all of Webster's supposed philological discoveries were the merest rubbish, and all inferences based upon them, in regard to the proper method of spelling, were utterly unworthy of respect. The derivation, indeed, had at last to follow the fate which had already overtaken a great deal of the new orthography. Its retention was a little too much for the last revisers of the dictionary, who in the edition of 1864 swept away at one fell swoop, into the limbo of forgettable and forgotten things, the fruits of twenty years of etymological study, and put in their place derivations which fairly represented the latest and best results of modern scholarship. Those conclusions, which in the eyes of the author had given him the key to unlock the hidden secrets of language, are no longer allowed to appear on the pages of the very work which perpetuates his name.

The changes of another sort, based upon analogy, which Webster introduced with the idea of making the spelling of certain classes of words uniform, are liable to little positive objection, at least by those who advocate merely a partial reform. A few of them, in spite of violent opposition, have in this country fully held their own. The consequence is, that in case of a certain number of words we have two methods of spelling in common use,—a state of things which, it seems to me, every one who has the reform of our orthography at heart must contemplate with unqualified satisfaction. Not that Webster's proposed changes, even had they been generally adopted, would have gone to the real root of the evil. Far from it. At best they merely touch the surface, and then in only a few places. But one effect they have produced. They have in some measure prevented us, and do still prevent us, from falling into the dead level of an unreasoning uniformity. By bringing before us two methods of spelling, they keep open the question of the legitimacy of each, and expose to every unprejudiced investigator the utter shallowness of the argument that opposes change. Slight as these alterations were, however, they met with the bitterest hostility on their introduction. The love of little things is deeply implanted in the human mind. It is, therefore, natural, perhaps, that the minor changes in spelling which Webster proposed should have met with an attack far more violent than that which was directed against his tremendous etymological speculations; and on the publication of Worcester's dictionary, which adhered to the generally received orthography, a wordy war arose which lasted

for years. Combatants from every quarter leaped at once into the arena. They were easily equipped for the contest, for virulence was the main thing required. Intellect was not essential to the discussion, and knowledge would have been a death-blow to it. The war of the dictionaries, as it was called, is therefore of interest to us at this point of time, not for any principle involved in it, but mainly as an illustration of how earnestly and even furiously men can be got to fight for a cause they do not understand. There is no question, indeed, but Webster laid himself open to attack. Perfect consistency is not to be looked for in this world; but the man who sets out to make only a partial reform of English orthography cannot help being inconsistent, and inadvertence will add failures of its own to the contradictions involved in the very incompleteness of his scheme. In both respects the lexicographer did not carry out the principles he had avowed. There were whole classes of words which he hesitated to change; and the reformer, no less than the woman who hesitates, is lost. Of these half-measures, whether due to oversight or to doubt, one illustration will suffice. No man who seeks to make orthography etymologically uniform can have failed to notice the difference in spelling in words derived from the compounds of the Latin *cedo*. Why should *proceed* be written with *ceed* and *precede* with *cede*? Here was a glaring anomaly which, on the principles of analogy, demanded to be removed, if anything did. But Webster was unequal to the occasion. He spelled, for instance, in the edition of 1828, *exceed* with *ceed* and *accede* with *cede*, which every one does, to be sure, but which he personally had no business to do. In conformity with his avowed views he was bound to make uniform the orthography of all the words which come from the Latin *cedo*. As he failed to do this, the same sort of contumely fell upon him that awaits every reformer who shrinks from the logical results of his own principles. The fact of the matter is that Webster was so much under the sway of the devil of derivation that spelling by analogy occupied a very subordinate position in his mind. His work is only deserving of notice because it happened in some cases to be successful. Its chief value, as has already been implied, consists in the fact that it has kept alive a feeling of hostility to the present orthography of the English tongue; that it has saved many from paying a silly and slavish deference to the opinions of a not very well-informed lexicographer of the eighteenth century; and that by these means it has given to some a hope, to others a fear, to all a warning, that, however long

Philistia may cling to her idols, they will be broken at last.

These slight attempts at change have met with unreasoning opposition in the past. Still the world does move. Many will now be found who, while utterly disapproving any project of radical reform, have yet got on to a point at which they are willing to admit that we are not so absolutely perfect that we cannot be improved. Some of those who naturally belong to the party of opposition to all change now go so far as to express themselves in favor of certain modifications and alterations. It is, of course, understood that these must be judicious—for that adjective always plays a conspicuous part when men are talking about measures which they do not thoroughly comprehend. It need hardly be said that none of these so-called judicious reforms, which consist merely in simplifying the spelling of certain words or certain classes of words, could ever be satisfactory, as a final result, to any one who had a clear conception of the nature of the problem to be solved, and, as a consequence, had in view a real and not pretended reformation of English orthography. True, he would sympathize with a movement of this kind, so far as it went. In fact, he would go farther. Nearly all the advocates of reform of orthography would unite in saying that it must be preceded by reform in orthography; that, imperfect and unsatisfactory as is the latter, it is a step necessary to be taken in order to arrive at the former. It is only thus that the tyranny of the existing system can be broken down, with all the absurd notions that have flourished under its shade,—notions of its sacredness, of its historical interest, of its etymological value, of its close connection with the literature of our tongue. But any movement that stopped short with changing the spelling of certain classes of words would be little improvement on the chaos in which we are at present; so little, indeed, that if it is not to be a stepping-stone to something better and complete, it would hardly be worth the time and trouble it would cost to bring it about. For this partial reform, this judicious alteration is not in any proper sense of the word a reform at all. At this point of the discussion it becomes a matter of first importance to bring out plainly and sharply the exact character of the evil which afflicts English orthography; for, often as it has been stated, it is evidently not yet comprehended by large numbers of even educated men. When once the nature of the disease is understood, it may not be easy to find the remedy that will cure it; but it

does become at once very manifest that certain nostrums which find favor with many will not cure it.

The fundamental evil does not lie in the existence of useless letters, which in so many cases are, in addition to their uselessness, the records of fictitious history or perverted etymology. This is something that needs especially to be insisted upon, because it is against these "interesting encumbrances and anomalies," as the London "Times" calls them, that efforts at reform are naturally at first directed; and what is only a side issue, though an important one, becomes to the minds of many the main issue. This fundamental evil, as it is generally stated, lies in the fact that our language, as at present spelled, has a multitude of signs for the same sound, and a multitude of sounds for the same sign. But an abstract statement of this kind means little or nothing to the mass of men; a few examples may make it mean a great deal. Let us take, for instance, the vowel-sound which is seen in the words *met*, *sweat*, *any*, *said*, *says*, and *jeopard*. Here is one sound, that of short *e*, which is represented in these various words by six different signs, by *e*, by *ea*, by *a*, by *ai*, by *ay*, by *eo*. Take again the vowel-sound heard in *rude*, *move*, *rood*, *routine*, *rheum*, *drew*, *shoe*, *rued*, and *bruise*. Here the same sound is represented by nine signs: by *u*, by *o*, by *oo*, by *ou*, by *eu*, by *ew*, by *oe*, by *ue*, and by *ui*. Take again the sound which we call "long *e*," which was originally with us represented by *i*, and which is still so represented in other languages. It is found in *meet*, *mete*, *meat*, *machine*, *grief*, *receive*, *key*, *people*, *ægis*, and is thus denoted by the nine different signs of *ee*, of *e*, of *ea*, of *i*, of *ie*, of *ei*, of *ey*, of *eo*, of *æ*. This will do for one side of the shield; the other cannot be said to present a more attractive view. The sign *ou* has six different sounds, according to it is found in the words *sour*, *pour*, *would*, *tour*, *sought*, and *couple*; the sign *ea* has five different sounds as seen in *heat*, *sweat*, *great*, *heart*, and *heard*. Illustrations similar to these could be multiplied; but enough have been given to show the nature of the evil under which we suffer. These, moreover, are neither accidental nor extreme instances of the lawlessness which runs riot in the spelling of our tongue. What is true of these vowels, or of these combinations of vowels, is true of all the others, and of the sounds denoted by them; and as there is no word into which a vowel does not enter, it follows that there is no English word which cannot be justifiably spelt according to the analogy of the received orthography in a variety of ways.

*Kind*, for illustration, can be written *keind*, for in this way is written *height*; it can be written *kuind*, for so is *guile*; it can be written *keynd*, for so is *eye*; it can be written *kynd*, for so is *type*; it can be written *kuynd*, for so is *buy*; it can be written *kaind*, for so is *aisle*; it can be written *kiend*, for so is *relied*. The whole vowel-system is in a state of chaos; and if confusion existed to the same extent among the consonants, the acquisition of English orthography would be the work of a life-time. Fortunately, the latter have largely remained true to the office for which they were created, though even here there are anomalies enough to give plenty of employment to those who favor partial measures of reform. Thus *d* has sometimes the sound of *t*, *f* that of *v*, *g* that of *j*, and the sound of *k* or "c hard" is not only represented by these two letters, but by *ch* and by *q*. But the trouble with the consonants is not only slight in itself, comparatively speaking, but, in the majority of cases where it exists, it is not that they are pronounced improperly, but that they are not pronounced at all.

It is a necessary consequence of the arbitrary and varying sounds given to the vowels, or the combinations of vowels, that learning to spell has become with us a purely mechanical process. As an intellectual discipline it is as utterly valueless as mere memorizing, where the student does not understand what he is going over. Like that, it is also a positive intellectual injury. At the very outset of his education the child is introduced into a study in which one natural process, that of reasoning from analogy, is summarily suppressed. He finds at once, because the sound in one word is represented one way, that it does not follow, as it ought, that in the next word he comes to it will be represented the same way. On the contrary, he finds it denoted by an entirely different combination of letters, for no reason which he can possibly discover. Instead of spelling doing the proper and legitimate business of teaching him the knowledge and distinction of sounds, it takes the speediest and most effectual method of preventing his attainment of any such knowledge; for it not merely neglects to call his attention to it, it forces him to disregard it, to look upon it as an element not properly to be considered. He does not learn to forget, for he never has known that there is any particular value to any vowel, or to any combination of vowels; and when he grows up he is naturally ready to despise what he is unable to comprehend. In the case of the consonants he is somewhat better off; and this is what saves our orthography from total anarchy, and makes it possi-

ble for any large number to learn it at all. An indirect but striking result of this lawlessness is that the English race, as a race, has no knowledge whatever of sounds; that one whole important domain of knowledge, which ought to have come to them through their spelling, almost without their being aware of it, is lost to them entirely. Evidences of this wide-spread and profound ignorance exist on every side, though they naturally find their most conspicuous public manifestation in the writings of those who argue in favor of the present orthography. Two or three years ago, a series of articles appeared in a Western periodical, attacking the movement in favor of a reform, and in it occur these sentences: "We are asked," says the author, "to spell *are* without the *e*, because that letter is not pronounced. Very well; then drop the *a*, for that is not pronounced either." In the same spirit the writer goes on to say that fanatical advocates of change should denote the words *see* and *sea* simply by *c* — "spelling only the letter sounded." Here is a person producing a series of articles on orthography who is so utterly unacquainted with the primary elementary facts of spelling as to fancy that the sound of *r* and *c* by themselves is the same as the name we give to those letters; who does not know that the name cannot be pronounced unless a vowel precedes the *r* and follows the *c*. Yet it is safe to say that nine out of every ten readers of these articles did not notice the absurdity of the statement which declares that *a* is not pronounced in *are*, or that *sea* and *see* could be properly spelled by simple *c*. It will be hard for many to comprehend it, even after their attention is called to it. This unnecessary ignorance reacts upon the feelings with which the idea of reform is regarded. The educated class have so largely with us come to look upon the alphabet as a mere mechanical contrivance, they have so entirely lost sight of the object for which it exists, that they are, in many cases, almost disposed to resent the proposition that they should employ it for the purposes for which it was created. It would be thinking too meanly of human nature, however, to infer that men could delight in this condition of things if they once came fully to appreciate it. But to that point very few of them ever arrive; and ignorance of the real evil disposes them to look with distrust upon any attempts to remedy it. Inaccurate assertions, based upon the loosest thinking, are constantly uttered. One writer gravely informs us that it is an insuperable objection to change of our orthography, that it would make necessary another formative period in the history of our language;

and, for fear that the full force of this terrible indictment should be overlooked, he prints it in italics. What possible conception can exist in the mind of such an objector as to what constitutes a formative period in the history of speech? Does spelling reform introduce new words or give new meanings to old ones? Does it destroy existing inflections or add any to their number? Does it vary in the slightest the order of words in the sentence or cause the least modification of the least important rule of syntax? It might just as reasonably be said that the putting on of a new suit of clothes makes necessary a new formative period in the history of a man's life. Yet the current objections to spelling reform are largely made up of assertions of this kind, which are nothing more than the results of inaccurate knowledge or careless thinking. The ignorance of the whole subject is sometimes amusing, sometimes disheartening; it is always appalling.

Owing, therefore, to the confusion into which our orthography has fallen and the attitude of mind which the men of our race have assumed toward the subject, the problem of reforming it would, under the most favorable circumstances, be a hard one. But it is, with us, complicated by difficulties of another kind. To get a proper conception of these, it is necessary to fix our eyes on an ideally correct condition of things. This can be stated briefly but clearly. In order that a language shall be spelled properly, it is necessary that every letter or combination of letters should have a fixed and unalterable sound wherever appearing; and, in turn, that every sound should have its fixed and unalterable representation in a particular letter or combination of letters. The moment a word is seen, the reader must know how to pronounce it; the moment it falls upon his ear the hearer must know how to spell it. Of all the cultivated tongues of Christendom we stand at the farthest remove from this ideally correct state. After us, though at a long distance, follows the French. It is partly our fault, and partly our misfortune, that this should be the case. If it continues to be such, it is wholly our fault. In exhibiting our exact condition, it is necessary to bring into sharp contrast the number of sounds existing in the language and the means of representing them afforded by the English alphabet. It is a view that not only makes clear the desirability of reform, but also the long and sustained effort that will be needed before it can be carried into practical effect.

Let us give its full weight here to one objection to spelling reform which has, what most objections have not, a show of reason.

The number of sounds belonging to our speech is differently given by different orthoëpists of established reputation. If here there were important and radical variations, this might justly be considered fatal to any scheme of reform. But this variation is very far from being either important or radical. It is confined to the representation of two or three vowel-sounds. It may possibly be due to differences of analysis, according to which a particular sound is looked upon by one man as entirely distinct from some other sound, and, by another man, as a mere shade of it; but far more probably, in fact, pretty certainly, it arises from actual difference of pronunciation. In any spelling reform, authoritatively established, such disagreements must be, and would be settled by compromise, by general concurrence in what was to be regarded as the proper pronunciation. Outside of the vowel-sounds referred to, there is no essential disagreement between leading orthoëpists; and, in consequence, the number of sounds in our language is stated almost invariably as somewhat over forty. The precise number is of no importance in the following discussion; and, for the sake of convenience, I shall follow the analysis of them as laid down for his own usage by Professor Whitney, in his essay on the Elements of English Pronunciation, contained in the volume forming the second series of his "Oriental and Linguistic Studies." In this analysis there are twenty-four sounds given to the consonants, and nineteen to the vowels and diphthongs; consequently, forty-three in all.

Before going farther, however, it may be well to give a passing notice to one ghastly specter of an argument that haunts the imagination of many opposers of spelling reform. This is, that variation of sounds are almost numberless, and cause a marked difference of pronunciation in different districts of the same country. They are, moreover, often so delicate as to defy representation. You could not denote them, they tell us, if you would; and if you could, you would be encumbered, rather than aided, by the multiplicity of signs. Of all the hallucinations that disturb the mental vision of the advocates of the existing orthography, this is, perhaps, the most dismal, as well as the most unreal. The answer is a simple and easy one: These differences would go unrepresented. No alphabet that is intended to be a working one would ever set out to distinguish any but broadly marked and clearly defined sounds. The philologist can get up for his own use characters conveying delicate distinctions, even of intonation; the common man does not need them. For the latter, it is no more important that

shades of sounds should be denoted in his alphabet than it would be important for him to lug about an astronomical clock, with a compensation pendulum warranted to preserve uniformity of movement in all temperatures and in all climates. It is, in truth, with our pronunciation as it is with our time-pieces. None of our watches run precisely alike. Few, if any, can be called unqualifiedly correct; yet, by the aid of these imperfect and always disagreeing instruments, we manage to transact, with little friction and delay, the daily business of a life in which we have constantly to depend upon one another. So, in the matter of sounds, a phonetic alphabet would mark only those broad and clear distinctions which are apparent to the ear of ordinary men. Orthography based upon such an alphabet would assume, as the very foundation upon which to build itself, the existence of a standard pronunciation. It is that alone which the spelling would recognize. Provincial speakers, as a consequence, would have always before their eyes, in the form of the word itself, the proper pronunciation of it, by which they would be able to compare, and, if necessary, to correct their own.

The real difficulties in the way, however, are great enough without troubling our thoughts about these imaginary ones, which are merely the offspring of limited knowledge or of limited capacity, or, more usually, of the combination of limited knowledge with large incapacity. The very statement of the problem itself shows how hard a one it is to solve. Assuming for our purposes the precise correctness of the analysis above given, there are forty-three sounds to be represented; there are twenty-six letters to represent them. Or, taking out of consideration the diphthongs, which can easily be indicated by the combination of the two vowels that enter into them, and the vocalic *n* and *l*, which would need no separate symbols, we have thirty-eight simple sounds to be represented by twenty-six letters.

Unfortunately, even this does not fairly state the difficulties of the problem. In our alphabet, as it now exists, some of the signs are superfluous. One of these is *g*, which has invariably the sound of *k*, or "*c* hard." It did not belong to the original English alphabet, but in that its place was supplied by *c*. *X* is another useless letter. At the beginning of words it is pronounced as *z*; in the middle as *ks* or *gz*; at the end as *ks*. Again, either *c* or *k* is unnecessary; for the former has ordinarily either the sound of the latter or that of *s*. Consequently the original statement of the problem needs modification. For

our thirty-eight sounds we have really but twenty-three signs, eighteen belonging to the consonants and five to the vowels. Of the thirty-eight sounds, orthoëpists agree in giving twenty-four to the so-called consonants. It follows, therefore, that in our present alphabet six of these consonant sounds have no special signs for their representation. These six are the sounds represented by the *ch* of *church*; by the *ng* of *sing*; by the *sh* of *ship*; by the *s* of *pleasure*, by the surd and sonant sounds of *th*, found respectively in *thin*, *bath*, and in *then*, *bathe*. It is not to be understood that these sounds are invariably represented by these letters or combinations of letters; far from it. The *sh* of *ship* is also represented by *ti* in *nation*, by *ci* in *gracious*, by *xi* in *anxious*, by *ce* in *ocean*, by *sci* in *conscience*, and by *s* in *sure*; the *s* of *pleasure* is also represented by the *z* of *azure*, the *si* of *occasion*, the *zi* of *glazier*. So much for the consonants. For the remaining fourteen vowel-sounds there are five signs. Assuming in theory what might be found difficult in practice, that each sign could be made properly to do the double duty of denoting the long and short sounds of the same vowel, there will still be left, according to this analysis, four vowel-sounds for which special signs are lacking.

Here, then, in the condition of the alphabet, is the great problem, stated briefly, that meets us in any real reform of our spelling. There are other difficulties to be overcome; but all together are insignificant as compared with this one. It is far from being a new problem. It has engaged the attention of men from an early period. There were several projects for reforming the spelling on phonetic principles during the sixteenth and seventeenth centuries; but all of them were the work of scholars, acting independently, and with little means of bringing their schemes to the attention of the public. They excited, in consequence, little if any notice at the time, and need not be described here. Some mention, however, is due, at least from us, of an attempt at reform undertaken in the latter half of the eighteenth century by one of the greatest of Americans. This was Benjamin Franklin. His ever active mind, busying itself with all matters that concern the welfare of the human race, was not apt to let this subject pass unobserved. In the sixth volume of the collected edition of his writings will be found discussions on a vast variety of topics, such as the properties of linseed oil, experiments on the culture of grass in meadows, the defects of modern music, and the cause and cure of smoky chimneys. Conspicuous among them is the scheme of a

new alphabet and a reformed mode of spelling. Into his alphabet Franklin introduced six new characters. Two of these were for the vowels, one representing the sound heard in the words *ball*, *song*, *haul*, *law*, *bought*, and *broad*; the other the sound heard in the words *but*, *love*, *flood*, and *touch*. The other four were for the consonants, representing the *sh* of *ship*, the *ng* of *sing*, and the two sounds clumsily represented in modern English by the *th* of *thin* and *then*. But, while he added six, Franklin omitted six of the present alphabet, *c*, *q*, *w*, *x*, *y*, and *z*, their places being taken by others or by combinations of others. To his account of this alphabet—an account which ends abruptly and is apparently unfinished—are appended examples of the new orthography, and a reply to objections brought against it. So firm was Franklin's faith in his scheme of reform that he set about compiling a dictionary, and procured types to be cast, which he subsequently offered to Webster with a view to engage him in the prosecution of his design. The latter declined the gift, as he himself declares, because he deemed the introduction of new characters into the language neither practicable nor expedient. Franklin's scheme was produced in 1768; but duties, at once graver and more stirring, not only distracted his attention from the project, but deprived him of both leisure and opportunity to carry it out. But, though he never published anything more bearing directly on this subject, there is no doubt that to his dying day he continued to entertain the most profound contempt for the existing orthography of the English tongue. Nor did he hesitate to express what he felt. In 1786, four years before his death, he referred to the subject in a letter written to a lady with whom he was in correspondence. "You need not," he said, "be concerned in writing to me about your bad spelling; for in my opinion, as our alphabet now stands, the bad spelling, or what is called so, is generally the best, as conforming to the sounds of the letters and of the words." This is, to say the least, stating it rather strongly; much more strongly, perhaps, than the most radical of modern reformers would be inclined to state it, unless he, too, were writing to a lady whose orthography deviated decidedly from the orthodox pattern.

The most noteworthy attempt, however, at reforming orthography on pure phonetic principles, has taken place during the present century. More than thirty years ago, Mr. Isaac Pitman, and Mr. Alexander J. Ellis, two names well known to linguistic students, perfected the invention of a new alphabet, in which every sound would be represented by

one character, and by one only. It consisted of forty letters. Books were printed in it, and during 1848 a phonetic journal was begun, or rather succeeded a so-called phonotypic journal previously existing. For a time the scheme met with some degree of favor, and the movement extended even to this country; but as a popular reform it attained notoriety rather than success. The public mind was not in the least prepared for a change so bold and sweeping in its character. But it would be a mistake to suppose that the influence of the attempt then made ever died out. To this day the phonetic periodical begun in 1848 has continued to appear regularly. It is still conducted by Mr. Pitman; its weekly circulation is over twelve thousand, and is steadily increasing. The influence, directly and indirectly exerted by it, especially in England, in furthering the movement now in progress, is something that can not well be estimated, or, perhaps, it would be more proper to say, can not well be over-estimated. It ought to be added that the phonetic alphabet now used by Mr. Pitman differs in certain respects from that previously devised by him and Mr. Ellis. His present one consists of forty-one letters, or combinations of letters, twenty-four being given to the consonants and seventeen to the vowels and diphthongs.

The details of these attempts, so far as they have been given, have been introduced mainly to make clear the nature of a fallacy that underlies many of the arguments of the reformers themselves. It is no unfrequent assertion on the part of some of them that such and such a proposed change cannot be carried through; and the reason invariably given has been that it has been tried in previous efforts and has failed. This is a mistaken inference drawn from an incorrect statement. The English-speaking race has never had an opportunity as yet to pronounce decisively whether it would favor or oppose any special scheme of reform; unless it is meant to be asserted that because some particular person has proposed a change which has been let alone by the rest of the world, that, therefore, the rest of the world is opposed to it and would always be opposed to it. For it is not by scattered and independent efforts that even slight reforms are carried; and the reform of English orthography is a very great one. It is not in such ways that the feelings of men are tested or their understandings enlightened. No reform of any kind ought to succeed, or ought to be expected to succeed, until it has been fully canvassed and discussed, until all possible objections have been urged against it, and all reasons for it made clear to those most interested. Nothing

of this has ever been done in the case of our orthography, save on a most limited scale. Even when the minds of many are fully convinced, such is the power of actual possession, that it would require positive and prolonged effort to dislodge what the judgments of men really disapproved, but which has been linked to their feelings by the associations of a life-time. The failures of the past are not at all surprising, if indeed it is right to apply the word failures to projects which, so far from gaining coöperation, have not been successful enough even to attract attention. From nothing which has been attempted can we draw any just inferences as to what can be done. Because individual men, or small companies of men, making inroads upon a kingdom disconnectedly, or at wide intervals of time, are unable to make upon it any perceptible impression, it does not follow that the attack of a great and regularly organized army will not succeed in overthrowing it. Moreover, the conditions now are different from what they have ever been before. For the first time all linguistic scholars are unanimous in regard to the desirability of change. Hitherto they have been divided in opinion, or, perhaps, it would be truer to say that the vast majority have been opposed to any interference with what has come to be established. As this unanimity of scholars can no longer be questioned, it is not at all unnatural that we should now be assured by the friends of the existing orthography that it is, after all, a matter of no real consequence; that, in truth, for a man's opinion to be of value on the subject of spelling reform, it is a decided disqualification that he should know too much about language generally, or about the particular language that is undergoing investigation. Such persons, we are told, come to look upon speech as a subject of historical inquiry, of analysis, of comparison; and long devotion to these topics so deadens their natural feelings that they cease to think of it as an instrument of communication. This doctrine of the advantages resulting from the lack of knowledge is so consolatory in its nature to its originators that its soundness will seem suspicious to most from that very fact. A ridiculous deference will, without doubt, still continue to be paid by many to the opinions of those who know something about the subject; at least until those who do not have authoritatively laid down the precise amount of ignorance of language it is necessary for one to acquire in order to constitute him a proper judge of what ought to be done in this matter of spelling reform.

I have sought to make clear the immense difficulties in the way of any genuine reform

of our orthography; to point out that these consist not merely in the hold it has upon the prejudice and ignorance of men, but in the lawlessness which pervades the whole of our spelling, and in the imperfection of the alphabet which aims to represent it. Languages that are already written, almost as they are pronounced, find no great hardship in introducing the few further improvements that are needed to bring them into perfect conformity. But the task before us is something so toilsome and perplexing that we cannot afford to have any false conceptions of its exact nature, or to underrate the exertions necessary to accomplish it. Least of all can we afford to engage in schemes which would imperil if not sacrifice ultimate success for the sake of a possible but partial reform which would prove so imperfect that it would require at some future time to be done over again. The movement can make its way only by slow steps. It is far better that it should be so, as it most certainly will be so. The point most to be insisted upon is, that the slight reforms which are adopted now shall be in the line of a thorough-going scientific reform. It is mere prejudices that must first be overthrown; and these always give way reluctantly. But the education of the public mind is already going on with us under the lead of a portion of the press, which has adopted and is, in consequence, making familiar new modes of spelling certain words; and the influence of this sort of education increases not arithmetically, but geometrically. It is efforts such as these that must and will pave the way to that general coöperation which is essential to complete success. True, it is quite possible that such coöperation will never be attained until after the failure of many particular projects. On details of the movement, opinion among the advocates of change is now divided. It is inevitable that this should be so; though by some it seems to be regarded as a subject of special reproach, that in reference to a great and wide-spread evil there should be difference of views as to what would best effect its cure. So long as this difference of view exists, however, it may not be improper in any one to express his opinion upon certain questions which are now to some extent matters of discussion, provided he does not assume to represent the sentiments of any besides himself.

The very first point of divergence among advocates of thorough reform is in regard to the manner of denoting sounds. All agree that each should have its special sign. Shall this be done by a combination of the present letters, or by the introduction of new ones? In reference to this question two parties exist,

though it is to be added that they do not differ as to the desirability of new characters, but as to the practicability of their adoption. It must certainly be admitted that the introduction of new letters is something that, in the present state of public opinion, would not meet with wide acceptance. But the Roman alphabet is so utterly inadequate to the demand made upon it for the representation of English sounds that the creation of new characters seems to me a necessity of the situation. Nor would they be more difficult of acceptance than the clumsy combinations which would be required if we confined ourselves to the existing imperfect alphabet. Our language, in the course of its history, has taken to itself letters that it did not need; unfortunately, it has let go some that it did need. To restore these latter and to introduce others would be a task far harder now than at any previous period; but, from what will be said farther on, it will be seen to be a task harder in appearance than in reality.

Another point of controversy is the necessity of a uniform, and therefore, in a certain sense, of a fixed orthography corresponding to pronunciation. There is a party among the advocates of reform who do not believe in this. Their number is apparently very small; but at the head of them is a scholar so distinguished as Mr. Alexander J. Ellis. It is a curious illustration of how extremes meet, that these men, despising and even spitting upon the existing orthography, as they do, are as hostile to the slightest change in it as its most fanatical advocates. "Alter our present spelling in detail," says Mr. Ellis, "and you destroy its sole merit. I have an intense dislike to *honor*, *favor*, *humor* (without *u*), *emperour* (plus *u*), *furnisht*, *announct*, *rhymes* (minus *h*), and so on. I have 'given in' to *drafft* for *draught*, but have not yet reached *laft* for *laughed*, and so on." Mr. Ellis believes only in an orthography that reflects the pronunciation of the speaker; and as the pronunciation would vary with the individual, so necessarily would the spelling. The existing method he would keep as a mechanical means of classifying words in a dictionary, and for that reason would have it fixed. "However much the language may hereafter vary," he says, in another place, "this crystallized form should remain. No change of any kind or from any cause should be permitted. Otherwise, to the enormous practical evil of an orthography which has no connection with sound, which helps no one to read and no one to spell, will be added the last stage of uncertainty."

According to his own theory it is obvious at a glance, that if Mr. Ellis's ideas could be carried into effect, the acquisition of the

standard spelling would still be a necessity for all of us in order to enjoy the advantage of the classification of it as found in the dictionary; and so long as we have to learn it, there is no reason why we should not use it for every purpose. But the conditions of modern life are utterly opposed to individuality of pronunciation or of its representation. Whatever may have been true of the past, a uniform orthography is a necessity of the present. Men now learn a large share of the language they use by the eye; and much of it which occurs in writing rarely enters into conversation. This is a state of things which renders reasoning inapplicable now which would have been true enough of a speech that was acquired wholly or almost wholly by the ear. The day has gone by when every man could be his own Webster or Worcester. The philologist who is in the habit of seeing the same word under different forms may not care for one that is fixed; to him who never reads at all, the subject would, of course, be a matter of indifference. But to the vast majority of men the word as spelled, and as spelled in a particular way, comes to have certain associations connected with it, by which it is made familiar and finally dear. It is in this fact that the strength of the present system lies; and any system which is to take its place must recognize and defer to a feeling which general habits of reading have made nearly universal. For it will increase, rather than decline, with the further spread of education. So marked is even now the influence of the training of the eye, as compared with that of the ear, that there is an effort consciously or unconsciously going on to modify the sound of the word as we have heard it, to the form of it which we have been accustomed to see. It is no unusual thing to hear persons painfully striving to pronounce the final *n* of *condemn*, *contemn*, and verbs like these, and making themselves very miserable when they fail, and others very miserable when they succeed. But the gap between the present spelling and pronunciation is with us too wide and impassable for the latter ever to close up. The most it can do is in the process of time to take up a few letters that are now silent, or substitute a few forms etymologically correct for the corruptions by which they have been supplanted.

It is for the reason just stated, if others were wanting, that a uniform orthography becomes a necessity. But this is something that seems to many a fatal objection to phonetic spelling. It is in reality one of the strongest arguments in its favor. Let me state fully and fairly the case of those who look upon this as a damaging admission. "You believe," they say, "in spelling accord-

ing to sound. Assuming that a standard pronunciation exists, that pronunciation is constantly changing: it is to that fact mainly that we owe the present divergence between it and its representation. Your orthography cannot be uniform, because your pronunciation is not uniform; it cannot remain fixed, because pronunciation does not remain fixed." This is an ancient and plausible objection, and, before the history of language was as well understood as it is now, appeared to some an insurmountable one. Uniform phonetic spelling, it has already been pointed out, assumes the existence of a standard classical pronunciation to be determined, if need be, by investigation, but, at any rate, to be determined. But phonetic spelling, when once established, will have the most marked influence upon fixity of form. Paradoxical as it may seem, it is nevertheless true, that radical reform of English orthography is a conservative movement. A phonetic spelling, once generally adopted, will as certainly check change in utterance as an established literature checks changes in inflections or in syntactical constructions. Pronunciation with us has been and is constantly varying, because there has not existed, nor does there exist, anywhere, a rule of right to which it feels called upon to conform. We are all at the mercy of this lawlessness. The life of every one of us is in this respect a series of surprises, as day by day we meet with some fresh illustration of that perpetual conflict which in our tongue is waged between the form of a word and its sound. No small share of our time is spent in the consultation of dictionaries for the purpose of ascertaining some authorized pronunciation; no insignificant part of our conversation is taken up with the discussion of this ever-present topic. But a phonetic spelling, once established, would teach its own pronunciation without help from any other quarter. Its existence would be the greatest barrier that could be erected against change of sound. The degradation of the fundamental vowel-tone of the voice, the *a* as heard in *father*, has been and is still going on rapidly; a fixed sign for the sound would at once arrest the process in all words in which it is now taking place. Variation in pronunciation there cannot fail to be while our language is a living one, just as there is variation in grammar and vocabulary; but, as with the latter that variation is reduced to the lowest possible limits when once a standard literature is created, so will it be with the former when once a standard phonetic spelling is established. Change of sound which then occurs will not as now be lawless,

subject to the freaks of fashion and the caprices of a fickle taste carrying into effect the fancies of a particular class. It will be too firmly fixed to be affected by agencies so slight as these. All the mighty influence wielded by education imposing its laws upon the child, and a printed literature appealing constantly to the eye of the adult, will be unceasingly at work to hold pronunciation steadily to its place. Whatever movement it undergoes will be in accordance with a general tendency, in which all members of the English-speaking race will share. As changes in grammar are now made only at long intervals of time, and are adopted slowly and sometimes imperceptibly, and without inconvenience to the users of speech, so it will be in the changes of sound which will take place when a phonetic spelling is employed by all. The influence of an agency so imperfect and so little referred to as the pronouncing dictionary has been conspicuously manifest during the past hundred years in arresting alteration in the utterance of words. How infinitely more conservative would be a method of representation which men do not consult occasionally and in particular instances, but every time they open a book and during every moment they read!

There is one further consideration connected with the practical adoption of any such reform. To me it seems utterly hopeless to expect that any large body of grown-up men, who have once learned a particular method of spelling, however wretched, will give it up and adopt another, however perfect. Individuals, in some cases from choice, in more cases from necessity, will doubtless do it; but never the great mass of the users of speech. Life is too short to go through that fiery trial a second time. A reformed orthography may be taught to a rising generation; it will never be widely received by one that has risen. It is not the man who has come, but the coming man, who will carry this work forward to a successful completion. Not that phonetic spelling, even with new characters, is difficult to acquire or to use. On the contrary, it is quite the reverse. The gravest objection that can be made against it by those who examine it is that they do not like the look of it. But, to employ in writing an unaccustomed spelling, even in the case of a single word, requires attention; and that in the hurry of life, and still more in the hurricane of business, the ordinary man has not the time to give. The most we can ask from such persons is sympathy with, or simple acquiescence in a reform in which they are not expected to take a part. To secure that will be of itself a great

achievement. In science, a revolution in nomenclature, such, for instance, as has taken place in chemistry, can be carried through with comparative ease. The class of persons affected by it is not large, and, moreover, they are persons who can be reasoned with,—persons with whom custom and prejudice weigh little, and to whom the inherent advantages of a proposed reform will outweigh the temporary inconveniences that necessarily belong to all change. But it is not so in language. A vast number must be consulted, each one of whom feels himself thoroughly acquainted with the subject, and the less he knows the more confident he is apt to be on that point. Add to this that with our race, especially the English portion of it, there seems to be a real affection for an anomaly, provided it has come down from a remote period; and the more uncouth and inconvenient and unreasonable the anomaly is, the fonder they are of it, and the closer they cling to it. Therefore, it is only little that has been done, when a select circle of scholars has been convinced of the desirability, and even the practicability of a proposed change. It must be made evident to the great body of educated men everywhere; it must have the favor of at least a majority of these before it can be put into successful operation. No royal academy, as in Spain, can, with us, issue recommendations which shall have the force of commands. No minister of state can, with us, as in Germany, prohibit the use of text-books that are not printed in the reformed spelling. But it is that last method alone that points out the only way in which success can be secured in such a tongue as ours. When authority enough of the whole body of educated men can be collected to consent to the introduction of a reformed orthography in our schools, its triumph will practically have been achieved; but it will not be till then. As it was to the spelling-book that we owe the establishment and perpetuation of the tyranny which the type-setters imposed upon us, so it is to the spelling-book that we must look for our deliverance. Where, indeed, the custom arose of teaching orthography, as it is now taught, it is hard to tell. Our Anglo-Saxon forefathers apparently knew nothing of it. With them a spelling-book was a book of stories or of homilies; and in the stormy times that then existed and followed, it was as much as a man could do to read and write; to write uniformly would have seemed as useless as to paint the lily or to add perfume to the violet. We know the peaceful friar who, far back in the tumult of the fifteenth century, compiled for school-boys the first important Latin-English dictionary. But tale of tradition or record of history

has failed to hand down the name of him who conceived the idea, and perpetrated the deed of preparing the first of modern spelling-books. Hardly can it be deemed a matter of regret; for little regard can be felt for the villain of a schoolmaster who leagued himself with the printing-office to fasten upon the children the yoke which indifference and ignorance had bound about the neck of the father; who employed the authority of education to turn a swindle and a fraud into an object of reverence. The deed may have been a necessary one; but even if so, it was a necessity to be deplored and not to be welcomed.

But the slightest consideration will show that it is only through the enginery of education that a reconstruction of our orthography can ever take place. It is, therefore, of first importance that any system which is to be accepted by all should be the work of the representatives of all. When once a standard phonetic spelling is agreed upon, and accepted by those who favor reform, its adoption in schools is the only further practical measure that will be essential to its success. Here are no prejudices to be overcome. Here, where the old characters themselves are new, new characters can be introduced without difficulty. Here alone can be accomplished, without the slightest trouble, that reform of the alphabet which must precede any real reform of the spelling. In this way, too, the active opposition will be disarmed of that large body of men who have no hostility to change which does not put them personally to additional annoyance or labor. Nor does it seem probable that the most inveterate admirer of the present anarchy could long hold out against the system of law and order which would then take its place. He might love the former for himself; yet he, in time, would hesitate to impose its burden upon those who are to come after him. If, because our fathers have eaten sour grapes, our teeth have been set on edge, there is no need of our insisting that that particular sensation shall be felt by all the generations to come. To children gifted

by nature, not necessarily with force of intellect, but with force of memory, learning to spell is, with our present orthography, mainly a tedious task, but not inevitably a difficult and sometimes not a particularly disagreeable one. To others, inferior only in the power of memorizing, it is something far different. It may be doubted, indeed, if in the mansions dolorous, which, while passing through life, we for a longer or shorter time inhabit, there is any sadder chamber for some than that which requires of us, before leaving its portals behind, a mastery of the separate parts of that clumsy and cast-iron frame-work in which we have inclosed the visible representation of our speech. The sorrows of childhood, keen as they are at the time, leave little impress upon the mind, and are soon effaced from the memory by profounder though not necessarily more painful sorrows. Arrived at the journey's end, we forget the toil and trouble of the journey itself. Nay, we do more than this. We insist that all who come after us shall suffer as we have suffered; shall turn over the same pages already wet with our tears; shall tread the same paths which our worn and blistered feet have trodden before. So far as we do this from ignorance, or from inability to see any better way, we are entitled to all that lenient judgment to which those are fairly entitled who know not what they do. But, to make an idol of the abomination of our present system of spelling, to cherish it and adore it as something precious in itself, and, therefore, to be perpetuated for all time, is a mark of irrationality which it will be hard to find surpassed amid the countless methods in which superstition has manifested itself. We speak feelingly of the degradation of those who bow down to gods made of stocks and stones; we send missionaries to turn them from the error of their ways; but I have yet to learn that, considering the difference of circumstances, there is among the most savage tribes any fetichism more senseless and more stupid than that which, with educated men among us, treats as worthy of respect or reverence the present orthography of the English tongue.

## THROUGH ONE ADMINISTRATION.\*

BY FRANCES HODGSON BURNETT,

Author of "That Lass o' Lowrie's," "Haworth's," "Louisiana," "A Fair Barbarian," etc., etc.

### CHAPTER XXIII.

BUT Bertha did not go abroad, and the season reached its height and its wane, and though Miss Jessup began to refer occasionally to the much-to-be-regretted delicacy of the charming Mrs. Amory's health, there seemed but little alteration in her mode of life.

"I will confide to you," she said to Colonel Tredennis, "that I have set up this effective little air of extreme delicacy as I might set up a carriage,—if I needed one. It is one of my luxuries. Do you remember Lord Farintosh's tooth, which always ached when he was invited out to dinner and did not want to go—the tooth which Ethel Newcome said nothing would induce him to part with? My indisposition is like that. I refuse to become convalescent. Don't prescribe for me, I beg of you."

It was true, as she had said, that the Colonel presented himself at the house less often than had been his wont, and that his visits were more frequently for Janey than for herself. "You will never hold out your hand to me when I shall not be ready to take it," he had said; but she did not hold out her hand, and there was nothing that he could do, and if he went to her he must find himself confronted with things he could not bear to see, and so he told himself that, until he was needed, it was best that he should stay away, or go only now and then.

But he always knew what she was doing. The morning papers told him that she was involved in the old unceasing round of excitement,—announcing that she was among the afternoon callers; that she received at home; that she dined, lunched, danced, appeared at charitable entertainments, and was seen at the theater. It became his habit to turn unconsciously to the society column before he read anything else, though he certainly found himself none the happier for its perusal.

But, though he saw Bertha less frequently, he did not neglect Richard. At this time he managed to see him rather often, and took some pains to renew the bloom of their first acquaintance, which had, perhaps, shown

itself a little on the wane, as Richard's friendships usually did in course of time. And perhaps, this waning having set in, Richard was not at first invariably so enthusiastically glad to see the large military figure present itself in his office. He had reasons of his own for not always feeling entirely at ease before his whilom favorite. As he had remarked to Planefield, Philip Tredennis was not a malleable fellow. He had unflinching habits of truth and remorseless ideas of what a man's integrity should be, and would not be likely to look with lenient or half-seeing eyes upon any palterings with falsehood and dishonor, however colored or disguised. And he did not always appear at the most convenient moment; there were occasions, indeed, when his unexpected entrance had put an end to business conferences of a very interesting and slightly exciting nature. These conferences had, it is true, some connection with the matter of the Westoria lands, and the Colonel had lately developed an interest in the project in question which he had not shown at the outset. He had even begun to ask questions about it, and had shown a desire to inform himself as to the methods most likely to be employed in manipulating the great scheme. He amassed, in one way and another, a large capital of information concerning subsidies and land grants, and exhibited remarkable intelligence in his mental investment of it. Indeed, there were times when he awakened in Richard a rather uneasy sense of admiration by the clearness of his insight and the practical readiness of his views.

"He has always been given to digging into things," Amory said to Planefield, after one of their interviews. "That is his habit of mind, and he has a steady business capacity you don't expect to find."

"What is he digging into this thing for?" Planefield asked. "He will be digging up something, one of these days, that we are not particularly anxious to have dug up. I am not overfond of the fellow myself. I never was."

Richard laughed a trifle uneasily.

"Oh, he's well enough," he said; "though I'll admit he has been a little in the way once or twice."

It is quite possible that the Colonel himself had not been entirely unaware of this latter fact, though he had exhibited no signs of his knowledge, either in his countenance or bearing; indeed, it would be difficult, for one so easily swayed by every passing interest as Richard Amory was, to have long resisted his manly courtesy and good nature. Men always found him an agreeable companion, and he made the most of his powers on the occasions which threw him, or in which he threw himself, in Amory's way. Even Plane-field admitted reluctantly, once or twice, that the fellow had plenty in him. It was not long before Richard succumbed to his personal influence with pleasurable indolence. It would have cost him too much effort to combat against it; and, besides this, it was rather agreeable to count among one's friends and supporters a man strong enough to depend on and desirable enough to be proud of. There had been times during the last few months when there would have been a sense of relief in the feeling that there was within reach a stronger nature than his own,—one on whose strength he knew he could rely. As their intimacy appeared to establish itself, if he did not openly confide in Tredennis, he more than once approached the borders of a confidence in his moments of depression. That he had such moments had become plain. He did not even look so bright as he had looked; something of his care-free, joyous air had deserted him, and now and then there were to be seen faint lines on his forehead.

"There is a great deal of responsibility to be borne in a matter like this," he said to Tredennis, "and it wears on a man." To which he added, a few seconds later, with a delightfully unconscious mixture of petulance and protest: "Confound it! why can't things as well turn out right as wrong?"

"Have things been turning out wrong?" the Colonel ventured.

Richard put his elbows on the table before him, and rested his forehead on his hands a second.

"Well, yes," he admitted. "Several things, and just at the wrong time, too. There seems a kind of fate in it,—as if, when one thing began, the rest must follow."

The Colonel began to bite one end of his long mustache reflectively as he looked at the young man's knitted brow.

"There is one thing you must understand at the outset," he said, at length. "When I can be made useful—supposing such a thing were possible—I am here."

Richard glanced up at him quickly. He looked a little haggard for the moment.

"What a steady, reliable fellow you are!"

he said. "Yes, I should be sure of you if—if the worst came to the worst."

The Colonel bit the ends of his mustache all the way home, and more than one passer-by on the avenue was aroused to wonder what the subject of his reflections might be, he strode along with so absorbed an air and frowned so fiercely.

"I should like to know what the worst is," he was saying to himself. "I should like to know what that means."

It was perhaps his desire to know what it meant which led him to cultivate Richard more faithfully still, to join him on the street, to make agreeable bachelor dinners for him, to carry him off to the theaters, and, in a quiet way, to learn something of what he was doing each day. It was, in fact, a delicate diplomatic position the Colonel occupied in these days, and it cannot be said that he greatly enjoyed it or liked himself in it. He was too honest by nature to find pleasure in diplomacy, and what he did for another he would never have done for himself. For the sake of the woman who rewarded his generosity and care with frivolous coldness and slight, he had undertaken a task whose weight lay heavily upon him. Since his first suspicions of her danger had been aroused, he had been upon the alert continually, and had seen many things to which the more indifferent or less practical were blind. As Richard had casually remarked, he was possessed of a strong business sense and faculty of which he was not usually suspected, and he had seen signs in the air which he felt boded no good for Richard Amory or those who relied on his discretion in business affairs. That the Professor had innocently relied upon it when he gave his daughter into his hands, he had finally learned; that Bertha never gave other than a transient thought—more than half a jest—to money matters, he knew. Her good fortune it had been to be trammelled neither by the weight of money nor the want of it,—a truly enviable condition which had, not unnaturally, engendered in her a confidence at once unquestioning and somewhat perilous. Tredennis had recalled more than once of late a little scene he had taken part in on the occasion of her signing a legal document Richard had brought to her.

"Shall I sign it here?" she had said, with exaggerated seriousness, "or shall I sign it there? What would happen to me if I wrote on the wrong line? Could not Laurence sign it for me in his Government hand, and give it an air of distinction? Suppose my hand trembled and I made a blot? I am not obliged to read it, am I?"

"I think I should insist that she read it,"

the Colonel had said to Richard, with some abruptness.

Bertha had looked up and smiled.

"*Shall* you insist that I read it?" she said. "I know what it says. It says 'whereas' and 'moreover' and 'in accordance' with 'said agreement' and 'in consideration of.' Those are the prevailing sentiments, and I am either the 'party of the first part' or the 'party of the second part'; and if it was written in Sanskrit, it would be far clearer to my benighted mind than it is in its present lucid form. But I will read it if you prefer it,—even though delirium should supervene."

It was never pleasant to Colonel Tredennis to remember this trivial episode, and the memory of it became a special burden to him as time progressed and he saw more of Amory's methods and tendencies. But it was scarcely for him to go to her, and tell her that her husband was not as practical a business man as he should be, that he was visionary and too easily allured by glitter and speciousness. He could not warn her against him and reveal to her the faults and follies she seemed not to have discovered. But he could revive something of Richard's first fancy for him, and make himself in a measure necessary to him, and perhaps gain an influence over him which might be used to good purpose. Possibly, despite his modesty, he had a half-conscious knowledge of the power of his own strong will and nature over weaker ones, and was resolved that this weak one should be moved by them, if the thing were possible.

Nor was this all. There were other duties he undertook, for reasons best known to himself. He became less of a recluse socially, and presented himself more frequently in the fashionable world. He was no fonder of gayety than he had been before, but he faced it with patience and courage. He went to great parties, and made himself generally useful. He talked to matrons who showed a fancy for his company, and was the best and most respectful of listeners; he was courteous and attentive to both chaperones and their charges, and by quietly persistent good conduct won additional laurels upon each occasion of his social appearance. Those who had been wont to stand somewhat in awe of him, finding nothing to fear on more intimate acquaintance, added themselves to the list of his admirers. Before the season was over, he had made many a staunch friend among matronly leaders of fashion, whose word was law. If such a thing could be spoken of a person of habits so grave, it might have been said that he danced attendance upon these ladies; but, though

such a phrase would seem unfitting, it may certainly be remarked that he walked attendance on them, and sought their favor and did their bidding with a silent faithfulness wonderful to behold. He accepted their invitations and attended their receptions; he escorted them to their carriages, found their wraps, and carried their light burdens with an imperturbable demeanor.

"What!" said Bertha one night, when she had seen him in attendance on the wife of the Secretary of State, whose liking for him was at once strong and warm, "what! is it Colonel Tredennis who curries the favor of the rich and great? It has seemed so lately! Is there any little thing in foreign missions you desire, or do you think of an Assistant-Secretaryship?"

"There is some dissatisfaction expressed with regard to the Minister to the Court of St. James," was his reply. "It is possible that he will be recalled. In that case may I hope to command your influence?"

But, many a time as he carried his shawls, or made his grave bow over the hand of a stately dowager, a half-sad smile crossed his face as he thought of the true reason for his efforts, and realized with a generous pang the depth of his unselfish perfidy. They were all kind to him, and he was grateful for their favors; but he would rather have been in his room at work, or trying to read, or marching up and down, thinking in his solitude. Janey entertained him with far more success than the prettiest *débutante* of the season could hope to attain, though there was no *débutante* among them who did not think well of him and admire him not a little. But, the reason which brought him upon this brightly lighted stage of action? Well, there was only one reason for everything now, he knew full well,—for his being sadder than usual, or a shade less heavy of heart, for his wearing a darker face or a brighter one, for his interest in society, or his lack of interest in it, for his listening anxiously and being upon the alert. The reason was Bertha. When he heard her name mentioned, he waited in silent anxiety for what followed; when he did not hear it, he felt ill at ease, lest it had been avoided from some special cause.

"What she will not do for herself," he said, "I must try to do for her. If I make friends and win their good opinions, I may use their influence in the future, if the worst should come to the worst, and she should need to be upheld. It is women who sustain women or condemn them. God forbid that she should ever lack their protection!"

And so he worked to earn the power to call upon this protection if it should be re-

quired, and performed his part with such steadfastness of purpose, that he made a place for himself such as few men are fortunate enough to make.

There was one friendship he made in these days, which he felt would not be likely to fade out or diminish in value. It was a friendship for a woman almost old enough to have been his mother,—a woman who had seen the world and knew it well, and yet had not lost her faith or charitable kindness of heart. It was the lady whom Bertha had seen him attending when she had asked him what object he had in view,—the wife of the Secretary of State, whose first friendly feeling for him had become a most sincere and earnest regard, for which he was profoundly grateful.

"A man to whom such a woman is kind must be grateful," he had said, in speaking of her to Agnes Sylvestre. "A woman who is good and generous, who is keen, yet merciful, whose judgment is ripe, and whose heart is warm, who has the discernment of maturity and the gentleness of youth,—it is an honor to know her and be favored by her. One is better every time one is thrown with her, and leaves her presence with a stronger belief in all good things."

It had perhaps been this lady's affection for Professor Herrick which had at the outset directed her attention to his favorite; but, an acquaintance once established, there had been no need of any other impetus than she received from her own feminine kindliness, quickness of perception, and sympathy. The interest he awakened in most feminine minds he had at once awakened in her own.

"He looks," she said to herself, "as if he had a story, and hardly knew the depth of its meaning himself."

But, though she was dexterous enough at drawing deductions, and heard much of the small talk of society, she heard no story. He was at once soldier and scholar; he was kind, brave, and generous; men spoke well of him, and women liked him; his past and present entitled him to respect and admiration—but there was no story mentioned in any discussion of him. He seemed to have lived a life singularly uneventful, so far as emotional experiences were concerned.

"Nevertheless," she used to say, when she gave a few moments to sympathetic musing upon him, "nevertheless—"

She observed his good behavior, notwithstanding he did not enjoy himself greatly in society. He was attentive to his duties without being absorbed in them, and, when temporarily unoccupied, wore a rather weary and abstracted look.

"It is something like the look," she once

remarked inwardly, "*something* like the look I have seen in the eyes of that bright and baffling little Mrs. Amory, who seems at times to be obliged to recall herself from somewhere."

She had not been the leader of this world of hers without seeing many things and learning many lessons, and, as she had stood, giving her greeting to the passing multitude week after week, she had gained a wonderful amount of experience and knowledge of her kind. She had seen so many weary faces, so many eager ones, so many stamped with care and disappointment; bright eyes had passed before her which one season had saddened; she had heard gay voices change and soft ones grow hard; she had read of ambitions frustrated and hopes denied, and once or twice had seen with a pang that somewhere a heart had been broken.

Naturally, in thus looking on, she had given some attention to Bertha Amory, and had not been blind to the subtle changes through which she had passed. She thought she could date the period of these changes. She remembered the reception at which she had first noted that the girlish face had begun to assume a maturer look, and the girlish vivacity had altered its tones. This had happened the year after the marriage, and then Jack had been born, and when society saw the young mother again the change in her seemed almost startling. She looked worn and pale, and showed but little interest in the whirl about her. It was as if suddenly fatigue had overtaken her, and she had neither the energy nor the desire to rally from it. But, before the end of the season she had altered again, and had a touch of too brilliant color, and was gayer than ever.

"Rather persistently gay," said the older woman. "That is it, I think."

Lately there had been a greater change still and a more baffling one, and there had appeared upon the scene an element so new and strange as to set all ordinary conjecture at naught. The first breath of rumor which had wafted the story of Planefteld's infatuation and the Westoria schemes had been met with generous displeasure and disbelief; but, as time went on, it had begun to be more difficult to make an effort against discussion which grew with each day and gathered material as it passed from one to another. The most trivial circumstance assumed the proportions of proof when viewed in the light of the general too vivacious interest. When Senator Planefteld entered a room, people instantly cast about in search of Mrs. Amory, and reposed entire confidence in the immediately popular theory that, but for the pres-

ence of the one, the absence of the other would have been a foregone conclusion. If they met each other with any degree of vivacity, the fact was commented upon in significant asides; if Bertha's manner was cold or quiet, it was supposed to form a portion of her deep-laid plan for the entire subjugation of her victim. It had indeed come to this at last, and Tredennis's friend looked on and listened bewildered to find herself shaken in her first disbelief by an aspect of affairs too serious to be regarded with indifference. By the time the season drew toward its close, the rumor, which had at first been accepted only by rumor-lovers and epicures in scandal, had found its way into places where opinion had weight and decision was a more serious matter. In one or two quiet establishments there was private debating of various rather troublesome questions, in which debates Mrs. Amory's name was frequently mentioned. Affairs as unfortunate as the one under discussion had been known to occur before, and it was not impossible that they might occur again; it was impossible to be blind to them, it was impossible to ignore or treat them lightly, and certainly something was due to society from those who held its reins in their hands for the time being.

"It is too great leniency which makes such things possible," some one remarked. "To a woman with a hitherto unspotted reputation and in an entirely respectable position, they should be impossible."

It was on the very evening that this remark was made that Bertha expressed a rather curious opinion to Laurence Arbuthnot.

"It is dawning upon me," she said, "that I am not quite so popular as I used to be, and I am wondering why."

"What suggested the idea?" Laurence inquired.

"I scarcely know," she replied, a little languidly, "and I don't care so much as I ought. People don't talk to me in so animated a manner as they used to—or I fancy they don't. I am not very animated myself, perhaps. There is a great deal in that. I know I am deteriorating conversationally. What I say hasn't the right ring exactly, and I suppose people detect the false note, and don't like it. I don't wonder at it. Oh, there is no denying that I am not so much overpraised and noticed as I used to be."

And then she sat silent for some time and appeared to be reflecting, and Laurence watched her with a dawning sense of anxiety he would have been reluctant to admit the existence of, even to himself.

A FEW days after this, she told Richard that she wished to begin to make her arrangements for going away for the summer.

"What, so early!" he exclaimed with an air of some slight discontent. "It has been quite cool so far!"

"I remained too late last year," she answered. "And I want to make up for lost time."

They were at dinner, and he turned his wine-glass about restlessly on the table-cloth.

"Are you getting tired of Washington?" he asked. "You seem to be."

"I am a little tired of everything just now," she said, "even——" with a ghost of a laugh, "of the Westoria lands and Senator Planeffeld."

He turned his wine-glass about again.

"Oh!" he said, his voice going beyond the borders of petulance, "it is plain enough to see that you have taken an unreasonable dislike to Planeffeld."

"He is too large and florid, and absorbs too much of one's attention," she replied coldly.

"He does not always seem to absorb a great deal of yours," Richard responded, knitting his delicate, dark brows. "You treated him cavalierly enough last night, when he brought you the roses."

"I am tired of his roses!" she exclaimed with sudden passion. "They are too big and red and heavy! They cost too much money! They fill all the air about me! They weight me down, and I never seem to be rid of them! I won't have any more! Let him give them to some one else!" And she threw her bunch of grapes on her plate, and dropped her forehead on her hands with a childish gesture of fatigue and despair.

Richard knitted his brows again. He regarded her with a feeling very nearly approaching nervous dread. This would not do, it was plain.

"What is the matter with you?" he said. "What has happened? It isn't like *you* to be unreasonable, Bertha."

She made an effort to recover herself, and partly succeeded. She lifted her face and spoke quite gently and deprecatingly.

"No," she said. "I don't think it is; so you will be all the readier to overlook it, and allow it to me as a luxury. The fact is, Richard, I am not growing any stronger, and——"

"Do you know," he interrupted, "I don't understand that. You used to be strong enough."

"One has to be very strong to be strong

enough," she replied, "and I seem to have fallen a little short of the mark."

"But it has been going on rather a long time, hasn't it?" he inquired. "Didn't it begin last winter?"

"Yes," she answered in a low voice, "it began then."

"Well, you see, that is rather long for a thing of that sort to go on without any special reason."

"It has seemed so to me," she responded, without any change of tone.

"Haven't you a pretty good appetite?" he inquired.

She raised her eyes suddenly, and then dropped them again. He had not observed what a dozen other people had seen.

"No," she answered.

"Don't you sleep well?"

"No."

"Are you thinner? Well, yes," giving her a glance of inspection. "You are thinner. Oh! come, now, this won't do at all!"

"I am willing to offer any form of apology you like," she said.

"You must get well," he answered, "that is all." And he rose from his seat, went to the mantel for a cigarette, and returned to her side, patting her shoulder encouragingly. "You would not be tired of Planefteld, if you were well. You would like him well enough."

The change which settled upon her face was one which had crossed it many a time without his taking note of it. Possibly the edge of susceptibilities so fine and keen as his is more easily dulled than that of sensitiveness less exquisite. She arose herself.

"That offers me an inducement to recover," she said. "I will begin immediately—to-day—this moment. Let me light your cigarette for you."

After it was done, they sauntered into the library together and stood for a moment looking out of the window.

"Do you know," she said at length, laying her hand on his sleeve, "I think even you are not quite yourself. Are you an invalid too?"

"I?" he said. "Why do you think so?"

"For a very good reason," she answered. "For the best of reasons. Two or three times lately you have been a trifle out of humor. Are you aware of it? Such, you see, is the disadvantage of being habitually amiable. The slightest variation of your usually angelic demeanor lays you open to the suspicion of bodily ailment. Just now, for instance, at table, when I spoke to you about going away, you were a little—not to put too fine a point upon it—cross."

"Was I?"

Her touch upon his sleeve was very soft

and kind, and her face had a gentle, playful appeal on it.

"You really were," she returned. "Just a little—and so was I. It was more a matter of voice and manner, of course, but we didn't appear to our greatest advantage, I am afraid. And we have never done things like that, you know, and it would be rather bad to begin now, wouldn't it?"

"It certainly would," he replied. "And it is very nice in you to care about it."

"It would not be nice in me not to care," she said. "Just for a moment, you know, it actually sounded quite—quite married. It seemed as if we were on the verge of agreeing to differ about—Senator Planefteld."

"We won't do it again," he said. "We will agree to make the best of him."

She hesitated a second.

"I will try not to make the worst," she returned. "There is always a best, I suppose. And so long as you are here to take care of me, I need not—need not be uncomfortable."

"About what?" he asked.

She hesitated again, and a shade of new color touched her cheek.

"I don't think I am over fastidious," she said, "but he has a way I don't like. He is too fulsome. He admires me too much. He pays me too many compliments. I wish he would not do it."

"Oh! come, now," he said gayly, "that is prejudice! It is worse than all the rest. I never heard you complain of your admirers before, or of their compliments."

She hesitated a moment again. It was not the first time she had encountered this light and graceful obstinacy, and found it more difficult to cope with than words apparently more serious.

"I have never had an admirer of exactly that quality before," she said.

"Oh!" he said, airily, "don't argue from the ground that it is a bad quality."

"Has it never struck you," she suggested, "that there is something of the same quality, whether it is good, bad, or indifferent, in all the persons who are connected with the Westoria lands? I have felt once or twice lately, when I have looked around the parlors, as if I must suddenly have emigrated, the atmosphere was so different. They have actually rather crowded out the rest—those men."

It was his turn to pause now, and he did so, looking out of the window evidently ill at ease, and hesitant for the moment.

"My dear child," he said, at length, "there may be truth in what you say; but—I may as well be frank with you—the thing is necessary."

"Richard," she said quickly, prompted to the question by a sudden, vague thought, "what have *you* to do with the Westoria lands? Why do you care so much about them?"

"I have everything to do with them—and nothing," he answered. "The legal business connected with them, and likely to result from the success of the scheme, will be the making of me, that is all. I haven't been an immense success so far, you know, and it will make me an immense success and a man of property. Upon my word, a nice little lobbyist *you* are, to look frightened at the mere shadow of a plot!"

"I am not a lobbyist," she exclaimed. "I never wanted to be one! That was only a part of the nonsense I have talked all my life. I have talked too much nonsense. I wish—I wish I had been different!"

"Don't allow your repentance to be too deep," he remarked dryly. "You won't be able to get over it."

"It is too late for repentance; but I shall not be guilty of that particular kind of folly again. It was folly—and it was bad taste—"

"As I had not observed it, you might have been content to let it rest," he interrupted.

She checked herself in the reply she was about to make, clasping her hands helplessly.

"Oh, Richard!" she said, "we are beginning again!"

"So we are," he responded, coolly; "we seem to have a tendency in that direction."

"And it always happens," she said, "when I speak of Senator Planeffield, or of going away."

"You have fallen into the habit of wanting to go away lately," he answered. "You wanted to go to Europe —"

"I want to go still," she interposed, "very much."

"And I wish you to remain here," he returned petulantly. "What is the use of a man's having a wife at the other side of the globe?"

She withdrew a pace and leaned against the side of the window, letting her eyes rest upon him with a little, bitter smile. For the moment she had less care of herself and of him than she had ever had before.

"Ah!" she said, "then you keep me here because you love me?"

"Bertha!" he exclaimed.

Even his equable triviality found a disturbing element in the situation.

"Richard," she said, "go and finish your cigarette out of doors. It will be better for both of us. This has gone far enough."

"It has gone too far," he answered nervously. "It is deucedly uncomfortable, and it isn't our way to be uncomfortable. Can't we make it smooth again? Of course we can! It would not be like you to be implacable.

I am afraid I was a trifle irritable. The fact is, I have had a great deal of business anxiety lately,—one or two investments have turned out poorly,—and it has weighed on my mind. If the money were mine, you know—but it is yours —"

"I have never wished you to feel the difference," she said.

"No," he replied. "Nothing could have been nicer than your way about it. You might have made me very uncomfortable, if you had been a hard, business-like creature; but, instead of that, you have been charming."

"I am glad of that," she said, and she smiled gently as he put his arm about her, and kissed her cheek.

"You have a right to your caprices," he said. "Go to your summer haunts of vice and fashion, if you wish to, and I will follow you as soon as I can; but we won't say any more about Europe, just at present, will we? Perhaps next year."

And he kissed her again.

"Perhaps next year or the year after," she repeated, with a queer little smile. "And—and we will take Senator Planeffield with us."

"No," he answered, "we will leave him at home to invest the millions derived from the Westoria lands."

And he went out with a laugh on his lips.

A week later Colonel Tredennis heard from Richard that Bertha and the children were going away.

"When?" asked the Colonel. "That seems rather sudden. I saw Janey two days ago, and did not understand that the time was set for their departure."

"It is rather sudden," said Richard. "The fact is, they leave Washington this morning. I should be with them now if it were not for a business engagement."

## CHAPTER XXV.

THE next few weeks were not agreeable ones to Richard Amory. There was too much feverish anxiety and uncertainty in them. He had not yet acquired the coolness and hardihood of experience, and he felt their lack in himself. He had a great deal at stake, more than at the outset it had seemed possible he could have under any circumstances. He began to realize with no little discomfort that he had run heavier risks than he had intended to allow himself to be led into running. When they rose before him in their full magnitude, as they did occasionally when affairs assumed an unencouraging aspect, he wished his enthusiasm had been less great. It could

not be said that he had reached remorse for, or actual repentance of, his indiscretions; he had simply reached a point when discouragement led him to feel that he might be called upon to repent by misfortune. Up to this time it had been his habit to drive up to the Capitol in his coupé, to appear in the galleries, to saunter through the lobby, and to flit in and out of committee-rooms with something of the air of an amateur rather enjoying himself; he had made himself popular, his gayety, his magnetic manner, his readiness to be all things to all men, had smoothed his pathway for him, while his unprofessional air had given him an appearance of harmlessness.

"He's a first-rate kind of fellow to have on the ground when a thing of this sort is going on," one of the smaller satellites once remarked. "Nobody's afraid of being seen with him. There's an immense deal in that. There are fellows who come here who can half ruin a man with position by recognizing him on the street. Regular old hands they are—working around here for years, making an honest living out of their native land. Every one knows them and what they are up to. Now, this one is different, and that wife of his —"

"What has she been doing?" flung in Plane-field, who was present. "What has she got to do with it?"

He said it with savage uneasiness. He was full of restive jealousy and distrust in these days.

"I was only going to say that she is known in society," he remarked, "and she is the kind the most particular of those fellows don't object to calling on."

But, as matters took form and a more critical point was neared, as the newspapers began to express themselves on the subject of the Westoria lands scheme, and prophesy its failure or success, as it became the subject of editorials applauding the public-spiritedness of those most prominent in it, or of paragraphs denouncing the corrupt and self-seeking tendency of the times, as the mental temperature of certain individuals became a matter of vital importance, and the degree of cordiality of a greeting an affair of elation or despair, Richard felt that his air of being an amateur was becoming a thing of the past. He was too anxious to keep it up well; he did not sleep at night, and began to look fagged, and found it required an effort to appear at ease.

"Confound it!" he said to Plane-field, "how can one be at ease with a man when his yes or no may be success or destruction to you. It makes him of too much consequence. A fellow finds himself trying to please, and it spoils his manner. I never knew what it was

to feel a human being of any particular consequence before."

"You have been lucky," commented Plane-field not too tolerantly.

"I have been lucky," Richard answered, "but I'm not lucky now, and I shall be deucedly unlucky if that bill doesn't pass. The fact is, there are times when I half wish I hadn't meddled with it."

"The mistake *you* made," said Plane-field, with stolid ill-humor, "was in letting Mrs. Amory go away. Now is the time you need her most. There's no denying that there are some things women can do better than men; and when a man has a wife as clever as yours, and as much of a social success, he's blundering when he doesn't call on her for assistance. One or two of her little dinners would be the very things just now for the final smoothing down of one or two rough ones who haven't opinions unless you provide them with them. She'd provide them with them fast enough. They'd only have one opinion when she'd done with them, if she was in one of the moods I've seen her in sometimes. Look how she carried Bowman and Pell off their feet the night she gave them the description of that row in the House. And Hargis, of North Carolina, swears by her; he's a simple, domesticated fellow, and was homesick the night I brought him here, and she found it out, heaven knows how, and talked to him about his wife and children until he said he felt as if he'd seen them. He told me so with tears in his eyes. It is that kind of thing we want now."

"Well," said Richard, nervously, "it isn't at our disposal. I don't mind telling you that she was rather out of humor with the aspect of affairs before she went away, and I had one interview with her which showed me it would be the safest plan to let her go."

"Out of humor!" said Plane-field. "She has been a good deal out of humor lately, it seems to me. Not that it's any business of mine; but it's rather a pity, considering circumstances."

Richard colored, walked a few steps, put his hands in his pockets and took them out again. Among the chief sources of anxious trouble to him had been that, of late, he had found his companion rather difficult to get along with. He had been irritable, and even a trifle overbearing, and had at times exhibited an indifference to results truly embarrassing to contemplate, in view of the crisis at hand. When he intrenched himself behind a certain heavy stubbornness in which he was specially strong, Richard felt himself helpless. The big body, the florid face, the doggedly unresponsive eye, were too much to combat

against. When he was ill-humored, Richard knew that he endeavored to conciliate him; but when this mood held possession he could only feel alarm and ask himself if it could be possible that, after all, the man might be brutal and false enough to fail him. There were times when he sat and looked at him unwillingly, fascinated by the likeness he found in him to the man who had sent poor Westor to his doom. Naturally, the old story had been revived of late, and he heard new versions of it and more minute descriptions of the chief actors, and it was not difficult for an overwrought imagination to discover in the two men some similarity of personal characteristic. Just at this moment there rose within him a memory of a point of resemblance between the pair which would have been extremely embarrassing to him if he had permitted it to assume the disagreeable form of an actual fact. It was the resemblance between the influences which had moved them. In both cases it had been a woman—in this case it was his own wife, and if he had not been too greatly harassed he would have appreciated the indelicacy of the situation. He was not an unrefined person in theory, and his sensitiveness would have caused him to revolt at the grossness of such a position if he had not had so much at stake and been so overborne by his associates. His mistakes and vices were always the result of circumstance and enthusiasm, and he hurried past them with averted eyes and refused to concede to them any substantiality. There is nothing more certain than that he had never allowed himself to believe that he had found Bertha of practical use in rendering Planefteld docile and attracting less important luminaries. Bertha had been very charming and amiable, that was all; she was always so; it was her habit to please people,—her nature, in fact,—and she had only done what she always did. As a mental statement of the case, nothing could be more simple than this, and he was moved to private disgust by his companions' aggressive clumsiness, which seemed to complicate matters and confront him with more crude suggestions.

"I am afraid she would not enjoy your way of putting it," he said.

Planefteld shut his teeth on his cigar and looked out of the window. That was his sole response, and was a form of bullying he enjoyed.

"We must remember that—that she does not realize everything," continued Richard, uneasily; "and she has not regarded the matter from any serious standpoint. It is my impression," he added, with a sudden sense of growing irritation, "that she wouldn't have

anything to do with it if she thought it was a matter of gain or loss!"

Planefteld made no movement. He was convinced that this was a lie, and his look out of the window was his reply to it.

Richard put his hands into his pockets again and turned about, irritated and helpless.

"You must have seen yourself how impractical she is," he exclaimed. "She is a mere child in business matters. Any one could deceive her."

He stopped and flushed without any apparent reason. He found himself looking out of the window too, with a feeling of most unpleasant confusion. He was obliged to shake it off before he spoke again, and when he did so it was with an air of beginning with a fresh subject.

"After all," he said, "everything does not depend upon influence of that sort. There are other things to be considered. Have you seen Blundel?"

"You can't expect a man like Blundel," said Planefteld, "to be easy to manage. Blundel is the possessor of a moral character, and when a man has a capital like that—and Blundel's sharpness into the bargain—he is not going to trifle with it. He's going to hold on to it until it reaches its highest market value, and then decide which way he will invest it."

Richard dropped into a seat by the table. He felt his forehead growing damp.

"But if we are not sure of Blundel?" he exclaimed.

"Well, we are not sure of Blundel," was the answer. "What we have to hope is that he isn't sure of himself. The one thing you can't be sure of is a moral character. Impeccability is rare, and it is never easy for an outsider to hit on its exact value. It varies, and you have to run risks with it. Blundel's is expensive."

"There has been a great deal of money used," hesitated Richard, "a great deal."

Planefteld resorted to the window again. It had not been his money which had been used. He had sufficient intellect to reap advantages where they were to be reaped, and to avoid indiscreet ventures.

"You had better go and see Blundel yourself," he said after a pause. "I have had a talk with him, and made as alluring a statement of the case as I could, with the proper degree of caution, and he has had time to put the matter in the scales with his impeccability and see which weighs the heavier, and if they can't be made to balance. He will try to balance them, but if he can't — You must settle what is to be done between you. I have done my best."

"By Jove!" exclaimed Richard, virtuously, "what corruption!"

It was an ingenuous ejaculation, but he was not collected enough to appreciate the native candor of it himself at the moment. He felt that he was being hardly treated, and that the most sacred trusts of a great nation were in hands likely to betray them at far too high a figure. The remark amounted to an outburst of patriotism.

"Have they *all* their price?" he cried.

Plane-field turned his head slowly and glanced at him over his shoulder.

"No," he said; "if they had, you'd find it easier. There's your difficulty. If they were all to be bought, or none of them were to be sold, you'd see your way."

It did not seem to Richard that his way was very clear at the present moment. At every step of late he had found new obstacles in his path and new burdens on his shoulders. People had so many interests and so many limitations, and the limitations were always related to the interests. He began to resolve that it was a very sordid and business-like world in which human lot was cast, and to realize that the tendency of humanity was to coarse prejudice in favor of itself.

"Then I had better see Blundel at once," he said, with feverish impatience.

"You haven't any time to lose," was Plane-field's cool response. "And you will need all the wit you can carry with you. You are not going to offer *him* inducements, you know; you are only going to prove to him that his chance to do something for his country lies before him in the direction of the Westoria lands. After that —"

"After that," repeated Richard, anxiously.

"Do what you think safest and most practicable."

As the well-appointed equipage drew up under the archway before the lower entrance to the north wing of the Capitol, a group of men who stood near the doorway regarded it with interest. They did so because three of them were strangers and sightseers, and the fourth, who was a well-seasoned Washingtonian, had called their attention to it.

"There," he said, with an experienced air, "there is one of them this moment. It is beginning to be regarded as a fact that he is mixed up with one of the biggest jobs the country has ever known. He is up to his ears in this Westoria business, it's believed, though he professes to be nothing more than a sort of interested looker-on and a friend of the prime movers. He's a gentleman, you see, with a position in society, and a pretty wife who is a favorite, and the pretty wife entertains his friends; and when a man is in an un-

certain frame of mind, the husband invites him to dinner, and the pretty wife interests herself in him. She knows how to do it, they say—and he goes away a wiser and a better man, and more likely to see his way to making himself agreeable. Nothing professional about it, don't you see. All quite proper and natural. No lobbying about that, you know—but it helps a bill through wonderfully. I tell you there's no knowing what goes on in these tip-top parlors about here."

He said it with modest pride and exultation, and his companions were delighted. They represented the average American with all his ingenuous eagerness for the dramatic exposure of crime in his fellow-man. They had existed joyously for years in the belief that Washington was the seat of corruption, bribery, and fraud; that it was populated chiefly with brilliant female lobbyists and depraved officials who carried their privileges to market and bartered and sold them with a guileless candor, whose temerity was only to be equaled by its brazen cheerfulness of spirit. They were, probably, not in the least aware of their mental attitude toward their nation's government, but they reveled in it none the less, and would have felt a keen pang of disappointment if they had been suddenly confronted with the fact that there was actually an element of most unpicturesque honesty in the House and a flavor of shameless impeccability in the Senate. They had heard delightful stories of "jobs" and "schemes" and had hoped to hear more. When they had been taken to the visitors' gallery, they had exhibited an earnest anxiety to be shown the members connected with the last Investigation, and had received with private rapture all anecdotes connected with the ruling political scandal. They decided that the country was in a bad way, and felt a glow of honest pride in its standing up at all in its present condition of rottenness. Their ardor had been a little dampened by an incautious statement made by their friend and guide, to the effect that the subject of the Investigation seemed likely to clear himself of the charges made against him, and the appearance of Richard Amory, with his personal attractions, his neat equipage, and his air of belonging to the great world, was something of a boon to them. They wished his wife had been with him; they had only seen one female lobbyist as yet, and she had been merely a cheap, flashy woman, with thin, rouged cheeks and sharp, eager eyes.

"Looks rather anxious, doesn't he?" one asked the other, as Amory went by. He certainly looked anxious as he passed them; but, once inside the building, he made an

effort to assume something of his usual air of gay good cheer. It would not do to present himself with other than a fearless front. So he walked with a firm and buoyant tread through the great vaulted corridors and up the marble stairways, exchanging a salutation with one passer-by and a word of greeting with another. He found Senator Blundel in his committee-room, sitting at the green-covered table, looking over some papers. He was a short, stout man, with a blunt-featured face, grayish hair, which had a tendency to stand on end, and small, shrewd eyes. When he had been in the House, his rising to his feet had generally been the signal for his fellow-members to bestir themselves and turn to listen, as it was his habit to display a sharp humor of a rough-and-ready sort. Richard had always felt this humor coarse, and having but little confidence in Blundel's possessing any other qualification for his position, regarded it as rather trying that circumstances should have combined to render his sentiments of such importance in the present crisis. Looking at the thick-set figure and ordinary face, he felt that Planefteld had been right, and that Bertha might have done much with him, principally because he presented himself as one of the obstacles whose opinions should be formed for them all the more on account of their obstinacy when once biased in a wrong direction.

But there was no suggestion of these convictions in his manner when he spoke. It was very graceful and ready, and his strong points of good-breeding and mental agility stood him in good stead. The man before him, whose early social advantages had not been great, was not too dull to feel the influence of the first quality and find himself placed at a secretly acknowledged disadvantage by it. After he had heard his name, his small, sharp eyes fixed themselves on his visitor's handsome countenance, with an expression not easy to read.

"It is not necessary for me to make a new statement of our case," said Richard easily. "I won't fatigue you and occupy your time by repeating what you have already heard stated in the clearest possible manner by Senator Planefteld."

Blundel thrust his hands into his pockets and nodded.

"Yes," he responded. "I saw Planefteld, and he said a good deal about it."

"Which, of course, you have reflected upon?" said Richard.

"Well, yes. I've thought it over—along with other things."

"I trust favorably!" Richard suggested.

Blundel stretched his legs a little and

pushed his hands farther down into his pockets.

"Now, what would you call favorably?" he inquired.

"Oh!" replied Richard, with self-possessed promptness, "favorably to the connecting branch."

It was a rather fine stroke, this airy candor, but he had studied it beforehand thoroughly and calculated its effect. It surprised Blundel into looking up at him quickly.

"You would, eh?" he said, "let us hear why."

"Because," Richard stated, "that would make it favorable to us."

Blundel was beguiled into a somewhat uneasy laugh.

"Well," he remarked, "you're frank enough."

Richard fixed upon him an open, appreciative glance.

"And why not?" he answered. "There is our strong point—that we can afford to be frank. We have nothing to conceal. We have something to gain, of course—who has not?—but it is to be gained legitimately—so there is no necessity for our concealing that. The case is simplicity itself. Here are the two railroads. See," and he laid two strips of paper side by side upon the table. "A connecting branch is needed. If it runs through this way," making a line with his finger, "it makes certain valuable lands immeasurably more valuable. There is no practical objection to its taking this direction instead of that—in either case it runs through the Government reservations,—the road will be built,—somebody's property will be benefited. Why not that of my clients?"

Blundel looked at the strips of paper, and his little eyes twinkled mysteriously.

"By George!" he said, "that isn't the way such things are generally put. What you ought to do is to prove that nobody is to be benefited, and that you're working for the good of the Government."

Richard laughed.

"Oh!" he said, "I am an amateur, and I should be of no use whatever to my clients if they had anything to hide or any special reason to fear failure. We have opposition to contend with, of course. The southern line is naturally against us, as it wants the connecting branch to run in the opposite direction; but if it has no stronger claim than we have, the struggle is equal. They are open to the objection of being benefited by the subsidies, too. It is scarcely ground enough for refusing your vote—that some one will be benefited by it. The people is the Government in America, and the Government the people, and

the interest of both are too indissolubly connected to admit of being easily separated on public measures. As I said, I am an amateur, but I am a man of the world. My basis is a natural, human one. I desire to attain an object, and though the Government will be benefited, I am obliged to confess I am arguing for my object more than for the Government."

This was said with more delightful, airy frankness than ever. But, concealed beneath this genial openness was a desperate anxiety to discover what his companion was thinking of, and if the effect of his stroke was what he had hoped it would be. He knew that frankness so complete was a novelty, and he trusted that his bearing had placed him out of the list of ordinary applicants for favor. His private conviction, to which he did not choose to allow himself to refer mentally with any degree of openness, was that, if the man was honest, honesty so bold and simple must disarm him; and, if he was not, ingenuousness so reckless must offer him inducements. But it was not easy to arrive at once at any decision as to the tenor of Blundel's thoughts. He had listened, and it being his habit to see the humor of things, he had grinned a little at the humor he saw in this situation, which was perhaps not a bad omen, though he showed no disposition to commit himself on the spot.

"Makes a good story," he said; "pretty big scheme, isn't it?"

"Not a small one," answered Richard, freely. "That is one of its merits."

"The subsidies won't have to be small ones," said Blundel. "That isn't one of its merits. Now, let us hear your inducements?"

Richard checked himself on the very verge of a start, realizing instantaneously the folly of his first flashing thought.

"The inducements you can offer to the Government," added Blundel. "You haven't gone into a thing of this sort without feeling you have some on hand."

Of course there were inducements, and Richard had them at his fingers' ends, and was very fluent and eloquent in his statement of them. In fact, when once fairly launched upon the subject, he was somewhat surprised to find how many powerful reasons there were for its being to the interest of the nation that the land grants should be made to the road which ran through the Westoria lands and opened up their resources. His argument became so brilliant, as he proceeded, that he was moved by their sincerity himself, and gained impetus through his confidence in them. He really felt that he was swayed by a generous desire to benefit his

country, and enjoyed his conviction of his own honesty with a refinement which, for the moment, lost sight of all less agreeable features of the proceeding. All his fine points came out under the glow of his enthusiasm,—his grace of speech and manner, his picturesque habit of thought, which gave color and vividness to all he said,—his personal attractiveness itself.

Blundel bestirred himself to sit up and look at him with a new interest. He liked a good talker; he was a good talker himself. His mind was of a practical business stamp, and he was good at a knock-down blow in argument, or at a joke or jibe which felled a man like a meat-ax; but he had nothing like this, and he felt something like envy of all this swiftness and readiness and polish.

When he finished, Richard felt that he must have impressed him; that it was impossible that it should be otherwise, even though there were no special external signs of Blundel being greatly affected. He had thrust his hands into his pockets as before, and his hair stood on end as obstinately.

"Well," he said, succinctly, "it is a good story and it's a big scheme."

"And you ——?" said Richard. "We are sure of you ——"

Blundel took a hand out of his pocket and ran it over his upright hair, as if in a futile attempt at sweeping it down.

"I'll tell you what I'll do," he said. "I'll see you day after to-morrow."

"But ——" exclaimed Richard, secretly agast.

Blundel ran over his hair again and returned his hand to his pocket.

"Oh, yes!" he answered. "I know all about that. You don't want to lose time, and you want to feel sure; but, you see, I want to feel sure, too. As I said, it's a big business; it's too big a business to assume the responsibility of all at once. I'm not going to run any risks. I don't say you want me to run any; but, you know, you are an amateur, and there may be risks you don't realize. I'll see you again."

In his character of amateur, it was impossible for Richard to be importunate, but his temptations to commit the indiscretion were strong. A hundred things might happen in the course of two days; delay was more dangerous than anything else. The worst of it all was that he had really gained no reliable knowledge of the man himself and of how it would be best to approach him. He had seen him throughout the interview just as he had seen him before it. Whether or not his sharpness was cunning and his bluntness a defense, he had not been able to decide.

"At any rate, he is cautious," he thought. "*How* cautious it is for us to find out."

When he left him, Richard was in a fever of disappointment and perplexity, which, to his ease and pleasure-loving nature, was torment.

"Confound it all!" he said. "Confound the thing from beginning to end! It will have to pay well to pay for this."

He had other work before him, other efforts to make, and, after he had made them he returned to his carriage fatigued and overwrought. He had walked through the great corridors, from wing to wing, in pursuit of men who seemed to elude him like will-o'-the-wisps; he had been driven to standing among motley groups, who sent in cards which did not always intercede for them; he had had interviews with men who were outwardly suave and pliable, with men who were ill-mannered and impatient, with men who were obstinate and distrustful, and with men who were too much occupied with their own affairs to be other than openly indifferent; if he had met with a shade of encouragement at one point, he had found it amply balanced by discouragement at the next; he had seen himself regarded as an applicant for favor, and a person to be disposed of as speedily as possible, and, when his work was at an end, his physical condition was one of exhaustion, and his mental attitude marked chiefly by disgust and weariness of spirit.

This being the state of affairs, he made a call upon Miss Varien, who always exhilarated and entertained him.

He found her in her bower, and was received with the unvarying tact which characterized her manner upon all occasions. He poured forth his woes, as far as they could be told, and was very picturesque about them as he reclined in the easiest of easy-chairs.

"It is my opinion that nothing can be done without money," he said, "which is disgraceful!"

"It is, indeed," acknowledged Miss Varien, with a gleam of beautiful little teeth.

She had lived in Washington with her exceptional father and entirely satisfactory mother from her earliest infancy, and had gained from observation—at which she was brilliant, as at all else—a fund of valuable information. She had seen many things, and had not seen them in vain. It may even be suspected that Richard, in his character of amateur, was aware of this. There was a suggestion of watchfulness in his glance at her.

"Things ought to be better or worse to simplify the system," she said.

"That is in effect what I heard said this morning," answered Richard.

"I am sorry it is not entirely new," she returned. "Was it suggested, also, that since we cannot have incorruptibility we might alter our moral standards and remove corruption by making all transactions mere matters of business? If there was no longer any penalty attached to the sale and barter of public privileges, such sale and barter would cease to be dishonor and crime. We should be better if we were infinitely worse. The theory may appear bold at first blush—no, not at first blush, for blushes are to be done away with—at first sight, I will say in preference; it may appear bold, but after much reflection I have decided that it is the only practicable one."

"It is undoubtedly brilliant," replied Richard; "but, as you say it would simplify matters wonderfully, I should not be at such a loss to know what Senator Blundel will do, for instance, and my appetite for lunch would be better."

"It might possibly be worse," suggested Miss Varien.

Richard glanced at her quickly.

"That is a remark which evidently has a foundation," he said. "I wish you would tell me what prompted it."

"I am not sure it was very discreet," was the reply. "My personal knowledge of Senator Blundel prompted it."

"You know him very well," said Richard, with some eagerness.

"I should not venture to say I knew any one very well," she said, in the captivating voice which gave to all her words such value and suggestiveness. "I know him as I know many other men like him. I was born a politician, and existence without my politics would be an arid desert to me. I have talked to him and read his speeches, and followed him in his career for some time. I have even asked questions about him, and, consequently, I know something of his methods. I *think*—you see, I only say I think—I know what he will do."

"In Heaven's name, what is it?" demanded Richard.

She unfurled her fan and smiled over it with that delightful gleam of little white teeth.

"He will take his time," she answered. "He is slow, and prides himself on being sure. Your bill will not be acted upon, it will be set aside to lie over until the next session of Congress."

Richard felt as if he changed color, but he bore himself with outward discretion.

"You have some ulterior motive," he said. "Having invited me to remain to luncheon you seek to render me incapable of doing myself justice. You saw in my eye the wolf—"

ish hunger which is the result of interviews with the savage senator and the pitiless member of Congress. Now I see the value of your theory. If it were in practice, I could win Blundel over with gold. What is your opinion of his conscience as it stands?"

It was said with admirable lightness and answered in a like strain, but he had never been more anxiously on the alert than he was as he watched Miss Varien's vivacious and subtly expressive face.

"I have not reached it yet," she said. "And

consciences are of such different make and material; I have not decided whether his is made of interest or honesty. He is a mixture of shrewdness and crudeness which is very baffling; just when you are arguing from the shrewdness the crudeness displays itself, and *vice versâ*. But, as I said, I *think* your bill will not be acted upon."

And then they went in to lunch, and, as he ate his lobster-salad and made himself agreeable beyond measure, Richard wondered, with an inward tremor, if she could be right.

(To be continued.)

## INDIAN SUMMER.

### I.

AFTER October's biting frosts it seems

That summer days return. The partridge whirs  
A noisy wing to ambush in the firs;  
And for a while the sun retricks his beams.  
It is an autumn that of spring-time dreams.

The warm breeze comes again, and softly stirs  
The silent tree-tops, and the empty burs  
Which, loosened, drop into the leaf-clogged streams.  
Ah! dear, this tardy sunshine, and the last!  
So we shall find—our summer being past,  
And hoar-frost with us—for a little breath  
So fair a country, such a genial air;  
And shall forget our woes, and unaware  
Step over to the border-land of Death!

*Andrew B. Saxton.*

### II.

What heights of rest are in these silences!  
What thirst of plains the sunlight seems to slake!  
The meadows bask. No bitter north-winds wake  
The tree-tops from their fruitless dream of ease.  
The slow brooks murmur like a swarm of bees,  
And some shy creature in the tangled brake  
Darts and is still, and trooping sparrows make  
A moment's chatter in the cedar-trees.  
Then on far skies they quickly seem to cease,  
Or, wheeling, drop behind some stubbled mound;  
But all day long the brooks find no release,  
And lift their wandering undertones of sound.  
This is the year's full flower, the crown of peace,  
The sunlight's harvest, and the south-wind's bound.

*L. Frank Tooker.*

## HARD FARE.

SUCH a winter as was that of 1880-81—deep snows and zero weather for nearly three months—proves especially trying to the wild creatures that attempt to face it. The supply of fat (or fuel) with which their bodies become stored in the fall is rapidly exhausted by the severe and uninterrupted cold, and the sources from which fresh supplies are usually obtained are all but wiped out. Even the fox was very hard pressed and reduced to the unusual straits of eating frozen apples; the pressure of hunger must be great, indeed, to compel Reynard to take up with such a diet. A dog will eat corn, but he cannot digest it, and I doubt if the fox extracted anything more than the cider from the frozen and thawed apples. They perhaps served to amuse and occupy his stomach for the time. The crows appeared to have little else than frozen apples for many weeks; they hung about the orchards as a last resort, and, after scouring the desolate landscape over, would return to their cider with resignation, but not with cheerful alacrity. They grew very bold at times, and ventured quite under my porch, and filched the bones that Lark, the dog, had left. I put out some corn on the wall near by, and discovered that crows will not eat corn in the winter, except as they can break up the kernels. It is too hard for their gizzards to grind. The difficulty, during such a season, of coming at the soil and obtaining gravel-stones, which, in such cases, are really the mill-stones, may also have something to do with it. Corn that has been planted and has sprouted, crows will swallow readily enough, because it is then soft, and is easily ground. My impression has always been that in spring and summer they will also pick up any chance kernels the planters may have dropped. But, as I observed them the past winter, they always held the kernel under one foot upon the wall, and picked it to pieces before devouring it. This is the manner of the jays also. The jays, perhaps, had a tougher time during the winter than the crows, because they do not eat fish or flesh, but depend mainly upon nuts. A troop of them came eagerly to my ash-heap one morning, which had just been uncovered by the thaw, but they found little except cinders for their gizzards, which, maybe, was what they wanted. They had foraged nearly all winter upon my neighbor's corn-crib, and probably their mill-stones were dull and needed re-

placing. They reached the corn through the opening between the slats, and were the envy of the crows, who watched them from the near trees, but dared not venture up.

The general belief among country-people that the jay hoards up nuts for winter use has probably some foundation in fact, though one is at a loss to know where he could place his stores so that they would not be pilfered by the mice and the squirrels. An old hunter told me he had seen jays secreting beech-nuts in a knot-hole in a tree. Probably a red squirrel saw them too, and laughed behind his tail. One day, in October, two friends of mine, out hunting, saw a blue jay carrying off chestnuts to a spruce swamp. He came and went with great secrecy and dispatch. He had several hundred yards to fly each way, but occupied only a few minutes each trip. The hunters lay in wait to shoot him, but so quickly would he seize his chestnut and be off, that he made more than a dozen trips before they killed him. It is a great pity they did not follow him to the swamp and discover where he deposited his booty, and how much he had accumulated.

A lady writing to me from Iowa, says: "I must tell you what I saw a blue jay do last winter. Flying down to the ground in front of the house, he put something in the dead grass, drawing the grass over it, first on one side, then on the other, tramped it down just exactly as a squirrel would, then walked around the spot, examining it to see if it was satisfactory. After he had flown away, I went out to see what he had hidden; it was a nicely shucked peanut that he had laid up for a time of scarcity."

It would seem, therefore, that the jay has the habit of all the crow-tribe, of carrying off and secreting any surplus food it may chance to have, and it is not improbable that these hoardings sometimes help it over the period of winter scarcity.

A bevy of quail in my vicinity got through the winter by feeding upon the little black beans contained in the pods of the common locust. For many weeks their diet must have been almost entirely leguminous. The surface snow in the locust-grove which they frequented was crossed in every direction with their fine tracks, like a chain-stitch upon muslin, showing where they went from pod to pod and extracted the contents. Where quite a large branch, filled with pods, lay upon the snow, it

looked as if the whole flock had dined or breakfasted off it. The wind seemed to shake down the pods about as fast as they were needed. When a fresh fall of snow had blotted out everything, it was not many hours before the wind had placed upon the cloth another course; but it was always the same old course—beans, beans. What would the birds and the fowls do during such winters, if the trees and the shrubs and plants all dropped their fruit and their seeds in the fall, as they do their leaves? They would nearly all perish. The apples that cling to the trees, the pods that hang to the lowest branches, and the seeds that the various weeds and grasses hold above the deepest snows, alone make it possible for many birds to pass the winter among us. The red squirrel, too, what would he do? He lays up no stores like the provident chipmunk, but scours about for food in all weathers, feeding upon the seeds in the cones of the hemlock that still cling to the tree, upon sumac-bobs, and the seeds of frozen apples. I have seen the ground, under a wild apple-tree that stood near the woods, completely covered with the "chonkings" of the frozen apples, the work of the squirrels in getting at the seeds; not an apple had been left, and, apparently, not a seed had been lost. But the squirrels in this particular locality evidently got pretty hard up before spring, for they developed a new source of food-supply. A young bushy-topped sugar-maple, about forty feet high, standing beside a stone fence near the woods, was attacked, and more than half denuded of its bark. The object of the squirrels seemed to be to get at the soft, white, mucilaginous substance (cambium layer) between the bark and the wood. The ground was covered with fragments of the bark, and the white, naked stems and branches had been scraped by fine teeth. When the sap starts in the early spring, the squirrels add this to their scanty supplies. They perforate the bark of the branches of the maples with their chisel-like teeth, and suck the sweet liquid as it slowly oozes out. It is not much as food, but evidently it helps.

I have said the red squirrel does not lay by a store of food for winter use, like the chipmunk and wood-mice; yet in the fall he sometimes hoards in a tentative, temporary kind of way. I have seen his savings—butternuts and black walnuts—stuck here and there in saplings and trees, near his nest; sometimes carefully inserted in the upright fork of a limb, or twig. One day, late in November, I counted a dozen or more black walnuts put away in this manner in a little grove of locusts, chestnuts, and maples, by the road-side, and could but smile at the wise

forethought of the rascally squirrel. His supplies were probably safer that way than if more elaborately hidden. They were well distributed; his eggs were not all in one basket, and he could go away from home without any fear that his store-house would be broken into in his absence. The next week, when I passed that way, the nuts were all gone but two. I saw the squirrel that doubtless laid claim to them, on each occasion.

There is one thing the red squirrel knows unerringly that I do not (there are probably several other things), that is, on which side of the butternut the meat lies. He always gnaws through the shell so as to strike the kernel broadside and thus easily extract it, while to my eyes there is no external mark or indication, in the form or appearance of the nut, as there is in the hickory-nut, by which I can tell whether the edge or the side of the meat is toward me. But, examine any number of nuts that the squirrels have rifled, and you will find they always drill through the shell at the one spot where the meat will be most exposed. It stands them in hand to know, and they do know. Doubtless, if butternuts were a main source of my food, and I were compelled to gnaw into them, I should learn, too, on which side my bread was buttered.

A hard winter affects the chipmunks very little; they are snug and warm in their burrows in the ground and under the rocks, with a bountiful store of nuts or grain. I have heard of nearly a half-bushel of chestnuts being taken from a single den. They usually hole in November, and do not come out again till March or April, unless the winter is very open and mild.

The woodpeckers and chickadees, doubtless, find food as plentiful during severe winters as during more open ones, because they confine their search almost entirely to the trunks and branches of trees, where the latter pick up the eggs of insects and various microscopic tidbits, and where the former find their accustomed fare of eggs and larvæ also. An enamel of ice upon the trees alone puts an embargo upon their supplies. At such seasons the ruffed grouse "buds" or goes hungry; while the snow-birds, snow-bunting, Canada sparrows, goldfinches, shore-larks, and red-polls are dependent upon the weeds and grasses that rise above the snow, and upon the litter of the hay-stack and barn-yard. I have never seen the shore-lark in my locality, and only one season the red-poll; but the former bird has been common the past winter in other parts of New York State. Neither do the deep snows and the severe cold materially affect the supplies of the rabbit. The deeper

the snow the nearer he is brought to the tops of the tender bushes and shoots. I see in my walks where he has cropped the tops of the small, bushy, soft maples, cutting them slantingly as you would do with a knife, and quite as smoothly. Indeed, the mark was so like that of a knife that, notwithstanding the tracks, it was only after the closest scrutiny that I was convinced it was the sharp, chisel-like teeth of the rabbit. He leaves no chips, and apparently makes clean work of every twig he cuts off.

The wild or native mice usually lay up stores in the fall, in the shape of various nuts, grain, and seeds, and the frost and the snow-blockade seem to interfere very little with their enjoyment of life. One may see their tracks everywhere in the woods and fields, and by the road-side. Why they gad about so much, having a full larder and a warm nest at home, is a mystery. Doubtless the motive is sociability and the delights of travel. The deer-mouse is much more common along the fences and in the woods than one would suspect. One winter day I set a mouse-trap—the kind known as the delusion trap—beneath some ledges in the edge of the woods, to determine what species of mouse was most active at this season. The snow fell so deeply that I did not visit my trap for two or three weeks. When I did so, it was literally packed full of deer-mice. There were seven in all, and not room for another. Our woods are full of these little creatures, and they appear to have a happy, social time of it, even in the severest winters. Their little tunnels under the snow and their hurried strides upon its surface may be noted everywhere. They link tree and stump, or rock and tree, by their pretty trails. They are not traveling in quest of food,—for they generally have a well-filled granary or nuttery at home,—but evidently for adventure and to hear the news. They know that foxes and owls are about, and they keep pretty close to cover. When they cross an exposed place, they do it hurriedly.

Such a winter as that of 1880-81 probably destroys a great many of our half-migratory birds. The mortality appears to be the greatest in the Border States, where so many species, like the sparrows, robins, blue-birds, meadow-larks, kinglet, etc., usually pass the cold season. A great many birds are said to have

died in New Jersey and Pennsylvania, including game-birds. A man in Chester County saw a fox digging in the snow; on examining the spot, he found half a dozen quails frozen to death. Game-birds and nearly all other birds will stand the severest weather if food is plenty; but to hunger and cold both the hardest species may succumb.

Meadow-larks often pass the winter as far north as Pennsylvania. A man residing in that State relates how, in the height of the severest cold, three half-famished larks came to his door in quest of food. He removed the snow from a small space, and spread the poor birds a lunch of various grains and seeds. They ate heartily and returned again the next day, and the next, each time bringing one or more drooping and half-starved companions with them, till there was quite a flock of them. Their deportment changed, their forms became erect and glossy, and the feeble mendicants became strong and vivacious birds again. These larks fell in good hands, but I am persuaded that this species suffered more than any other of our birds the past winter. In the spring they were unusually late in making their appearance,—the first one noted by me on the 9th of April,—and they were scarce in my locality during the whole season.

Birds not of a feather flock together in winter. Hard times or a common misfortune makes all the world akin. A Noah's ark with antagonistic species living in harmony is not an improbable circumstance in such a rain. In severe weather, when the snow lies deep on the ground, I frequently see a loose, heterogeneous troop of birds pass my door, engaged in the common search for food; snow-birds, Canada sparrows, and goldfinches, on the ground, and kinglets and nut-hatches in the tree above,—all drifting slowly in the same direction,—the snow-birds and sparrows closely associated, but the goldfinches rather clannish and exclusive, while the kinglets and nut-hatches keep still more aloof. These birds are probably not drawn, even thus loosely together, by any social instincts, but by a common want; all were hungry, and the activity of one species attracted and drew after it another and another. "I will look that way too," the kinglet and creeper probably said, when they saw the other birds busy and heard their merry voices.

*John Burroughs.*

## TOPICS OF THE TIME.

### Western Careers for Eastern Young Men.

EDITOR OF THE CENTURY MAGAZINE.

DEAR SIR: Why the young men who in the East are crowding by thousands into the professions and mercantile pursuits which are already so full, don't come out West and tackle farming or stock-raising, I cannot, for the life of me, see; and I'm sure that if the matter was properly placed before them, they would whistle at the pursuits named and come out to the free and independent life of the Western farmer and stock-raiser with an enthusiasm which would insure success. I don't know why college-bred men seem to have a low opinion of agricultural life. Perhaps it is because they get their ideas of what it is from the hard-worked farmer of the East, certainly not from his brother of the West, whose life, if he is at all forehanded, is the easiest and most independent in the world.

Why don't the fathers in the East, who, after having expensively educated their sons, spend additional thousands in setting them up in business or starting them in a profession, give the boys a few hundred dollars (the more the better) and send them West to become farmers or stock-raisers? They can soon make themselves independent; and then the law, medicine, banking, or any other pursuit, is open to them. The policy which keeps them at the East in a long and expensive probation is silly; out West they can become self-supporting, and therefore proportionately more manly and self-reliant from the beginning. It costs but a trifle in money to take up a quarter-section of land and put up a comfortable shed in which to live, and buy the necessary tools and stock to work with; after which, cheerful work does the rest. No especial knowledge of husbandry is required at the start that cannot be acquired by a few questions, which any one will cheerfully answer, and if the beginner does make mistakes they are not costly ones.

Young England seems to see this question in a proper light, for there is in this State, at Le Mars, a very large colony of young men from England—mostly college-bred—who are making successful farmers and stock-raisers; I cannot give any details, but can only say that there are some six hundred or more of them, and that they look successful, contented, and happy. They certainly are healthy, as any one would be sure to be, leading the life they do. They work hard, but they have their play with it, as the great number of greyhounds and sporting dogs of all kinds seen in that section, as well as the spring, summer and fall meetings of the Le Mars race-course—where they enter and ride their own ponies and horses—will abundantly testify.

Why should not the young men of Harvard, Yale, Princeton, Columbia, and the other colleges of the East, organize colonies in the West, and, while making homes and careers for themselves, assist in building up this new country?

Yours truly,

NEWTON, IOWA.

W. B. D.

The suggestion of our correspondent is not very novel. We are quite sure that we have heard this kind of advice before,—notably in the days of Mr. Greeley. In fact, there have been times when this

advice, being put forth by some as a sort of social panacea, suffered the ignominious fate of all panaceas. Just now, however, there is a renewal of the Western furore, and our correspondent naturally wants to see educated young men follow the example of some recent English educated colonists. A great many of our young men of education are undoubtedly taking part in the movement, though not in groups like the English, perhaps, and we dare say there are many more who would be wise to follow.

According to a recent report from the General Land Office in Washington, the United States disposed of 15,699,848 acres of public lands during the year ending June 30, 1882. Of this vast area nearly one-half, or 6,347,729 acres, were taken by settlers under the provisions of the Homestead Act,—more than one-third of the Homestead entries being in Dakota. The Western migration of 1881 was regarded as phenomenal, but it has probably been exceeded in volume by that of the season just closed. It is hardly an exaggerated estimate to say that a million of people have transferred themselves, during the past eight months, from the Atlantic seaboard States and the older States of the Mississippi Valley, and from the perennially swarming hive of Europe, to the prairies of Dakota, Nebraska, Kansas, and Texas, the valleys of the Rocky Mountain system, and to the farther regions of the Pacific slope. So rapidly have the vacant spaces in the center of the continent and on its western shore filled up in recent years, that there is no longer a frontier. Even in the least accessible and least attractive regions some sprinkling of population is found, and there are few sections where one could now travel a hundred miles without coming upon the habitations of civilized men.

The young man in the older communities of the East, reading of the marvelous growth of this new western country, often asks himself whether he could not wisely join the ranks of the next annual migration. No doubt the question, "Shall I go West?" is the uppermost problem in the minds of thousands of the young men of the East, who have still their careers to make, and have not yet gained a secure and promising footing in the business world. It is a question which each must answer for himself, and concerning which no advice can be given that would be of universal application. It would be a grievous mistake to suppose that a change of longitude alone insures success. Idleness, incompetency, and a nerveless, drifting disposition, have no better chance in Montana than in Massachusetts. Indeed, there are some men who run along fairly well in the East, in the grooves of custom and of established acquaintance and business connections, who would make lamentable shipwreck if set adrift in a new Western community.

On the other hand, the chances for a young man of average pluck and energy are unquestionably much better in the West than in the East. He shares the advantages of being among the first to open a fresh

store-house of natural wealth. He gets the first dividend on the increase of value resulting from bringing population upon the soil. The land he buys for three or four dollars an acre, or gets for nothing by homestead settlement, soon becomes worth ten or fifteen. If he embarks in trade or in any mechanical pursuit, his wares or his services are in brisk demand, because all the new-comers around him require goods and implements. Then there is a certain stimulus in the moral atmosphere caused by the ambitions and energies of a new community full of hope and activity, which makes hardships easy to bear and causes buoyancy of spirits.

Western people find it hard to make their friends in the East understand just what they mean when they speak of the difference in the business and social tone of the two sections. It is a difference to be felt rather than defined. There is vastly more energy and more hope *per capita* of the population in new communities than old, and the immigrant feels at once the resulting stimulus. It braces up the listless and the desponding, and makes even the most active man conclude that there is a deal more in him in the way of work and ideas than he supposed. Many a young man who would have remained a clerk or small-salaried employee of some kind all his life, had he stayed in the East, becomes, amid the larger opportunities of the West, a "leading citizen," and the owner of a fine farm or a prosperous business.

The young man going West can, therefore, count upon the opportunities of obtaining good land at small cost, the business openings growing out of the wants of a new community, and the moral incentive that comes from contact with hopeful, enterprising people. If he does not succeed in gaining a full measure of independence in the course of ten years, the reason will lie in his own disposition. He will either lack energy and capacity, or he will be so much a creature of habit and so thoroughly the outgrowth of an older civilization that he cannot adjust himself to the new environments. There are men, as well as trees, that will not thrive when transplanted. The intending emigrant would do well to study his own disposition carefully, and make sure that he is not of that kind.

Finally, the Western emigrant must expect to miss many of the agreeable conditions of life in his own home: to work hard and live plainly, to get along without a hundred comforts and pleasures which have been almost as much a matter of course to him as his three meals a day. He will have to find his enjoyments, for a few years, largely in anticipating the rewards which the future is to bring. He will not have to endure the rude physical hardships suffered by the last generation of pioneers who cleared the forests of Ohio and Indiana, for the railroads now go in advance of settlement, and bring the appliances of comfortable living to those who can pay for them. He can ride on a sulky-plow, sow his grain with a patent drill, reap it with a harvester, and thresh it with swift machinery driven by a straw-burning steam-engine; but, for all that, there are many deprivations to be borne, and trials enough to be endured to test his manly qualities. A feeling that he is building up the country and his own fortunes at the same time will bring him safely through them all, however, if he has the stuff in him for a successful pioneer.

#### The Late Dr. Pusey.

THE death of Dr. Pusey has already drawn from his countrymen, of all theological opinions, an expression of admiration for his character, which, in many quarters, was withheld while his living presence lent a luster to the ritualistic movement which claimed him as one of its fathers. For a moment, at least, his character has become a center of unity in the English Church. The partisanship of religious ideas gives way before the fact of a good life appealing through death to the judgment of the universal moral sense which never refuses its homage to actual righteousness. The unanimity with which opposite Church parties are now pointing to Dr. Pusey's sincerity, courage, singleness of purpose, fairness, gentleness, and practical religion, in which all see the Christian ideal almost realized, ought to admonish theological antagonists that the real issues of spiritual life move far away from their disputes. In England, however, this universal desire to express admiration for his character may delay, for a time, any real estimate of his mental powers. His warmest admirers will soon have to admit that his intellect was inferior to his spirit. Keble in his poetry, and Newman in his exquisitely disguised logic, showed greater ability, and perhaps both did more to enforce "Puseyism" than did Pusey himself. Pusey was not the first reformer whose mind was unable to take large views of really great things. The great ideas of catholicity and spiritual life, when revived by the High Church movement of fifty years ago, found in him a narrow, though intense, expositor. He seemed incapable of conceiving of that true catholicity which includes in the kingdom of God every one faithful to Divine truth, as revealed in every age. For him, "Catholic truth" spoke its last word from the lips of the Church Fathers of the first few centuries. He was among the first to recognize and denounce the deadening provincialism of the Established Church of England; but he sought to escape from it, not, like the poetic Keble, by rising into the ideal aspect of its doctrines and worship, nor, like the courageous Newman, by entering the historic repose of the Roman Catholic communion; but like a practical Englishman, by emigrating to the earliest centuries of Christianity. Amidst the contradictory voices of that troubled epoch, his intellectual narrowness enabled him to hear only the few which happened to be in agreement with one another, and to gather from their somewhat thin harmony that principle of "Catholic authority" which led him to ignore all truth revealed ever since. While men like Dean Stanley rejoiced to hear the voice of God in every age, — a living voice appealing to the living soul through every event in history and in individual experience, — Pusey's faith in divine illumination shrank up into an exclusive attention to the partial truths spoken in the Church's prattling days. To men like Maurice, the formulated doctrines of Christianity were but openings into principles and truths in harmony with the universe itself, and, therefore, too large to find complete expression in any dogma; Pusey regarded Christian doctrines as final verities relating only to a supernatural life and deposited in the Primitive Church, to be guarded by a perpetual succession in the ministry. The true historic spirit which, to so many

earnest minds to-day, supplies the best commentary upon Christian doctrines, seemed to Pusey the bitterest enemy of the faith. The fact is, he was unaware of any divine movement in his own times apart from the "Tractarian" agitation which enlisted his whole life; and perhaps, no other church leader has ever left a mass of writing in which there is such a manifest ignorance of the special light and truth revealed in his own generation.

The depth and reality of Dr. Pusey's own spiritual life are beyond doubt. His intense appeals to his followers to seek holiness of life evidently come from depths of personal realization. At the same time, in common with the teaching of the whole Anglo-Catholic party, he leaves the impression that holiness is not the perfecting of human nature *as such*, but rather the training of the soul in special and peculiar exercises to fit it for Heaven. The conception of spirituality, as a pervading sense of the Divine Presence everywhere and in everything, giving tone to the inmost thoughts and character to the outmost acts, was incomprehensible to him. He seemed to see in God a reluctance to approach man, except through certain prescribed transactions in church and at the altar; and he enforces the necessity of such spiritual acts, as though they were signals of distress to attract the help of a remote and inattentive Providence, rather than as grateful expressions of our sense of His perpetual nearness. Indeed, much of the attractiveness of the extreme High Church view of religion lies in its notion that, in specified times and acts, man can work effects in deity itself. There will probably always exist two contrasted aspects of religion: that which regards the whole world as the family of God, in which spiritual life means the consciousness of the family tie drawing men out of self-hood into brotherhood toward all on earth, and into an aspiring sympathy with all in heaven; and that other view which regards the world as a wreck, and spiritual life as the difficult process of being rescued from it. Men like Dr. Arnold, Maurice, Stanley, and Robertson represented the first view; Pusey and his followers represented the second. The High Church movement has lost much of the intensity which fired the early Puseyites with the idea of rescue, and in its present ritualistic phase has degenerated into that externalization of religion which makes worship an almost physical satisfaction to the modern ritualist. This, indeed, was the sorrow of the great leader's old age—and more than once he lifted his voice against such a misapprehension of his teaching. He was too spiritually great to associate any æsthetic or mediæval whim with the tremendous task of saving souls; and we may say that it was the true greatness of his spiritual purpose which, in spite of his narrow view of catholicity and his one-sided view of personal religion, quickened the spiritual life of the English Church, when it seemed so dead that nothing but the intense call of vehemently earnest men could arouse it. Many other voices helped to work that miracle; but Dr. Pusey's, although not the strongest nor the sweetest, had just the tone to reach the deadened English ear. The church which he helped to arouse needs minds of a different order to guide her energies to enlightened issues, under the inspiration of a wider horizon than Pusey's intellect could discern; but, after all, the most enlightened

church of the future can have no nobler ambition than to multiply *characters* like his. His ecclesiastical and theological views were provincialism itself usurping the tones of catholicity; but his spirit and life witnessed for those universal verities of practical righteousness, which constitute the true catholicity of all earnest and enlightened men.

#### The Archæological Institute of America.

THANKS to the initiative of a number of public-spirited gentlemen of Boston and Cambridge, and the aid of others in many parts of the United States, the Archæological Institute may be said to make promising efforts to fly, if, indeed, it cannot be held to be fully fledged. It is not strong enough to publish all its own reports. The Harvard Art Club and Philological Society have paid the cost of the elaborate *prolegomena* on the ruins of Assos, Asia Minor, forwarded by Mr. Joseph Thacher Clarke and his assistants, and the Third Annual Report of the Executive Committee holds an appeal to the liberal for contributions toward a more thorough and comprehensive sifting of the Assos ruins by the same able excavator. It is true that much is said, in forcible language, of the need of work in archæology strictly American. Therein the last report differs favorably from that presented in May, 1880, when the desirability of working the site of Greek settlements led the committee to make unnecessary capital out of certain facts regarding American archæology. The latter, we were told, relates "to the monuments of a race that never attained to a high degree of civilization, and that has left no trustworthy records of continuous history. It was a race whose intelligence was, for the most part, of a low order; whose sentiments and emotions were confined within a narrow range, and whose imagination was never quickened to find expression for itself in poetic or artistic forms of beauty." Not content with this partial and misleading statement, the committee added, entirely untruly: "From what it was, or what it did, nothing is to be learned that has any direct bearing on the progress of civilization." This mistaken zeal appears to have sprung from an undue prominence in the minds of the committee of classical studies. They forgot, or chose to forget, the claims of ethnology. They appear to have been blind to the fact that, notwithstanding the greatness of the Greeks in all departments of thought, there is a large way of looking at archæology, namely, as a study of the appearance of man on the globe through the traces he has left behind him, in which study the Greeks can only take their place as one, though a highly important, race. Without wishing to disparage in the least the results obtained by the Assos expedition, results not brilliant, but sound and extremely useful, or to object to an American archæologist who works in whatever part of the world he thinks best, yet it does seem that Americans ought to labor in America, if there is any preference to be made. And why? Not because the classics are to be despised or classic architecture and art slighted—any part of the globe is open to the archæologist. Nor because there is anything in the Know-Nothing cry of America for the Americans. The world of science knows no boundaries or nationalities, and only admits of the healthy stimulus of

national emulations. Nor because, at times, we are somewhat tartly reminded by Europeans that we had better work on our own ground instead of pottering in their footsteps. Their criticism may or may not be worth considering. But because few, if any Europeans, are working systematically at American archæology; the field is comparatively unoccupied; and because a race of the grade we will call partly civilized (for need of a term more accurate), like the Indians of Mexico and Peru, leave behind them as a rule memorials that are extremely perishable, whether from the rudeness of their art, or the peculiar traits of the climate under which they are found.

Arguments or suggestions similar to this must have been brought to bear on the committee, for in their recent report the need of setting vigorously to work on this continent is fully stated. It is great satisfaction to read: "The work is anything but one of barren antiquarianism. We are dealing, it is true, with savage and barbarous tribes, and aggregations of tribes, who have done nothing for the higher progress of mankind; but the questions involved are as broad and far-reaching as any in the whole field of inquiry

concerning man." "The vast work of American archæology and anthropology is only begun." One may pardon the continued insinuation about the "higher progress of mankind" for the pleasure of seeing the right spirit appear. Other archæology need not be neglected, but American work should absorb the chief powers of the Institute.

We are surprised to find that less than two hundred members were reported at the third meeting of the Institute. The annual dues are only \$10.00, but in America it would seem to be easier to obtain large sums from rich men to put up separate college-buildings, or to carry on separate charitable or other institutions, than to obtain numerous annual subscribers in help of a purely scientific object,—men who will be content, as their reward, to enjoy the interesting special publications of a society, and the consciousness that they are helping on a good cause. It is different in the older countries, and as culture is extended in America this sort of subscription will become more common. Meantime, we hope to see the membership of the American Archæological Institute doubled before the next annual report.

---

## LITERATURE.

### Sanborn's "Thoreau."\*

Mr. Sanborn's "Life of Thoreau" will be a disappointment to those who expected a business-like and straightforward biography. He seems to have felt called upon to write the story of Thoreau's environment rather than of his life. Village anecdotes and the genealogies of Barretts, Ripleys, and other families of embattled farmers and parsons, fill half the volume. The book is readable and will have a personal interest for the frequenters of the Concord summer school of philosophy, and for others who have enjoyed the charming society of the transcendental Mecca,—intellectual without stiffness, and simple, yet not provincial. But it is to be feared that readers who have no associations with the town will find the author's pleasant gossip somewhat irrelevant. Three men of genius have illustrated the annals of Concord, and it is as the home of Emerson, Hawthorne, and Thoreau that the town is interesting. But a thorough-going Concordian always finds it hard to understand that the world is not equally interested in every other person and thing connected with the sacred soil.

Emerson's little sketch of Thoreau, introducing the latter's "Excursions," remains still the best interpretation of his life and genius, outside his own writings. Of the two other lives that have been written, that by "H. A. Page," a British writer, is mainly a rescript from Thoreau's books, and is stupidly mistaken in its critical positions; while Mr. Ellery Channing's is a study rather than a life, and is, moreover, so disfigured by affectations that it can hardly be read without pro-

fanity. Mr. Sanborn's book is unlike these, in being at once appreciative and sober. But the slenderness of its material suggests a doubt whether his subject's outward life was eventful enough to support a regular biography. A man who stayed at home, who never married, who shunned the society of men for that of nature and his own thoughts, and who has recorded the last quite fully in his journals and published works, leaves his biographers very little to do.

The most individual note in Thoreau was his inhumanity. He tried to free himself from man and to realize the unconscious life of nature,—to get at the heart of it. "What are the trees saying?" "Man is only the point where I stand." It is therefore a little amusing to learn from Mr. Sanborn that Emerson, with an artistic instinct for unity of impression, objected to the insertion, in the collection of Thoreau's letters printed in 1865, of passages containing "Some tokens of natural affection." A further disturbance of our ideal is this recitation of what befell in his last illness. "Once or twice he shed tears. Upon hearing a wandering musician in the street playing some tune of his childhood he might never hear again, he wept and said to his mother, 'Give him some money for me!'" Perhaps the journals which Mr. Blake means to publish will reveal still more of the tenderness underlying that "perfect piece of stoicism" which Emerson wished to exhibit. It is due to the memory of Thoreau, and creditable to Mr. Sanborn's friendship for him, to let us feel that warm side of his nature which he constantly turns away from his readers. But one can easily sympathize with Emerson's fear of marring "his classic statue" by intruding upon the reserve of that fine and lofty spirit which was Thoreau.

\* Henry D. Thoreau. By F. B. Sanborn. Boston: Houghton, Mifflin & Co. (American Men of Letters Series.)

## American Archaeologists in Greece.\*

THE third year of the Archaeological Institute of America is not entirely barren of results, although the explorers working under its direction have hardly begun to realize the problems before them and to come to useful conclusions on the data gathered. A new and struggling organization, the Institute appears to be able to undertake at least two widely different tasks: the one being in the direction of early American civilizations; the other occupied with the classic land of Greece in Asia Minor. Whether it was wise to divert the energies of the Institute to directions so opposite remains to be seen. In 1880, the lamented Indian archaeologist, Morgan, gave to the Institute the results of his life-long study of the architecture of the half-sedentary Indians of North America, particularly of the Six Nations, with suggestions as to the architecture of older and more sedentary tribes and gentes of Central America, Mexico, and South America. The same year Mr. J. T. Clarke, who had shown much taste for archaeology in connection with the architecture of Greece, offered an interesting paper on the Troad. Mr. Bandelier took up last year the mantle of Mr. Morgan and gave the Institute some of the results of his studies of the great community houses or "towns" of New Mexico. He has pursued the same line elsewhere, and may be expected soon to offer further particulars in regard to Mexican and Yucatanese architecture. The present volume is given over entirely to the gentlemen who have been camping at the site of Assos in the Southern Troad, not far north from the island of Mytelene, and in full sight of Lesbos. The organization seems to have been unusually complete; the exceedingly interesting and well-written report is by Mr. Clarke, while Mr. W. C. Lawton furnishes historical and topographical notes on various sites and ruins in the Troad, and Mr. J. S. Diller notes the geology thereof. The appendix also contains the inscriptions found at Assos during 1881, in fac-simile, in ordinary Greek, and in translation. The most remarked sculptures unearthed, as well as a bronze inscribed tablet, are given in handsome illustration, and nothing is left to ask of the editors as regards maps, type, paper, and good taste in publishing. The profile and ground plan sketches may be noted for special praise. They put the scene before the reader in such a fashion that he is likely to understand more about the locality, the ruins, and the sculptures, than if he had visited Assos.

The chief explorer has the usual story to tell of Turkish evasions and delays, and fanaticism. With ability and clearness he describes and reconstructs the temple of Assos, noting the errors and extravagances of earlier explorers, and for the first time making accurate measurements of all the parts of which specimen stones could be found. The columns of this early model of a Doric temple had, strange to say, no "entasis" or irregularity in the thickness of the drums, whereby the Greek architect (of the Parthenon, for instance) cheated the eye, and gained majesty and grace for his structure in the process. Moreover, though the temple shares with the recently discovered fane at Per-

gamon the unusual trait of being Doric in type, yet, surrounded by a full colonnade of columns, six in front, twelve on the sides, it did not have a symmetrical "epinaos" in the rear of the central fane proper, to balance the vestibule in front. The rear wall ran across without break for door-way and without the two columns that decorated the other or entrance end of the shrine. A mosaic pavement was found partly in place, and some very interesting friezes, in a rough and uneven style of art, were added to those already known to the world through the specimens in the Louvre. They consist of a Hercules shooting at three centaurs with human fore legs and equine quarters, a fragment of the central relief composed of sphinxes, rude figures of two men fighting, and of a man pursuing a woman, several lions, etc., etc. The restorations of an ancient Greek bridge of stone near Assos are highly valuable. Less important are Mr. Clarke's endeavors to connect the reliefs found here with the art of Assyria. Not that the theory is likely to be wrong, but that the materials are not abundant or important enough to stand the weight of the theory. Mr. Clarke cannot claim the popular interest that entirely new and unexplored ruins awaken. He is on the ground of French and English excavators, who have left him only the toilsome part of the work, the measurements and verifications, the weighing of evidence and the collation of authorities. As to this last point the book is most valuable. But in archaeology the race nowadays is not to the swift. The greatest pains and the strictest probity in dealing with apparently unimportant facts are needed now, unless the excavator wishes to see his fondest theories upset, and his own fame as a man of honor impugned. In spite of the apparently meager return of this expedition, in reality, the results are, so far, excellent. Mr. Clarke has shown his fitness for such tasks, and the further work he has laid out, namely, the examination of the Roman and mediæval parts of Assos, more especially of the fortifications, will be looked for with eagerness. To architects and to those who love to examine the architectural creations of man, the work he is doing cannot easily be overpraised.

## Mrs. Oliphant's Literary History.

IT is characteristic of Mrs. Oliphant, as being both a novelist and a woman, to take a personal view of literature. Her book is one to be put on the same shelf with Thackeray's "English Humorists," and we give it high praise when we say that it is not unworthy of such neighborhood. Very much what Thackeray did for the generation of Pope and Swift, she has done for the Georgian era, and with this addition, that while Thackeray dealt almost entirely with the man, she has dealt also with the author. It is true that life and character interest her primarily, but the books that issued from them receive more attention than in the lectures of the great humorist—whose estimate of some of his eighteenth century forerunners was altogether too high. Her book may be described as a biographical history of literature, if we may borrow a title from Lewes. It is something midway

\* Papers of the Archaeological Institute of America. Classical Series I. Report on the Investigations at Assos, 1881, by Joseph Thacher Clarke, Boston: A. Williams & Co.

\* The Literary History of England in the End of the Eighteenth and Beginning of the Nineteenth Century. By Mrs. Oliphant. New York: Macmillan & Co. 1882.

between a systematic, objective history of literary tendencies and products, and a collection of anecdote and gossip about literary people. The defect of a literary history written from this point of view is apt to be that the writer overlooks or slights that large class of works which have little explainable connection with their author's own personalities. Mrs. Oliphant's method is quite satisfactory when applied to Cowper, Wordsworth, and Byron, who put themselves into all they wrote; but is noticeably unsatisfactory when Shelley, Keats, and Landor are under consideration. Poets often lead a double life, and their poetry must be examined independently. Landor's writing, for example is a thing quite apart from his personal career. The former is high, stately, calm as an antique marble; the latter was full of rages, extravagances, and all manner of whim and unreason.

Mrs. Oliphant has not, of course, the brilliant, satiric style of Thackeray, but her feminine penetration into the weaknesses of character, and her soft irony are almost as effective. Her portraits, if not so highly colored, are more delicately shaded. None but a woman could have written the chapter on Cowper, with its sympathy for all that was womanly in his nature, and a woman's contempt for all that was unmanly in it. This is quite a different touch from Byron's masculine disdain of Cowper as "a coddled poet." As we read Mrs. Oliphant's keen but kindly analysis, we feel that she is of the sex which coddles and yet half resents the weakness of the coddled object. Perhaps the best that has been said about this invalid genius has been said by women; witness the famous lines of Mrs. Browning, herself an invalid.

Remembering Mrs. Oliphant's novels, we are prepared to find that the pleasantest and freshest parts of her literary history are those in which she sketches some one of those humbler schools or coteries of literati which flourish briefly in provincial cities. Of such a kind is the delightful chapter on "The Swan of Lichfield," in which are quaintly and lovingly portrayed the small poms and affectations of a constellation of now forgotten genius, consisting of the great Dr. Darwin, Miss Anna Seward (the Swan), Archdeacon Vyse "of Prioric talents in the metrical impromptu," Mr. Day, the author of "Sandford and Merton," "the ingenious Mr. Kerr," "the accomplished Dr. Small," and many other lettered gentlemen and ladies who lived under the shadow of the Episcopal towers, and "most of whom could make agreeable verses."

Mrs. Oliphant slightly overpraises the rather drab and old-maidish novels of Miss Edgeworth, Miss Austen, and Miss Ferrier. She is herself a scholar of that school, and in the case of Miss Ferrier her national feeling as a Scotchwoman probably comes to reinforce the similarity in sex and taste. But, on the principle that a critic is always best worth hearing when criticising what he best loves and understands, the chapter on the three lady novelists is one of the most readable in the book.

Mrs. Oliphant's critical summaries are usually good. Her taste is seldom at fault, and yet as a critic she is not original or authoritative. She seems deficient in grasp and insight. The essential character of a book or a writer often eludes her, and she dwells on the accidents of the thing,—manners, income, personal

appearance, etc. Here is a poet like Byron, for example, whose works have become a part of the intellectual consciousness of the race, and who voiced certain thoughts that came uppermost in his generation more fully and intensely than any other man. It is well, doubtless, to know that this Byron had a dread of growing fat, and that he shaved his front hair to make his forehead look high, but there is a certain triviality in insisting too much on such details. Mrs. Oliphant has a woman's distrust of "classical" literature, and she speaks repeatedly in a petulant tone of the small obligations of literature in England to the universities. *À propos* of a gift of "a handsome rosewood chair," sent to Miss Jane Porter from admirers in America, Mrs. Oliphant writes, not without bitterness: "In default of other acknowledgments, perhaps some of the writers of the present day would not object to similar testimonials from that great transatlantic audience which British writers are expected to minister to, like Spenser's angels, 'all for love and nothing for reward.'" By the way, our author attributes to Cary's Dante "a lasting value which no other translation has attained." Scholarly opinion, we think, holds that there are at least two American translations better than Cary's.

There are occasional reflections in Mrs. Oliphant's pages so acute, or so broadly true, that they put her for the moment on a higher plane of thought than that which she habitually occupies. Thus, in speaking of the reception given to the "Lyrical Ballads" she makes this really profound remark: "It happens sometimes that under the great outcry of indignation or dislike, raised by a certain work or act, there is a subtle, indescribable deposit left by its mere contact with the mind of the reader, which is the foundation of the fullest and truest fame." Have we not seen this verified in the instance of some countrymen and contemporaries? There is Emerson, for example. It is curious to read nowadays the blasphemies uttered in the "Southern Literary Messenger" and other defunct organs of literary opinion, when his first volume of poems was published. And there is Walt Whitman. The armies of the reviews have passed over his body, heavy artillery, baggage-trains, and all; yet still there is that "deposit" sticking obstinately to the minds of many who have not quite made up their opinion whether he is a great genius or a great humbug.

#### Nadal's "Essays at Home and Elsewhere."\*

WE are always glad to get hold of an essay or book by Mr. Nadal. There is a quality about his writing that is peculiar and personal. He sometimes flattens,—says things in a surprisingly tame or vague way;—he very often fails to round out his theme in a perfectly satisfactory manner; he sometimes seems to be writing with an amusing air of patronage,—with a very decided "look from above downward." These traits in Mr. Nadal's writings irritate certain critics, particularly English critics, in an astonishing manner. One sometimes sees his work ridiculed in an English journal with an elaboration that makes one wonder at the inconsistency of the critic who can

\* Essays at Home and Elsewhere. By E. S. Nadal. London and New York: Macmillan & Co.

spend so much time in fixing the status of so inferior a mind as that of the author criticised. One is inclined to ask: If the writing is so poor, why do you find it necessary, O critic, to say so many severe and bright things about it? Why don't you dismiss it with appropriate contempt? Why do you return again and again and again to the charge?

For our part, we believe that the reason the adverse reviewer pays so much attention to Mr. Nadal is that there is something vital in his writings—something, too, that may be called even fascinating. As we have said, it has faults: notably a certain lack of restful completeness. Some of his essays seem rather to cease than to come to an end. But there are plenty of people that can give you a fully rounded opinion on various literary and social subjects, who, after all, are merely summing up what they have learned from others. But Mr. Nadal, in his slightest sketch, is sure to say something original,—something that is apt to be novel and penetrating; something that will leave a permanent impression upon the mind.

Of the thirteen pieces here associated, about half were first printed in this magazine, so that our readers may be supposed to be acquainted with the flavor of the writer, as shown in such papers as the "The Old Boston Road," "Artemus Ward," "A Day or Two in Sussex," "A Trip to a Political Convention," etc., etc. From an essay on Matthew Arnold, which appeared first elsewhere, we quote a passage which seems to us to contain a great deal of timely truth:

"It is not fair that the Philistines of the two countries should be confused. In so far as an American is a Philistine at all, his Philistinism is accidental and ignorant. He is an amiable being. You may go into his camp; he will let you play with his spear and helmet. He errs solely through ignorance, and is very teachable. Your way of thinking may be a little beyond him, perhaps, but he would not oppose you. Now, Mr. Arnold would no doubt assure us that the quality of an English Philistine is a certain angry resistance to everything which he does not comprehend. There are traces, too, that he does not understand the distinctive character of the people of this country. He does not understand that we have one. I do not believe that there is any country in the world which has a more distinct type of individual character than the United States. I know the reverse of this is the common opinion abroad. Lord Beaconsfield said that there is nothing in our manners original and indigenous. Very well, if we select the best of all other peoples and nations, perhaps we need not fret on account of our want of originality. But the common opinion abroad is not true. There is a great deal that is original in the individual American character. What is peculiar in that character does not lie upon the surface, and, I think, is too delicate for the comprehension of the foreigner. It is best understood and quickest recognized by Americans themselves. There may be nothing in his speech, nothing in his accent, manner, dress, or mien, to distinguish him, but you may quickly recognize the man whose mind has received the social education of this country."

We should like to quote many passages,—happily descriptive of natural scenery, or notable for beauty of expression, or for moral insight and bravery,—but must content ourselves with a special recommendation of the concluding chapters to all writers for the press, and a "general recommendation" of the whole book to all thoughtful persons.

#### Mallock's "Social Equality."

MR. MALLOCK has developed an original talent for constituting himself the champion and apologist of causes against which the tide of modern opinion sets with unmistakable strength. Were his style more enthusiastic and captivating, and were his arguments franker, one would be much readier to applaud; for the task might appear chivalrous. He might then be called an intellectual knight-errant, doing battle for the losing side on the broad ground that a fight ought to have some show of evenness on the opposing sides. But it is hardly possible to accept that view of him. He has intellectual force enough to stir one's curiosity, and perhaps stimulate one to think; and, when that is said, very great praise must be understood; for how few writers are capable of so much! There is a taint of the partisan about almost all his books, and of the partisan, moreover, who is not so much enamored of his cause as interested in it after a dilettante fashion. Yet it may be also true that Mr. Mallock represents after a somewhat willful fashion a large and still influential portion of the voters of Great Britain. Whether they recognize him or not, he speaks in his own way as a mouth-piece of the upper classes of Great Britain and Ireland, whether it be in regard to their hankerings after and coquetry with the Roman Church, or their somewhat Parisian code of morals, or their natural aversion to democracy in most of its forms. In this his last venture Mr. Mallock, while basing his arguments mainly on the ground prepared by his opponents for the time being, appears as a fighter for the great cause of caste. He ought to have on his side all the people who aspire to or believe themselves members of "society" in all the civilized nations of the world. He may concede more to the spirit of the age than most of them would allow. He may proceed on lines of argument hardly possible without accepting the ground-work patiently laid by Darwin, and may give more honor to Spencer, while seeking to criticise him, than the orthodox and respectability-preaching Englishman cares to hear. But he is nevertheless one of their fighters, and no mean dialectician withal, considering the dearth of good writing on their side of the quarrel.

Mr. Mallock wishes it known that he has come upon a truth so imperfectly touched upon by political economists that he can call it his own. It is a "missing science," and consists in the fact that human nature, not society, demands social inequality, must have it, will have it; unless it gets it, a stop will be put to the advance of civilization. The maintenance of civilization, indeed—for to stop is to retrograde—depends upon two processes: the constant development of the higher forms of labor and the constant intensification (increase in severity) of the lower. And in each case equally the cause that operates is inequality. In the first it operates by producing a desire for itself in the laborer; in the second it operates by exerting a certain pressure upon him. In the one case it attracts, in the other case it propels. But in both cases, in one way, what it does is the same. In both cases it endows

\* *Social Equality. A Short Study in a Missing Science.* By William Hurrell Mallock, author of "Is Life Worth Living?" London: Richard Bentley & Son. New York: G. P. Putnam's Sons.

the laborer with powers which, in its absence, would be wholly wanting in him. In its absence there could be no continued industry, just as in its absence there could be no developed skill. Man's power of producing more than a livelihood depends upon causes that are without him, and not within him; and these causes consist essentially, and they always have consisted since the earliest dawn of history, in some arrangement more or less effective of marked social inequalities.

Mr. Mallock shows his address as a dialectician in this, that he nowhere distinctly formulates the creed which he attacks. One does not know whether it is that of the wildest communist, or of a picturesque grasper of a partial truth, like Henry George, or a laborious fashioner of a system of "philosophy" like Herbert Spencer, or a commoner of the stamp of John Bright. He is much too clever to give the reader so much foot-hold. He attacks democracy (with a large D), and the democrats. But one might as well point out a particular wave in the ocean with one's finger. Few believers in democratic and republican systems hope or wish for the dead level of social equality that Mr. Mallock attacks with so much skill. Few will deny that differences must occur, and by their occurrence create a healthy interchange of efforts, and, moreover, keep up the stimulus indefinitely after the first successes are attained. But that is not saying that the old spirit of caste, which lingers on in islands like Great Britain, and until recently in Great Britain's geographical counterpart in the Pacific, Japan, is a desirable thing in itself, or good for either the upper or lower ranks of a commonwealth. For it is that of which Mr. Mallock's book is really the defender. In his attempt to prove that inequality of conditions was the mainspring of all past progress (and therefore of progress hereafter) he denies to general benevolence any place.

"Actions motivated by benevolence have been sufficiently marked in history to show us clearly enough their constant limits and purpose. This purpose has never been the creation of new forms of wealth, it has been simply the alleviation of the existing pains of poverty." (Page 163.)

On page 180 he alludes to this unsupported statement as to an axiom.

"As to benevolence in connection with inventors and discoverers, we have dwelt upon that already; and we have seen that, by itself, even with those men, it is utterly powerless as a motive."

In fine, Mr. Mallock means to say that, if we take away from men all hope of bettering themselves by work, and do not allow the rich and powerful to force the unambitious to labor, civilization will fall off. We have given freedom to slaves. If now we stop capital from goading men to labor, and give the ambitious no prospect of raising themselves above the mass, the whole machine will come to a stop, or, which is the same thing, anarchy will ensue. The natural inference is: keep up social divisions, rank, and titles. They are the corollaries and condition of the healthful working of the human hive. Mr. Mallock's book is full of half-truths which might have been supported better had he more heart in the work. It is not likely that it will make a profound sensation; but no one can read it without some of the pleasure that came from several other of his brighter and more popular efforts.

#### Asbjørnsen's "Folk and Fairy Tales."\*

THE fairy tales collected by Asbjørnsen and Moe (the Brothers Grimm, of Scandinavia) are well known to the English-speaking public. It is many years since Dr. George Webbe Dasent translated the original collection, and since then the best of the tales have become fairly domesticated in our literature. The more ambitious, half-autobiographical "Huldre Eventyr," which Asbjørnsen published later under his own name alone, have never until now been much known outside of Norway and Denmark, and, as they are as charming in style as they are unique in character, they fully deserve to share the popularity of the earlier collection. It was, also, a happy idea to reproduce the illustrations of the Christmas edition of 1879, nearly all of which have a strong flavor of the soil, and are in the most delightful sympathy with the text. Full of the national spirit are, especially, the drawings by Mr. Otto Sinding, although he occasionally lapses from the strength and individuality of such work as *The Lad and the North Wind* (page 163), and *The Foolish Men* (page 203), into a more conventional romanticism; as, for instance, in the pretty figure of the weeping girl in the story "East of the Sun and West of the Moon." The fact that Norway has such a promising school of native artists is, really, in part due to these very tales and the national movement of which they were the first indication. Mr. Asbjørnsen, though his style is cosmopolitan, and has none of the Bjørnsonian marks of nationality, was, nevertheless, one of the earliest pathfinders in the wilderness through which his more famous successor has broken a broad highway. In his capacity of sportsman and government superintendent of forests, he roamed from one end of the land to the other, coming constantly in contact with primitive people of all classes, and noting with keen perception the characteristics of the national physiognomy. The *Huldre* stories, which are interwoven with his personal adventures, have, therefore, a wonderful fascination, and one never wearies of following him on his long tramps through the woods in search of hares and trout and fairy tales. There is a deep poetic feeling, too, in his descriptions of nature; not the vague gorgeousness of William Black and his novelistic compeers, but a definiteness of color and detail, such as one finds in the essays of John Burroughs. Every bird and beast has its right name, and its habits are described with a vividness and felicity of phrase which betray the poet, and an affectionate minuteness which shows the trained eye of the naturalist. It is, therefore, a great pity that the translator has in these very passages adopted a vocabulary which very inadequately reproduces the combined effect of scientific precision and poetic insight which distinguish the original.

Mr. Gosse's introduction is descriptive rather than critical, and gives a very correct estimate of Asbjørnsen as an author, and of his influence upon Norwegian literature. The biographical data are simply and interestingly given. We may, however, be permitted

\* *Folk and Fairy Tales.* By P. Chr. Asbjørnsen. Translated by H. L. Brækstad. With an introduction by Edmund W. Gosse. New York: A. C. Armstrong & Son.

to remark that Asbjørnsen's name is Peter Christian, not Peter Christen. Possibly this preface was written while Jørgen Moe was Bishop of Christiansand; but, as the American edition bears the date of 1883, his death should have been noted.

#### The Latest Volume of "L'Art."\*

THE second quarter of "L'Art" is naturally in great part devoted to the pictures in the late Salon, and not to the French contingent only, but to the foreign. Very pleasant things are said of the Scandinavian artists who exhibited, and the work of the Hollander Josef Israels, a Hebrew by descent, is appreciated as only French writers know how to appreciate when they set out to praise. It would have been hard if the painter of "Dialogues Silencieux" had not been well spoken of in the chief artistic publication of France, for one might wander far among the French living painters before finding an artist capable of expressing so much quiet pathos as one sees in this picture. M. Israels furnished "L'Art" with a pen-and-ink sketch of his fine painting. It appears that his son Isaac, seventeen years old, shows remarkable talents. Judging from his sketches published in the same article, he is lacking in sentiment and somewhat stiff and hard in his style, but, considering his age, may be looked upon as something of a prodigy. A Chilean artist, named Lira, is also complimented by the critic, who is Paul Leroi—one of the steadiest contributors to "L'Art" and other artistic publications. Artists of Belgium, Russia, Switzerland, are noticed by the same hand. The remarkable falling off in the quality of French painting, which was pointed out in 1880 in letters from Paris to the New York "Times," but which were little heeded at the moment, either here or abroad, causes M. Leroi to give a genuine cry of alarm. What he thinks of the artistic situation in Paris may be gathered from this: "There is not the slightest illusion remaining: France is on the road to a Sedan in the fine arts." He means, however, a Sedan in painting, not in sculpture. "This year her defeat is signal. In painting, the United States, Great Britain, Switzerland, Holland, Sweden, Denmark, Norway, Germany, etc., are rivals as to who shall beat her most, according to the verdict of every sincere mind." That this is really the opinion of many art critics and connoisseurs may be seen from the fact that the *prix de Florence*, given by "L'Art" every year to the best artist showing work at the Salon, who is of a certain age and will reside for a given time in the city of Florence, was granted to a young Norwegian of some promise,—a certain Hans Heyerdahl. The committee of award was composed of a sculptor, an architect, two engravers, a painter, three art-critics and an amateur, thus offering a pretty wide sweep of taste and opinion on the fine arts. It is not very cheerful reading, this wail from one of the best-informed and most sensitive critics that is writing in France at present; but there is room to hope that his patriotic zeal will be infectious among the artists, and that more strong youngsters like Bastien-Lepage, Dagnan-Bouveret, and one or two more, will soon make their appearance, and put France more on an

equality with her former fame in painting. What M. Leroi will have to say to the North American contributors will be very interesting to read.

"L'Art" for this quarter is not of particular strength, compared with what it used to be. The same fact has been noticed more than once of late. Is this the result of the diminished force in French art generally? The etchings are, as usual, a strong "holt." Among them is work by Gaucherel, Greux, Mongin, Jacomin, and Bocourt. Eleuterio Pagliano gives a pleasant etching of his painting, "Washer-woman—Souvenir du Lac Majeur." Not much is to be said of "High Life," by Jean Beraud, whether as an original composition or an etching by Édouard Ramus. It was shown at the Royal Academy. Questionable in taste so far as society goes, the faces as rendered by the etcher are simpering and meaningless, without offering enough point to make a satire felt. The etching is harsh and coarse, instead of bold. The portraits of Courbet etched by Bocourt, and of the promising Scotch painter Orchardson, etched by Mongin, are most admirable. Better still is Bocourt's portrait of Camille Corot; it smiles and almost speaks a humorous phrase. There are the usual short articles on archaeological objects having artistic value, on old tapestries, books, on French painters (Delacroix, Pagnest, and others), and on old masters (two pictures in English hands attributed to Giorgione and Raphael). But the volume, though of course full of interest, does not quite come up to expectation.

#### Robinson's "Under the Sun."\*

THERE is a good deal that is interesting in Mr. Robinson's book, and his stories about the crows, tipsy geese, cats, wolves, bears, mermaids, and tigers of India, have a certain flavor of personal observation about them. Although the value of his *ipse dixit* probably does not extend beyond the domain of the crow and the cat, he has a certain faculty of presenting vividly what he describes. He has the narrator's talent, and with it the common faults of the teller of stories. He makes a great deal of fun of a very poor quality, his style is provincial, and his statements are too often exaggerated or inaccurate to be of value as facts.

To Mr. Robinson's book, Mr. Edwin Arnold has written a short and laudatory preface. The fact is, that Mr. Arnold, who is an enthusiast about India, likes Mr. Robinson's "pleased spirit"—as he calls it—in writing of the country. Mr. Arnold is himself an "old Indian," and might fairly be supposed to understand the value of such sketches as the present; the least he could have done in writing a preface was to warn a confiding public to take the book with a grain of salt. The value of Mr. Arnold's own work is purely philosophical and literary, and as such is very great. But, being full of genius and the doctrines of Gautama, he has unconsciously contributed more to the spreading of erroneous ideas about India than any other living man—as witness the fact that, since the appearance of "The Light of Asia," many English and most American readers believe firmly that Buddhism is the religion of India at the present day, whereas there is not a Buddhist to be found among the two hundred and odd million inhabitants of India.

\* L'Art: Revue Hebdomadaire Illustrée. Huitième Année. Tome II. Paris and London: Librairie de L'Art. New York: J. W. Bouton.

\* Under the Sun. By Phil. Robinson, with a preface by Edwin Arnold. Boston: Roberts Brothers.

proper. Similarly,—and the parallel is by no means far-fetched,—Mr. Robinson would persuade the world that modern India is given over to a menagerie of monkeys, snakes, conjurors, and *punkah-wallahs*, all living together in peace and brotherly love under the paternal rule of the kindly British,—the whole being a subject for congratulation and mild, very mild fun.

To a person who has lived for any length of time in India, and especially in the precise part of the country to which Mr. Robinson's journalistic career in the East called him, his sketches must appear incongruous and out of drawing. The style which the author used so effectively in his recent letters from Utah to the New York "World," playful, sanguine, and, like Sigismund's Latin, occasionally *super grammaticam*, is not appropriate to the splendid melancholy of unhappy India. In instance of the provincialism which now and then crops up in Mr. Robinson's writing, we quote the following passages: "At home they [*i. e.*, cats] are silent, but entering a neighbor's premises they at once commence to confide their sorrows to the whole parish in melancholy dialogue, which in the morning are found to have been accompanied by violent saltations upon the flower-beds" (page 219). And again (on page 220): "Sitting on the spouts or chimney-pots of the houses round," etc. The English press is responsible for a good deal in holding up the writer of these sentences to our admiration as "a new genius on the horizon of English literature," and a thoughtful publisher has appended various "press notices" to the volume, apparently in order that the reader may be put to no inconvenience in forming an opinion for himself.

In spite of many faults, however, there is merit in Mr. Robinson's book, of the narrative kind. If he would be less funny, more grammatical, and, above all, a little more conscientious in his judgment of Indian life, he would do better. Nothing is more dangerous than the faculty of drawing vivid pictures of detail so as to convey a distorted impression of the whole; and we have no hesitation in saying that any one, not personally acquainted with India, must of necessity form mistaken ideas about the country and its people from reading these sketches. There is too wide a contrast between the tragic realities of that unhappy empire and the facetious medley presented to us in "Under the Sun." One must be a Voltaire to make fun out of the tragedy of human lives. Farcical sketches from the private life of Agamemnon and Clytemnestra would hardly meet with much success, even at the present day.

"Old Indians" will remember reading the first edition of "My Indian Garden," published by the "Pioneer" press in Allahabad some years ago, and they will also remember that the success it attained was not universal. There is nothing, either of truth or wit, in this volume, worthy of comparison with the

famous Indian sketches by "Ali Baba," published in the London "Vanity Fair," about three years ago; more absurd even are the published comparisons of the author with Charles Lamb, to whom, in substance or flavor, he has not, in our judgment, the remotest literary likeness.

Cox's "March to the Sea" (Campaigns of the Civil War. X.)\*

GENERAL COX labors under a great many disadvantages in the volume now before us. His space is extremely limited for so varied a subject, and the whole ground has been covered by General Sherman, in one of the most entertaining and instructive books of modern times—not to mention a host of minor writers. The subjects dealt with are Sherman's march from Atlanta to Savannah, and thence through the Carolinas to the surrender of Johnston's army; Thomas's campaign in Tennessee, after Sherman's departure; and Stoneman's and Wilson's great cavalry expeditions in the spring of 1865. These movements were widely separated, and, though they all formed parts of one great plan, yet their details were entirely unconnected. In attempting to describe them all within small compass, the most that can be done is to give the outlines of each, and constantly to show the relations which they bore to each other, without attempting to go into details. We fear that this book is open to the criticism of neglecting the general bearing of the various movements, and of attempting to refer to too many minor events, so that, while there is evidence of a constant struggle to compress the story within the prescribed limits, it has somewhat the appearance of a collection of odds and ends—a sort of clearing up of what was left of the war, outside of General Grant's operations, during the last six months of its existence. General Cox was a prominent actor in one series of the events which he describes, and, though he keeps his own personality far in the background, yet he sees the events from a point of view which is altogether too close for the historian, or for the wants of the general reader. On the other hand, his tone is eminently calm, impartial, and judicial, his estimate of the character and intentions of the principal commanders is intended to be fair and unbiased, and his way-side sketches of the life of the troops on the "frolicsome raid" through Georgia, and their patient, hardy endurance through the swamps and rain of the Carolinas, have permanent value as a record, apart from their attractive and picturesque character. But, leaving aside the latter, the story drags a little, and, though it must command respect as a faithful and painstaking account of very important events, yet it is not a book to create enthusiasm among its readers.

\*The March to the Sea. Franklin and Nashville. By Jacob D. Cox, LL. D. (Campaigns of the Civil War. X.) New York: Charles Scribner's Sons.

## HOME AND SOCIETY.

### Club Life in America.

THERE are, of course, clubs of some sort in almost every city of a certain size in the United States, and, in some of them, very good clubs; but in all, except

New York and perhaps Boston, club life is overshadowed and dwarfed by the more vigorous domestic life which surrounds it. It exists, as it were, under protest; is suspected of fostering a code of morality

different from that recognized in Christian homes, and of alienating the young from the practice of virtue. In such a hostile atmosphere, clubs must necessarily come to but a stunted growth. It might be suggested, perhaps, that it is from places which are not large cities that we get most of the popular, moral notions prevailing on the subject of clubs—just as we do of theaters, and of many other institutions of city life which, from the rural or provincial point of view, are of doubtful utility. It would be interesting to inquire, in connection with this, whether our whole system of social morality in America is not, to a very great extent, rural, as distinguished from the social morality recognized in older countries. Until within the past generation, society in the United States has been made up of rural or semi-rural communities; that is, it has been almost destitute of any very large cities in which city life could be carried on as such. The result has been the development of a system of morality adapted to semi-rural, but not to urban life. The philosopher might trace to this fact many virtues and many vices. On one side of the account we should have early marriages, fondness for domestic life, steady habits; on the other, a narrow provincialism, leading to national conceit, arrogance, and a profound indifference to the ties of international morality.

Now, we find ourselves in a period in which large cities are springing up on every side, and as large cities will always, in the long run, impose their views of the art of living upon the community, a struggle is arising between the old and the new. It can hardly be doubted that the cosmopolite view of the art of living is making rapid headway in the United States. But it may be doubted whether the change has yet proceeded far enough to give club-life anywhere in America, outside of New York, a distinct importance.

A club, properly speaking, consists of a certain number of men (in England, there are signs of the distinction of sex being swept away, and women been given the right of establishing and carrying on clubs; but of the questions suggested by this innovation, it is not necessary here to speak)—men of kindred tastes, habits, and social conditions, who desire to secure the "comforts, without the responsibilities" of a home, at a moderate cost. It is essential that there should be a community of tastes, habits, and social conditions, for otherwise the street itself is a more agreeable place than a club. Now, English society does furnish an extraordinary number of men who come within this requirement. London is full of young men who have just been called to the bar, who are connected with the army, who are simply men about town, graduates of the same university, men interested in athletic sports, and men connected with the House of Commons, or, in some way, with public life. But it is a fact that the United States, which, of all countries, contains the largest body of persons possessing an average education, at the same time contains a very small body of citizens entitled to be classed as "clubbable" men. In New York, certainly, more are to be found than anywhere else; but the moment a comparison is made with London, the enormous difference becomes apparent. In London there is no profession or calling in life resembling a profession which does not boast at least one, and often two or three, clubs whose members

belong to it for the purpose of living in the society of a number of men with whom they have the nearest social and intellectual sympathy. In New York the really important clubs can be counted on the fingers of one hand.

One cause of this is, no doubt, the severance between politics and society, which in New York is so complete and remarkable. In a capital like London, most of the men connected with politics, the men who form "the governing class," are persons of a certain social position; but, in general, in New York the two worlds of Politics and Society are practically independent of each other, and, what is more, look upon each other with suspicion. Now, politics is the life of clubs. In London, as everybody knows, a very large number of the most prominent of them are made up of men of a like turn of thinking in politics, and among men it is a truism that politics is of all subjects the most naturally interesting. During the war the excitement of the time created a much closer tie than usually exists between politics and society. The wealthy and cultivated classes in the great cities, which usually eschew political life and associations, took a much more active part in public affairs than usual; and, accordingly, the effect of this was at once seen in the formation of clubs in all the large cities, half political and half social in character, but with the object of encouraging the diffusion of a sounder public sentiment. The Union League Club of New York is, perhaps, the only vigorous survival of that period, and, notwithstanding its rapid growth and importance from a social point of view, has not lost its political character.

Clubs in modern time are practically a product of Anglo-Saxon life, and have received their highest development in England. In Italy, Germany, Russia, or even France, they can hardly be said to exist except as exotics. Indeed, in France, since the period of the Revolutionary clubs (which were, of course, not clubs in our sense, though their remarkable development may be cited to prove the close connection between club-life in general and politics), the establishment of clubs has been mainly due to that imitation of England and English fashions which has, within the past quarter of a century, been carried so far in Paris. It would be worth the while of some social philosopher to analyze the causes of this preëminence of the Anglo-Saxon race, famed for its possession of a language which contains the word "home," in that institution which, of all others, is supposed by hostile critics to strike at the foundations of domestic life. It is probably owing to the possession of a larger class of wealthy or tolerably well-off men, who are fonder of comfort than continental men of the same class are; or the English fondness for clubs might be advanced by a friendly observer as an additional proof of the domestic instincts of the race, since its most homeless and undomestic classes insist on providing themselves in their clubs, with the nearest approach to domestic life which their means and tastes afford.

#### Mothers in American Novels.

IN reading the stories, long and short, which have appeared in *THE CENTURY* during the past year, I

have been struck by one point of similarity in them all, and that is the colorless characters and subordinate positions assigned to the mothers. And upon reflection I think this has become a marked characteristic of American fiction. I recall numberless novels, the heroines of which are bright, intelligent girls, the common American type, on good terms with their fathers, whom they generally resemble. The fathers are of all sorts, but the mothers only vary in being garrulous or silent; they are all essentially commonplace, doing the housework, without influence in the family, domineered over by the daughters, and treated with good-natured contempt by their husbands. Is this a true picture of American life? If so, what becomes of all the vivacious, intelligent girls? If marriage deprives them of the graces of girlhood, and arrests the development of its nobler qualities of maturity, they would be wise to remain unmarried. But I do not think it a true picture. Certainly it is not true of the women of the South-west. I know many noble, intelligent women, of middle age, mothers of grown daughters, on whom their influence is very apparent. They take no very active part in society, for they have no time, being strongly disposed to keep the burden of household labor from their daughters. This is not surprising when one remembers that they must know from experience that in this servant-less land there is little relief from domestic drudgery after marriage. What American girls, with the liberty allowed them, might become without the wise conservative influence of the mothers I dread to contemplate. Nor is the American girl as black as she is painted. Though she generally thinks she is as good a judge of "what is what" as any one, she has an unbounded love and reverence for her mother, and often yields, out of respect to her, to opinions which she considers old-fashioned or prudish. Though the position of the mother must be an inconspicuous one, her influence is the strongest in the world. American novelists should depict American mothers as most of them are: intelligent, devoted, self-sacrificing.

#### Carbolic Acid in the Household.

FIVE years ago, I was one day reading Tyndall's address before the Glasgow Science Lecture Association on "Fermentation and its Bearings on Disease." In that address he speaks of Professor Lister's wonderful success in the treatment of wounds by spraying them with carbolic acid while they were exposed to the air. While I was reading, a very white face showed itself at the door, and an awe-struck voice said, "Mother, Jane has hurt herself *dreadfully*." Jane was one of the old time "house servants" of Maryland, faithful, brave, plucky, but opinionated to the last degree, and immovably obstinate when she took a stand, which, however, was never done except upon a purely personal question.

Jane was found ghastly with the pallor which only a very black skin can show. She held out her thumb, from the ball of which an enormous splinter, as large as a slender lead-pencil, was projecting about an inch,—a hurt obtained in scrubbing very energetically. "Go for the doctor," were my first words, for I

knew the danger of lockjaw from such a deep, narrow-mouthed wound. Jane replied at once, with perfect respect, but with unflinching determination, "I don't wan' no doctor, Mis' S—. Ef you can't pull it out, I'll jes' let it stay in." Arguments and expositions were ineffectual against her iron resolve.

I did not dare, in my inexperience, to cut into the flesh and muscles to get hold of the proper end of the stick, and I could see nothing else to do but to draw the splinter through before the parts had had time to swell. I happened to own a fine pair of surgical forceps and scissors, with which I laid open the upper part of the wound, where the wood was near the surface. I then caused Jane to be firmly held, and succeeded in drawing the splinter through and out of the wound.

My next thought was of Tyndall's article and Lister's treatment, and, as the best device which I could think of at the moment as a substitute for the carbolic spray, I bound the wound up in a linen bandage wet in cold water, and, when it was on, I placed a few drops of carbolic acid on the wet cloth over the two mouths of the wound. My surgical operation over, I posted off to the doctor to ask him if I had done right. He approved, but said, "Why did you apply carbolic acid?" I answered, "Lister dresses wounds always with it, to prevent the access of germs." He laughed at my medical assumption, and said, with the superior air of the profession: "Well, it can do no harm. Call me in if the wound becomes very sore or suppurates." The doctor did not, however, have to be called; the treatment proved wonderfully effectual. I watched my patient carefully and anxiously. There was no suppuration, and scarcely any fever; the wound healed "by the first intention," and with so little soreness, that in three days Jane could do all her work without the least discomfort. The skin was perfectly formed and natural by the fourth day.

This was my first introduction to carbolic acid as a surgical antiseptic. Since then every wound, great or small, happening to a member of the household, which seemed to deserve any attention at all, has been dressed in the same way, and with the same results.

The reason why carbolic acid is so efficacious in many diseases, as well as in the dressing of wounds, is plain. Molding, fermentation, decay, the souring of milk, the suppuration of wounds, and the propagation of certain diseases are all due to the same cause,—to the presence of the germs of certain fungus-plants. The air we breathe is full of such vegetable germs; every breeze sows them broadcast, and every organic substance which is at all moist offers soil for their growth and development. Myriads are sown everywhere; some of them take root and grow in one substance, some in another; those which do not find the peculiar nutriment they need, perish. It was for a long time supposed that the same germ produced different organisms when deposited in different fluids,—that the mold on an old boot, the fermentation in a jar of preserves, the change of grape-juice into wine, and of wine into vinegar, were merely manifestations of the same living organism under different conditions,—but the exhaustive researches of Pasteur have proved that the stern law which was impressed upon the vegetable world when it came into being, that each was to bear seed "after his kind," is as inexorably true of the organ-

isms which elude all but the most penetrating microscopic power as it is of the mighty forest-oaks and gigantic mountain-pines. The true explanation of the phenomenon was that the air sowed all kinds of seed everywhere, but that these only sprang up where they found congenial soil. The wind-sowed germs falling upon the surface of bread, or cheese, or sweet-meats, grow into airy forests of pearls and emeralds and topazes, which we, with our coarse vision and rude classification, contemptuously name mold.

If, instead of falling on the surface of preserves, the air gets mixed through them, when it finally escapes it leaves the tiny germs behind. If these could find no oxygen, they would as surely be smothered and die as an insect would under the same circumstances; but the fungus has a resource which the superior insects lack. They can manufacture their oxygen out of the sugar in the syrup. Sugar is a compound of several substances, among others, of oxygen. When this oxygen is removed, there is no longer the compound sugar, but there remains some alcohol and other things. The preserves, if the process goes on long enough, lose their sweetness; they have the "tang" of alcoholic spirit in their taste, as well as the acidity which is the absence of sugar. It is not the air which hurts canned goods, but the germs that the air carries with it. When air is perfectly filtered, milk, meat, fruit—anything, no matter how delicate—may be exposed to it for a year or more, and they will not suffer any deterioration.

Decay is an analogous process. Certain germs live and grow at the expense of the substance in which they have been sowed, the substance is thrown out of chemical equilibrium, and we call it popularly "decayed," or "spoiled." An open wound offers just the nutritious garden-spot suitable for the development of certain germs, which are always in the air; they grow, taking out of the living blood some element necessary to its healthy equilibrium, and the blood becomes diseased. Nature attempts to resist this invasion, to restore the balance, and, in the attempt to throw off the diseased particles, suppuration ensues.

Carbolic acid is deadly to these germs. When it is sprayed upon an open wound, all the germs which have found their way into it are destroyed. The curative process becomes very much simplified. It is merely the healing over of torn nerves and muscles and skin. The work of nature is direct; she has no enemy with which to contend at each step in repairing damages.

The other domestic uses of carbolic acid are due to this germ-destroying power. It is used as an antiseptic in cases of typhoid fever, which is a disease of the alimentary canal, and is propagated by germs. It is applied to correct any possible invasion of sewer-gas, whose poison is due to the presence of germs. In cases of small-pox, or virulent chicken-pox, the greatest relief to the pain and soreness and irritation may be found in bathing the patient frequently in hot water with carbolic soap, and then anointing the body with a mixture of glycerine and carbolic acid in the proportions of sixty drops or a teaspoonful of glycerine to one drop of strong carbolic acid.

During the Franco-German war, a remedy in the case of wounds and certain contagious diseases was much used which is now being introduced into this country under the name of Phenol-sodique. Phenol

is only another name for carbolic acid, and this preparation is only more valuable for domestic purposes because it has a uniform and known strength, which it is impossible to get with any certainty in carbolic acid.

It must be borne in mind that carbolic acid is a violent poison from its corrosive power. In case of accident from swallowing it, olive oil, taken in large quantities, is the proper antidote.

#### To Americans Seeking New Homes.

THOUGH the times are, for the present, prosperous, the cities are nevertheless over-stocked, and so are the professions, trades, and many branches of skilled labor in them. Persons out of employment naturally look to the country, and mostly to the West, with the thought of opening up new tracts of land. We have a word of advice to such as propose to join the migrating band, whether they be lawyers or laborers, cultured or ignorant. If you are past middle age, hesitate before you leave your old home, habits, and ties too far behind you. The strain of such total disorganization of outward life kindles the energies of a young man, but tells terribly on the temper and disposition of an old one. What your boys will gain in the possession of land, they will lose in the influences of a cheerless home, and the companionships of parents over-worked, anxious, and irritable. Trust nobody in the selection of a new home. See for yourself. Examine into the soil, water, markets, business chances, etc., at whatever cost.

In packing to move, take nothing with you for purposes of show, or to impress your new neighbors with a respect for your social position. Fashion and caste are too heavy burdens to carry into a new country. If you have gentle breeding, good sense, and intelligence, be sure your virtues will find you out, and you will have your proper place given you in any community. Economize, if you must, and take a little store of ready money with you. Rainy days are many in the first year of a settler's life: crops are slow, acclimatization brings sickness.

While farming at the East is said to be suffering from the competition of the cheap lands and virgin soil of the West, it should not be forgotten that there are almost unexplored tracts waiting for the tillers in New York and Pennsylvania, to be had at comparatively low rates. Also in the Virginias and the highlands of the Carolinas, there are said to be farms and timber-land as well adapted for the growth of fruit or the cereals as any in the country. Not many years ago, a miner from the Lehigh region of Pennsylvania, tired of strikes and half-pay, put his wife, children and household goods into a wagon, and set off through the Blue Ridge district of Virginia. The family had little else than bread and water to live upon. They found a high, cool table-land in North Carolina, where the soil was rich to blackness, the water good, the climate equable. They bought a farm at fifty cents an acre, and camped down in the unbroken forest. The mountaineers helped them to raise a log-house. The next year, an energetic New Yorker bought the adjoining section. They have long had their broad fields, fruit, and comfortable homes; and a little log school-

house and church, and a post-office, which they were instrumental in erecting, have become the focus of civilization for that mountain country.

*R. H. D.*

#### Sunlight on all Sides of the House.

THERE is one subject of great importance, from a sanitary point of view, that, so far as my knowledge goes, has received little attention. Why is it that, in placing a house or plotting a Western town, village, or city, so much pains is taken, such sacrifices of local characteristics, often made, to have the street lines conform to the cardinal points of the compass? A moment's reflection would show that every building intended for a residence, if it is rectangular, should never be placed, as it almost uniformly is, so that the rooms on the southern aspect are sweltering with mid-day heat while those on the north are molding for the want of the sun's rays, but should be placed diagonally with reference to the cardinal points, or with one corner to the east to receive the sun on two sides in the

forenoon, and the diagonally opposite corner to the west, that the other two sides may get the benefit of the afternoon sun. So situated, there would be no disagreeable north side to the house, and at noon, the hottest part of the day, the sun's rays would not be beating directly upon the walls of the building. It would be excellent to plot a new town according to the same plan, since in the heat of the day there would always be a shady side to every street; also the glare toward sunset on an east and west avenue would be avoided. Perhaps tradition has something to do with the fact that nearly all new towns are laid out as they are, because, forsooth, King Solomon erected a house "north and south"; but his temple was so placed that "the sun at its meridian height could dart no rays of light into the north part thereof," as the north was considered "a place of darkness."

The advantages of sunlight in a hygienic view are very great, and the disadvantages of living on the north side are fully appreciated.

## THE WORLD'S WORK.

#### New Form of Hydrometer.

A SMALL and convenient apparatus has been recently devised for measuring the amount of moisture in the air, and finding the point or degree of temperature at which dew is formed. The hydrometer consists of a small metallic tube closed at one end with a piece of ground glass, and having a small lens at the other end. The interior of the tube is nickel-plated and highly polished. On looking through the lens, with the opposite end of the tube directed toward a bright light, the ground glass appears as a brightly lighted disc, surrounded by a bright ring. Openings are made at each end for passing the current of air to be tested through the tube. The apparatus is surrounded by a jacket for holding a cooling liquid. In using the apparatus, the current of air to be examined is drawn through it and cooled by the surrounding liquid. Dew is formed on the inside of the tube, and appears on the annular space surrounding the illuminated disc as dark colored spots. A thermometer is placed in the cooling liquid to indicate the temperature at which the dew is formed in the tube. By raising the temperature the dew is caused to disappear, and the point at which it disappears is indicated by the thermometer.

#### Improved Hand-Drill.

THE general use of power rock-drills has naturally led to efforts to produce a machine-drill that could be worked by hand. Of the new tools designed for this purpose, the latest and most promising employs a steel or rubber spring to make the manual labor available. The machine consists essentially of a drill supported by guides, a hammer designed to strike a blow upon the head of the drill, and a cam system that, under the movement of hand levers, causes the tension

of a steel or rubber spring to be applied to the handle of the hammer. The apparatus is supported by a tripod having telescopic legs, and may be set up before the rock to be drilled in any position, high or low, horizontal or vertical, at any angle that may be required. In every position the two hand levers are in convenient reach, and they are operated by simply drawing them forward and backward. Drawing the levers backward or pushing them forward moves one of the two cams in such a way that the hammer is drawn back and the spring is brought into tension. On reaching the limit of the tension of the spring it is suddenly released, bringing the whole force upon the hammer and causing it to strike a heavy blow upon the drill. The same movement, by means of a simple ratchet mechanism, causes the drill to turn on its axis a part of one revolution between each blow. The drill being supported between guides is fed up to its work by each blow, and to prevent its recoil after the blow of the hammer, set screws are provided to bind it to the guides. These set screws are intended to be fastened very lightly, so that the hammer overcomes the resistance of the screws, and yet they are tight enough to keep the drill always in place. In the machines for light quarry-work, the operator sits upon the drill, resting his feet in stirrups on the tripod, and employing his weight to keep the machine steady. In the machines examined, drill-holes were being made in micaceous granite at the rate of an inch a minute, by one man, and apparently with little labor. The holes made by the machine were remarkably smooth, even, and straight. For rapid and heavy work, where two men are employed, two springs are used and the weight of the blows struck on the drill greatly increased. Each machine may be easily moved about, or placed in position by one man, and can be folded up compactly for transportation.

**New Steam-Boiler.**

AN upright tubular boiler has been designed that presents some features of merit. It is made in two parts, a round chamber containing the grate and forming the fire-box, and a steam and water-space immediately above it. The products of combustion pass upward through this upper portion of the boiler through vertical flues that open into the smoke-stack above the boiler. This part is not essentially different from other types of upright tubular boilers. The novel feature is an annular water-space extending entirely round the ash-pit and just below the level of the grate. This water-space is connected with the boiler above by two systems of pipes placed in rings round the fire. The inner circle is next the grate, the pipes being placed close together and bent toward the center and forming a cone-shaped cage round the fire. The outer circle of pipes is upright, and placed next the outer casing of the boiler. The outer pipes, being shielded from the fire by the inner circle, are less exposed to the heat, and, consequently, the tendency of the water is downward. In the inner circle, the movement of the water is upward. By this arrangement a circulation is maintained and all sediment is deposited in the colder annular space below the fire, from which it may be easily withdrawn.

**Railway Conveniences.**

IN some railway cars recently built in New England the pressure of the air in the automatic brakes has been made of use in fire protection and in the toilet conveniences. A water-tank is placed in the end of the car under the wash-stand, and connected with the hand-basin and with the closet on the opposite side of the car. The air reservoir used to store compressed air for the brakes is connected by means of a pipe with the top of the tank. There is also a hose long enough to reach the whole length of the car attached to the tank. When the tank is filled with water, the air from the reservoir is admitted above the water in the tank. The pressure, as may be readily seen, is therefore available to force the water into the basin and closet, and through the hose in case of fire.

**New Building Material.**

THE demand for fire-proof construction in both private and public buildings has led to the introduction of a number of new methods of using ordinary building materials and the invention of new materials. The best of these have already been described here. The most recent invention is based on an improvement in making ordinary terra-cotta, and finds a useful field as a substitute for wood and brick in building walls, partitions, chimneys, floors, and roofs. The material, when finished, is a kind of soft, spongy brick. It is much lighter than any variety of brick, and is entirely free from all grit or sand. It can be cut or sawn by ordinary wood-working tools. It will hold nails, and can be treated in every respect like ordinary heavy lumber. The underlying idea of the invention is the production of a porous or, better, a spongy terra-cotta. To accomplish this, common "top" clay that is perfectly free from sand or grit of any kind is mixed with resinous sawdust and

molded by hand or machinery into slabs or bricks. When properly dried it is placed in kilns and burned. The clay is burned hard, but the sawdust minutely incorporated with it is carbonized and reduced to a fine ash. Each particle of sawdust thus leaves in the burnt clay a cell or hollow space, and the hardened terra-cotta resembles well-baked bread or a solidified sponge. The sawdust being, in bulk, equal or nearly so to the wet clay, the terra-cotta has only one-half the weight of a brick or piece of terra-cotta of the same size. The spongy texture reduces the strength, but for all purposes, except the actual laying up of lofty exterior walls, the material is strong enough. The process of making the new terra-cotta may be briefly described from an inspection of the works. The raw clay is brought directly from the clay bank and mixed by the aid of machinery with fine sawdust. Just enough fresh water is added to make the mixture work well, and it is then formed in an ordinary steam-press into slabs or pipes. The slabs are then placed in sheds, exposed to sun and wind, till dry. The peculiar texture of the material seems to prevent its warping, and in a few days it is ready for firing. The kilns are of the common "beehive" form, and as soon as the water is driven out the fires are urged till the sawdust, mixed with the clay, takes fire and is destroyed. The burning occupies about thirty hours, and the kilns are opened and the slabs, as soon as cool, are taken to the saw-mill and cut up into the dimensions required for floor-beams, between iron beams, roofing boards, partition blocks, and slabs for lining filters. Each piece is planed smooth on each side, and is squared at the edges, tongued and grooved, or cut to any shape required. For roofing, the slabs are laid on the iron rafters and the slates are nailed down upon the slabs. For partitions, the slabs are set on edge and nailed together at the corners. The material is so spongy that no lathing is required, and as the slabs are planed smooth and trimmed square, no plaster is needed, and only a thin finishing coat is put on, which dries hard and smooth in a few hours. If a door is to be cut in such a partition after it has been built, the opening is simply cut out with a saw and the trimmings nailed directly to the wall. For protecting iron columns and for covering steam-boilers and pipes, the material is formed into pipes that may be sawn in two and fitted to the pipes, columns, or other curved surfaces. For chimneys, the slabs are molded or cut into the form of long bricks that may be laid one over the other and nailed down; or, if the bricks are as long as the chimney is wide, they may be dove-tailed and fitted together, nails being used at the joints. The finished material examined was fitted into floor-beams, laid upon an iron roof, and used as a partition, having a facing of plaster (last coat only), and as plank laid on a floor, and in the rough, ready for resawing any shape, and it appeared to be admirably adapted to the work. It also makes an excellent lining for filters.

**Pocket Photometer.**

THE study and comparison of electric lights implies the use of a photometer to measure the comparative intensities of different lamps. The ordinary apparatus is available only in a laboratory, and a small photo-

meter that could be carried in the pocket would prove of value. Such an instrument has been devised and may be briefly described. It consists of a small, square box or frame open at two opposite sides and the top. The sides are covered with opal glass, care being taken to cut the glass from the same sheet, so that both pieces will be of equal translucency. On the top of the box is fitted a small telescopic tube, having a lens at the end, the whole being, of course, light-proof, except at the glass sides and the lens. Within the box are two small mirrors or two pieces of white cardboard placed at a right-angle with each other and forming a prism, the point or edge of which is opposite the lens. On holding the instrument between the two lights to be compared, each side of the prism is illuminated through the glass end; when the prism seen through the lens appears to lose its appearance of relief, or to be equally lighted on both sides, the two lights are equal at that point. By comparing the distance between the observer and the two lights, their comparative photometric value can be estimated according to the usual rules. The chief point of novelty in this apparatus is the use of the lens and telescopic tube, which makes it possible to reduce the photometer to a convenient size for the pocket.

#### Distribution of Power.

THE most recent experiments that have been made to meet the growing demand for low motive power in small shops and manufactories turn upon the familiar idea of moving air through pipes. Unlike the distribution of compressed air through pipes, the new system employs the natural pressure of the atmosphere as the direct source of power, and an exhaust, or suction air-pump, driven by a steam-engine, as the indirect source. At the central station, powerful air-pumps have been set up and provided with steam-power. Wrought-iron pipes, having rubber joints, are laid in the street to form the main, and from the main smaller lead pipes are laid into the buildings where the power is wanted. Upon each lathe, drill, sewing-machine, or other tool, is placed a small oscillating motor, connected with the tools by means of belts. Each motor stands upon a hollow cast-iron stand, or reservoir, that is connected with the air-pipe from the street. The air needed to move the motor is admitted directly, and by means of a simple stop-cock, that, in the case of a sewing-machine or lathe, can be controlled by the foot-pedal, thus leaving the hand free for the work. The admission of the air is cut off before the stroke is completed, and the air is allowed to expand in the piston. The exhaust is allowed to enter the reservoir under the motor, and is then drawn into the pipe. Oil or dust that might clog the pipes is caught in the reservoir, and can be removed as it accumulates. It will be seen that the plan is a negative one. It is not the positive transmission of power, but the creating of pressure in the cylinder of the motor by creating a vacuum at the exhaust. So far the experiments have been limited to a comparatively small space, the mains being only six hundred meters long. The mains are six centimeters (about two inches) in diameter, and the service-pipes much smaller. The power developed in the motors is low, the design being only to furnish light power for small

shops, houses, etc. The experiments already made appear to be satisfactory.

#### Novel Application of Electricity.

THE familiar chemical telegraph has been for some time almost the only useful application of the staining or discoloring effects of a current of electricity. The ribbon of paper in the chemical systems of telegraphy is saturated with certain chemicals, and when the current passes through the paper, the solution is reduced and a blue stain is made on the paper. It is now proposed to use printing-blocks in place of the needle-point used in the telegraphic instruments, and to print designs, letters, and patterns on cloth and paper by electrolysis. From the experiments already made it appears that the fabric is impregnated with a solution of aniline salt, and is then placed on a metal plate that is connected by wire with a dynamo-machine. Another plate containing the lettering or pattern in relief to be produced on the paper is also connected with the dynamo, the two plates forming a circuit. When the printing-plate is laid on the paper under some pressure the circuit is closed, and the current passes from one plate to the other through the paper, the salt is reduced, leaving a permanent stain in aniline black in the exact form of the type or pattern on the paper. By substituting a carbon pencil, held in the hand by an insulated sleeve or handle, writing in black can be traced on the paper by means of the current. This last plan is thought to be likely to prove of great value, as the markings are in indelible black, or in a number of other permanent tints. Another plan is to use engraved rolls that form a part of the electrical circuit, and to pass the fabric between them while the current is passing. By a reversal of the system bleaching has been accomplished. Fabrics dyed indigo blue or Turkey red, impregnated with a solution of saltpetre, have been bleached out white by passing them between rolls that are in an electrical circuit, or under a press having type or a raised pattern and in a circuit. Whenever the current passes, the color is destroyed, leaving the fabric white. In passing such a press the colored fabric has a pattern picked out in white upon it. The process, both in printing in black or colors, and in bleaching dyed fabrics, is believed to promise a method of producing printed, or, more properly, stained fabrics of great sharpness and clearness of design, and in new shades of color.

#### Improved Gas-burners.

THE general introduction of electric lights has naturally led to the invention of improved gas-lamps. Some of these have already been described here. The direction taken by more recent inventions is not so much toward a larger consumption of gas, or the heating of the gas and the air needed for combustion, as in the regenerative systems, but toward the incandescent system. The idea sought is to obtain, first, heat, and then, indirectly, light. A small basket or thimble of platinum wire is placed in the flame of the gas-burner, and the flame is supplied with compressed air for combustion. The result of this blow-pipe arrangement is a non-luminous flame giving great heat. The platinum thimble becomes white-hot, and this gives the

light. By another plan the supply of air is highly heated under pressure, and is then mingled with the gas and burned in the platinum thimble. This light is said to be well suited for lantern projections, the platinum taking the place of the lime cylinder of the calcium light. In another form of incandescent lamp, compressed air is driven through light hydrocarbons, as in the ordinary portable gas-machines, and the saturated air is used to heat the wire thimble. So far these lamps appear to be chiefly experimental, with a fair degree of promise for future usefulness.

#### Novel Grinding-Machine.

A new adaptation of rollers for crushing and grinding stone, ores, etc., has been brought out, that deserves mention for the ingenious arrangement of the rollers. The apparatus consists of four pairs of rollers, each pair turning independently of the others. The first pair are placed directly under the hopper, where the material is fed to the machine. The rollers are set near enough merely to crush and break up the larger lumps. Immediately under this pair is a ridge-shaped or double-inclined shoot, and the material, after passing through the first pair of rollers, falls upon this, and is delivered to the second and third pair of rollers. After passing these rollers, it falls upon a double-inclined screen. This screen is shaken rapidly, and the finer material falls through it, and the coarser pieces drop into the last pair of rollers, which are directly under the first pair. Each pair is set closer together than the preceding, and, after passing, all the material is reduced to powder. Inclosing this system of rollers

is a cylindrical screen that may be continually revolved while the rollers are at work. By this arrangement the material is continually sifted out, and falls from the machine below. Just within this screen is a cylindrical elevator, that in turning with the screen lifts, in buckets, any of the coarser lumps that may have passed the rollers, and drops them between the first pair. A casing or shield covers the whole machine to keep in the dust. The design appears to be novel and to be well carried out in the construction.

#### New Fire-Grate.

THE idea of making the fire-box of a stove, or the grate of a fire-place, rotate or turn over upon its axis, has been made the subject of experiment. A basket grate, supported on trunnions at each end, has been tried with some success, and more recently an iron fire-grate has been made that can be turned over as often as may be needed. The grate is spherical, with an opening on opposite sides, each opening being closed by a cover having perforations. The fire is built inside the grate, and the grate is filled with coal, and the cover put on. When well started, the grate may be turned over, bringing the fire on top of the fuel. When it is desired to remove the ashes, the grate is turned round quickly by means of a handle on the outside of the stove. To hasten the fire, the grate may be turned over, bringing the fire under the fuel, and to extinguish the fire, it is only necessary to close the dampers and turn the grate swiftly for a moment or two. The grate is designed to be applied to any circular stove, and appears to be an improvement on the revolving basket grate.

---

## BRIC-À-BRAC.

### To Youngsters.

GOLDEN hair and eyes of blue,—  
What wont they do?—what wont they do?  
Eyes of blue and locks of gold—  
My boy, you 'll learn before you 're old.  
The gaitered foot, the taper waist—  
Be not in haste, be not in haste;  
Before your chin sprout twenty spear,  
My word for 't, youngster, they 'll appear.

Raven hair and eyes of night  
Undo the boys; and 't serves 'em right.  
Eyes of night and raven hair,  
They 'll drive you, lad, to sheer despair.  
The drooping curl, the downward glance,  
They 're only waiting for the chance;  
At nick of time they 'll sure appear,  
Depend upon it, laddie dear.

Shapely hands and arms of snow,  
They know their charm, my boy, they know;  
Flexile wrists and fleckless hands,  
The lass that has them understands.

The cheeks that blush, the lips that smile—  
A little while, a little while—  
Before you know it, they 'll be here,  
And catch you napping, laddie dear.

Hands, and hair, and lips, and eyes,  
'T is there the tyro's danger lies.  
You 'll meet them leagued, or one by one—  
In either case the mischief 's done.  
A touch, a tress, a glance, a sigh,  
And then, my boy, good-bye—good-bye!  
God help you, youngster! keep good cheer;  
Coax on your chin to twenty spear.

*John Vance Cheney.*

### The Lamp-post on the Corner.

LET Dante tell of Heaven and Hell,  
Of meaner themes the scorner;—  
'Tis mine to sing of a modest thing,—  
The lamp-post on the corner.

Throughout the night, serene and bright,  
It stands a beacon cheery,  
To light the way of many a stray  
Belated wanderer weary.

What though the rain on every pane  
Relentlessly be beating!  
Through wet or dry the passer by  
Is certain of its greeting.  
The wind may blow the powdery snow,  
And heap the drifts together;  
But through the storm its smile is warm,  
In spite of freezing weather.

It is a guide whom none deride;  
A helper strong and steady;  
On muddy ways its kindly rays  
Are ever quick and ready.  
To hearts of fear it sendeth cheer  
Along the devious by-way,  
And puts to flight with honest light  
The robbers of the highway.

Against its waist a box is braced,  
For Love's accommodation;  
And many a scrawl therein doth fall  
With tender trepidation.  
It oft has been a go-between  
Of amiable blindness;  
And ne'er betrayed the lad or maid  
Who trusted to its kindness.

Let others write of fairies bright;  
Of marvels, signs, and wonders;  
Of feats of arms and war's alarms;  
Of Cupid's tricks and blunders:—  
But I will sing of a different thing;  
Our century's chief adorning;  
The flame of gas in its frame of glass  
Of the lamp-post on the corner.

*F. W. Clarke.*

#### Dat Yaller Gown.

DAT 's de cutes' pickaninny  
Ebber bo'n in dis heah town;  
Dey 's none sich in ole Virginny  
As him in dat yaller gown.

Yo' nebber seed a chile so kearful  
'Bout his cloze; dey's al'us clean;  
Jes' to speck 'em hurts 'im kearful,—  
De proudest' chile yo' ebber seen!

Bress his heart! Jes' heah 'im holler?  
Han'sum, aint he? Like his dad;  
De gander, now, he 's tryin' to foller;  
Down he goes! Dat makes him mad.

Jump up s pry, now, Alexander;  
Kearful! Doan ye see dat mud?  
Heah me, chile! yo 'll riz my dander,  
If ye s'ile dat bran new dud!

Stop dis instep! stop dat sprawlin'!  
Hi! yo' Alexander Brown!  
Dar 's a puddle, an' yer crawlin'  
To'ard it wid yer yaller gown!

See yo'self, now, jes a-drippin'  
Wid dat black degustful sile,  
Keeps me half de time a-strippin'  
Off yer cloze,—ye nasty chile.

Pay distenshum whan I holler!  
'Fo' de Lawd! chile, suah's yer bo'n,  
If I ebber see yo' waller  
In dat hole agin, yer gone.

Come dis way! Yes, dat's my t'ankin';—  
Nex' time look out whar ye go;  
Yer desarvin' sich a spankin'  
As yer nebber had befo'!

Aint yer 'shamed yeh good-fo'-nuffin'  
Little niggah? 'T sarved ye right,  
'Case yer al'us inter suffin'  
S'ilin', if it 's in yer sight.

Dar; now what's de good in bawlin'?  
Dat won't slick yer gown ag'in;  
Yo' *air* de *wustest* 'coon fer crawlin'  
In de mud, I ebber seen.

*Charles H. Turner.*

#### A Love-Knot.

My love and I,—when I did love my love,  
And my love loved me, ah! so very well,—  
Wandered together, and, our faith to prove,  
Cut in a tree the letters F and L.

We so adored each other, he and I,  
The very winds low whispered through the trees,  
And, breathing soft a tender, little sigh,  
Would murmur: "Where are lovers like to these?"

We were to live in Heaven while yet on earth;  
We were to scorn the gods for very joy;  
We challenged all to equal us in mirth,  
Or in the arts we learned from Cupid-boy!

We met at dawn, at noon, at fall of eve;  
We parted sobbing, but to turn again;  
We each the other could not, would not leave,—  
Pale, wan, and full of Love's enchanting pain.

To-day I chanced to walk—but quite alone—  
Married am I, and married, too, is he!  
I am the love who loved my love, and grown  
Even prettier—so, at least, it seems to me!

And he who loved his love so very well,—  
Where dwells my love, who loved his love so true?  
Oh, long ago chimed out his marriage-bell,  
And, just before it, mine had chimed out, too!

Well, I to-day was walking, when the tree  
(Which I had quite forgotten) caught my eye.  
Romantic still, I feared what I should see,—  
Romantic still, I heaved a little sigh.

But soon I gazed upon the sacred spot  
Where once our twined initials proved our faith;  
The space had closed and formed a rugged knot;  
Letters and love had died a natural death.

*Corra Linn Daniels.*

Come, Pan, and Pipe.

RONDEAU.

COME, Pan, and pipe upon the reed,  
And make the mellow music bleed,  
As once it did in days of yore,  
Along the brook's leaf-tangled shore,  
Through sylvan shade and fragrant mead.

On Hybla honey come and feed,—  
To tempt the Fauns in dance to lead  
The Dryads on the mossy floor,—  
Come, Pan, and pipe!

To-day the ghosts—Gold, Gain, and Greed,  
The world pursues with savage speed:  
Forgotten is your magic lore.  
Oh, bring it back to us once more!  
For simple, rustic song we plead:  
Come, Pan, and pipe!

*Frank Dempster Sherman.*

It's Vera Weel.

It's vera weel throughoot the day,  
When ta'en up wi' wark or play,  
To think a man can live alway  
Wi'oot a wify;

But it's anither thing, at night,  
To sit alone by can'le-light,  
Or gang till rest, when shairp winds bite,  
Wi'oot a wify.

It's vera weel when claes are new,  
To think they'll always last just so,  
And look as weel as they do noo,  
Wi'oot a wify;

But when the holes begin to show,  
The stitches rip, the buttons go,  
What in the warl's a man to do  
Wi'oot a wify?

It's vera weel when skies are clear,  
When frien's are true and lassies dear,  
To think ye'll gang through life—nae fear—  
Wi'oot a wify;

But clouds will come the skies athart,  
Lassies will marry, frien's maun part;  
Wha then can cheer your saddened heart  
Like a dear wify?

It's vera weel when young and hale:—  
But when ye're auld, and crazed, and frail,  
And your blithe spirits 'gin to fail,  
Ye'll want a wify;

But mayhap then the lassies dear  
Will treat your offers wi' a sneer;  
Because ye're cranky, gray, and sere,  
Ye'll get nae wify.

Then haste ye, haste, ye silly loon;  
Rise up and seek aboot the toon,  
And get Heaven's greatest earthly boon—  
A wee bit wify.

*Wallace Dunbar.*

To my Dog "Dick," Lost at Sea.

"The whole creation groaneth."—*St. Paul.*  
"For they, too (the brutes), are immortal."—*John Wesley.*

I LOVE the kindly faith of him who preached  
That God's inferior creatures live again;  
And some high life, by toil or suffering reached,  
Survives, in peace, this lower life of pain;  
And so, my dear old dog, perchance thy gain  
Grew from my loss when thou wast reft from me,  
By the relentless Fates untimely slain,  
Gasping thy soul out in the cruel sea;  
For soul thou hadst (I care not for the sneer  
Of tenuous wits), nay, more, thou hadst a heart,—  
Brave, faithful, kindly, loving, and sincere;  
And, though we find not, on our vital chart,  
By any reckoning, where the region lies,  
Be thine, my dog, the Good Dog's Paradise.

*A. J. W. McNeily.*

Thelga and Ethred.

SESTINA.

[The sestina is the most complicated and difficult of all the old Provencal forms of verse. It is believed that the one below is the only one ever written in America, and the second of its kind in the English language, Mr. Edmund W. Gosse having published the first. There is also a rhyming sestina by Mr. Swinburne.]

ONCE on a time there dwelt Siehild, a king,  
Far to the Northward, in the icy heart  
Of barren peaks that lift their heads to kiss,  
All passionless, the sun, their senile love;  
Rich booty from the merchant seas he won,  
And with a despot's scepter ruled the land.

She who was famed as fairest in the land,  
Was Princess Thelga, daughter of the king,  
Prized by him more than all the spoils he won.  
Gentle and proud, till Ethred came, her heart  
Had never felt the stir of nestled love,  
Her lips ne'er known the spasm of love's kiss.

And old Siehild had sworn that such a kiss—  
By all the treasures of the sea or land!—  
Should never consecrate his daughter's love  
For any suitor save the blustering king  
Who ruled the realm adjoining, and whose heart  
Chaste Thelga all unwillingly had won.

Hers Ethred, young and powerless, had won,  
Unnoted by Siehild until a kiss  
The tyrant caught him stealing:—then his heart  
O'erran with rage that one with goods nor land  
Should dare to woo the daughter of a king,  
And balk a brother monarch of his love.

"Now, by my ships!" he stormed, "thou sayst thy  
love  
By this unfilial damsel has been won;  
I'll prove you then: If you can tell your king  
Of aught, ha! ha! that's sweeter than the kiss  
You gave her, dowered with goods and land  
Her hand is yours, as is, she thinks, her heart!"

"I can!" and Thelga pressed her angered heart  
As Ethred spoke. "Then," roared the king, "your love  
Is false if aught's more sweet, in all the land!"  
"Nay," Ethred said, "I claim that I have won:  
*Sweeter than that I gave her was the kiss  
She gave to me!*" "I yield!" confessed the king.

Ah, happy heart! the royal largess won  
Of voluntary Love, in its one kiss,  
Is more than sea or land can give a king.

*Harrison Robertson.*

## Aphorisms from the Quarters.

NIGGER sleep warm ef his head kivered up.  
Norf wind show you de cracks in de house.  
When you make de jail too nice, you better strenkin'  
de hog-pen.

Mule don't kick 'cordin' to no rule.  
Black sheep hide mighty easy in de dark.  
Sun trabble slow 'cross de new-groun's.  
Better keep de rockin'-cheer in de cabin lof' tell  
Sunday.

You can't coax de mornin'-glory to clam de wrong  
way 'round de corn-stalk.

Sat'day night he'p de roomatiz pow'ful.  
High-larnt nigger aint much service at de log-rollin'.  
Blind bridle can't hide de fodder-stack fum de lean  
horse.

Corn-cob stopper don't hu't de lasses in de jug.  
Hot sun make de blades dull in de harves'-fiel'.  
Mule don't unnerstan' de wheelborrer.  
Smart rabbit go home 'fo' de snow done fallin'.  
Dead limb on de tree show itse'f when de buds  
come out.

De new groun's is de bes' yard-stick to medjer a  
strange nigger by.

Dribin' de steers wid mule-talk is flingin' 'way  
your bref.

Tin plate don't mind drappin' on de flo'.  
Cussin' de weather is mighty po' farmin'.  
De preacher need heap mo' grace when he won't  
pray for rain tell de wind git right.

It takes heap o' licks to drike a nail in de dark.  
Good signs o' rain don't always he'p de young crap.  
Books don't tell when de bee-martin an' de chicken-  
hawk fell out.

Don't take too big a chip on a saplin'.  
De public road aint free for de rattlesnake.  
De plow-p'int is close kin to de meal-bag.  
Dar's some fac's in de wul' dat don't slide 'long on  
de telegraph-wire.

Don't set on your load o' straw to make it little and  
light.

Cross-roads bad place to tell secrets.  
De mole an' de fishin'-wum don't keer ef de sky  
git cloudy.

Thin wheat he'p de harves'-song powerful.  
What you kin l'arn by boxin' wid a left-handed  
nigger cos' mo' 'an it come to.

When de fros' sen' you wud by de norf wind, you  
better git in de punkins.

Tree-frog kin see de rain fur orf as de olmanick.  
De yaller-jacket nes' is a mighty lonesome neigh-  
borhood.

Wum don't see nuffin pretty in de robin's song.  
Green 'simmons mighty safe, day and night.

J. A. Macon.

## A Reminiscence.

'Twas on a glowing summer morn,  
In a cool chalet on the Scheideck,  
Her father, on an Alpine horn,  
Blew with puffed cheeks, shut eyes, and wry neck.

Her snow-white sleeves were neatly starched;  
Her dowry chains bedecked her bodice;  
Her short skirt showed an instep arched,  
An ankle fit to bear a goddess.

She watched the goats (from upper heights  
Their bells ting-tanged)—she and the Hündchen;  
She knitted in the winter nights,  
And had been, once, as far as München.

Puzzling, to me, her *patois* sweet;  
All Greek, to her, my foreign phrasing;  
But pantomime is quite complete  
Enough, when one finds bliss in gazing.

She gave the edelweiss I keep—  
When, suddenly, an August flurry  
Of tempest darkened o'er the steep,  
And warned me to the vale to hurry!

One kiss I stole, as her soft face  
She coyly drooped—the mountain Hebe!  
\* \* \* I wonder if, in the old place,  
The hut still stands—if wedded she be!

C. E. S.

## A Lost Child.

Ye CRYER:

*Here's a reward for who'll find Love!*  
*Love is a-straying*  
*Ever since Maying,*  
*Hither and yon, below, above,*  
*All are seeking Love!*

Ye HAND-BILL:

*Gone astray*—between the Maying  
And the gathering of the hay,  
Love, an urchin ever playing—  
Folk are warned against his play.

How may you know him? By the quiver,  
By the bow he's wont to bear.  
First on your left there comes a shiver,  
Then a twinge—the arrow's there.

By his eye of pansy color,  
Deep as wounds he dealeth iree;  
If its hue have faded duller,  
'T is not that he weeps for me.

By the smile that curls his mouthlet;  
By the mockery of his sigh;  
By his breath, a spicy South, let  
Slip his lips of roses by.

By the devil in his dimple;  
By his lies that sound so true;  
By his shaft-sting, that no simple  
Ever culled will heal for you.

By his beckonings that embolden;  
By his quick withdrawals then;  
By his flying hair, a golden  
Light to lure the feet of men.

By the breast where ne'er a hurt 'll  
Rankle 'neath his kerchief hid—  
*What? you cry; he wore a kirtle?*  
Faith! methinks the rascal did!

*Here's a reward for who'll find Love!*  
*Love is a-straying*  
*Ever since Maying;*  
*Hither and yon, below, above,*  
*I am seeking Love.*

## HYDRAULIC MINING IN CALIFORNIA.

HYDRAULIC mining is the modern method of working deep auriferous gravel deposits in California. It is regarded as a California industry,\* deriving its origin and growth from the peculiarities of the auriferous placer-formations in the State. Strictly speaking, however, it is simply the perfect development of the earlier form of placer-mining, as illustrated in the cradle or rocker. The rocker is the rudest and simplest of all machines employed for the separation of gold from the gravel through which it is distributed; but it embodies in a small way, nevertheless, all the essential features of the more elaborate machinery used in other forms of placer-mining, the hydraulic method included. The cradle is an oblong box about four feet in length, mounted on a pair of transverse rockers, and furnished with a set of graded sieves laid in tiers, "riffles," amalgamated plates, and blankets for the separation and arrest of the gold in its descent from the hopper into which the auriferous gravel is placed, to the outlet at the lower end. These devices are all present in hydraulic mining, but they are so enlarged as to be almost unrecognizable. Cradling represents a minimum service of water in gold placer-mining, joined to a maximum service of manual labor; the hydraulic method represents the maximum service of water united with the minimum of human exertion. For all that, the cradle is still in use on river bars and other places where an absence of grade makes any other form of washing auriferous gravel impossible. Such diggings, and the cradle with them, have passed almost entirely into the hands of the Chinese.

The advancement of placer-mining from

\* Pliny (Bohn's translation, Volume VI.) describes a system of hydraulic mines in Spain which resembled, in many respects, the modern method in California.

the puny cradle to the powerful "monitor" which is now used in hydraulic mines to tear down and wash off the high banks of gold-bearing gravel, was accomplished by easy grades. The various stages of development are represented in the "long tom," "sluicing," and "ground-sluicing." The "long tom" was a box, shaped very much like an open coffin with the foot knocked off, the bottom of which was lined with riffles running parallel with the sides. Into this box the gold-bearing earth was dumped, and a stream of water was turned on at the head, while the "pay dirt" was well stirred with a sluice-fork. The stream of water served a double purpose: it released the gold contained in the dirt, which of its own gravity dropped between the riffles, and it washed off the lighter earth and gravel. The coarser gravel was carefully washed and thrown out with the sluice-fork. The escape of the finer gold at the mouth of the long tom made it necessary to add other long and narrow boxes to the lower end of the long tom, much after the manner of an ordinary flume. Riffles were placed in these boxes also for the purpose of arresting the particles of fine gold as they rolled with the stream. This flume was called the "sluice." The "ground-sluice" consisted of making the bed-rock on which the "pay dirt" rested perform the duty of sluices, the stream of water used for washing away the dirt being constantly trained against the bank. The action of the water was precisely the same as that performed by any stream against its natural banks where they happen to offer resistance to the current. The miner assisted the flowing water by a judicious use of his pick. Where the conditions were favorable, "ground-sluicing" was a great improvement on all other methods, inasmuch as a much larger quantity of "pay

dirt" was removed with the same amount of water and manual labor.

The discovery of gold distributed throughout the deep gravel deposits on the high banks of the cañons of the streams in which gold had before been found, suggested the employment of water under pressure to mine it. This was accomplished by the conveyance of a stream of water, in ditches and flumes, from a convenient source to a point above the gold-bearing gravel-bank to be operated upon. It was then led to the base of the bank in pipes, and discharged against it through a small nozzle. Thus the hydraulic method of placer-mining was brought into

use. The hydraulic apparatus consisted of a wooden hopper or cistern, V-shaped, strengthened with cumbersome wooden clamps and suspended on scaffolding in such a position as to receive the discharge from the supply-ditch. To the lower and smaller end of the hopper was attached a hose made of ordinary sail-cloth, and having a diameter of six or eight inches. This hose conveyed the water down the hill-side to the workings. The nozzle through which the stream was discharged had an aperture of one or two inches diameter, and was screwed to the end of a tapering copper or brass pipe attached to the hose, resembling very much the pipes used by firemen. The

THE SLUICE.

flexibility of the hose enabled the miner to direct the stream to any point on the gravel-bank he desired.

The evolution of hydraulic pipes from sail-cloth, through leather and rubber, to iron, was easy. But the transition of the discharge-pipe to the "monitor" of the present day did not occur for years afterward. Since the employment of iron, the pipes have been gradually enlarged and strengthened, and the volume of water and the pressure have been increased, until now pipes from fifteen to thirty inches in diameter, like the water-mains of a great city, may be seen winding through a hydraulic mine. These pipes terminate in monitors, each discharging a gleaming shaft of water so powerful as to toss about rocks, tons in

use. The best authorities agree in stating that it was introduced about 1856.

In the earlier history of hydraulic mining one hundred miner's inches of water was considered a full head. It is usual to consider a miner's inch as the quantity of water which will pass through an aperture one inch square, under a pressure of about six inches; that is, the stream issues from a box in which the water stands at a constant level of six inches above the upper edge of the aperture. According to different authorities, a miner's inch, flowing steadily for twenty-four hours, is estimated to equal from 2230 to 2274 cubic feet, or 17,000 gallons of water. One hundred miner's inches would thus represent in twenty-four hours 1,700,000 gallons. The hy-

weight, as if they were mere pebbles. The volume of water supplied to a monitor has increased to one thousand and even fifteen hundred miner's inches, and the pressure ranges from two hundred and fifty to four hundred feet. One thousand miner's inches thus discharged through the nozzle of a monitor is estimated to represent a natural flow of fifteen hundred and seventy cubic feet per minute.

The hydraulic monitor was first used, according to good authority, in 1865. But it was not until a much later date—in 1869 or 1870—that it came into anything like general use. It resembles nothing so much as it does a piece of military or naval ordnance. It is united to the supply-pipe at the breech with a water-tight socket-joint, which is a good substitute for flexibility, as it enables the miner to direct the nozzle in any direction. It is nicely ballasted with a carriage extending backward from the breech and loaded with rocks. It is operated by a very simple and effective arrangement, called a "deflector," and consisting of a sleeve of sheet-iron working on an elbow-joint over the nozzle. To this sleeve is riveted an iron handle four or five feet long, by means of which the "deflector" may be moved so that the lip shall impinge on the column of water emerging from the nozzle of the monitor. An angle is thus formed in the shaft of water. It is so trifling as to be imperceptible to the eye, but

THE CRADLE.

it is enough to affect the monitor, which slowly moves in the opposite direction, so as to relieve the friction and straighten the line of discharge. With the aid of this simple apparatus a child could change the direction of the stream thrown by the largest monitor in use. Without the "deflector" it

would be a difficult and hazardous undertaking for a half-dozen strong men to attempt the operation.

The deep placers of California extend through seventeen counties lying on the west flank of the Sierra Nevada, and are traceable for three hundred or four hundred miles. Their continuity within well-defined channels, having a grade varying from twenty to three hundred feet per

THE MONITOR.

mile, has given rise to the conviction that they constitute the débris of an ancient system of rivers. This auriferous débris consists largely of eroded slate and quartz. The deposit varies in thickness from one hundred to one thousand feet. In many places it is overlaid with a stratum of lava which was undoubtedly emitted by Mt. Shasta and other now extinct volcanoes in its neighborhood, during a period of great volcanic activity which succeeded the geological period when the auriferous gravel deposit was formed. Evidences of this great lava flow are to be found all over Northern California and Oregon. In some of the counties in which the gold-bearing placers exist, the stratum of lava overlying them is so thick that the only way in which they can be worked is by the drift or vein process of mining. Hydraulic mining is confined chiefly to the counties of Nevada, El Dorado, Placer, Yuba, and Butte, where large portions of the lava-sheet is so thin that it offers little or no obstacle to the process. There are also some large hydraulic mines in Plumas, Calaveras, and Stanislaus counties. It is not necessary to discuss the question of the agency which formed the deep gravel deposits,—whether it was ice or water. They may belong to that glacial epoch which John Muir, the California geologist, has so graphically described as having sculptured the Sierra and grooved the Yosemite out of the solid granite.\* They probably belong to an epoch when ice and water were more active than now, for there are some things about them which cannot very well be ascribed to either one of these two agents. But, whatever agent formed them, the course of these dead rivers was different from that of the present streams. Deep cañons through which the streams of the present day flow intersect the ancient riverbeds in many places. Gaps have, consequently, being formed in the ancient river-channels. The material washed out of these gaps, being reduced and concentrated by the modern streams, formed the source of the gold obtained by "the Argonauts of '49." They also exposed those portions of the channels of the ancient rivers which had not been disturbed since the time of their interment. Nor does the grade of the ancient channels correspond with that of the present streams. Near Marysville, the ancient channel dips into the plain below sea-level; forty miles off—at North Columbia—it stands about one thousand feet above the bed of the Forks of the Yuba, and it ultimately attains an altitude of two thousand feet above the modern channel. An artesian well sunk at

Stockton, San Joaquin County, penetrated the same gravel formation at a depth of one thousand feet below the surface. From workings extending over a distance varying from

DISTRIBUTING-RESERVOIR—TURNING ON THE WATER.

one-half mile to four miles in continuous length along these ancient channels, it has been found that they yield from one thousand dollars to two thousand five hundred dollars per lineal foot. Wherever these ancient riverbeds are situated on a plain high enough for the purpose, and are comparatively free from lava, there hydraulic mining will be found.

The heart of the hydraulic mining district is in what is popularly called "The Yuba Ridge." "The Ridge" is an elevated spur of the Sierra Nevada thrust into the Sacramento basin through Nevada and Yuba counties. It lies chiefly within the boundaries of Nevada County. Incidentally it may be noted that "The Ridge" is a section of special interest, for it was along its summit that the overland emigration of Argonauts entered the Sacramento Valley. The old emigrant trail enters the State and "The Ridge" at Emigrant Gap,—a locality on the line of the Central Pacific railroad familiar to those who have traveled overland to or from California, and near the head-waters of the South Yuba and Bear rivers. The old trail may be traced along the summit of "The Ridge" at the present time. Even the trees around which the overland emigrants slipped their ropes in letting their loaded wagons down the steep grades are still standing. The main

\* See "The Glacier Meadows of the Sierra," in this magazine for February, 1879.

arteries of the ancient river system coursed along "The Ridge." At present the three branches of Yuba River, known respectively as North Fork, Middle Fork, and South Fork, drain "The Ridge." In whatever direction the eye is turned, when on "The Ridge," evidences of the presence of the hydraulic miner are presented, either in the form of a desolate waste of tailings, mammoth excavations in the flanks of the pine-clad and round-topped hills, or in the lines of ditches and flumes winding along the summit of the range or clinging from the precipitous sides of the cañons and conveying water from far-off mountain-reservoirs to the mines.

A hydraulic mine is simply an open cut of huge dimensions excavated in the deep gravel deposits. Sometimes this is accomplished without difficulty from the side of the cañon forming the bed of the modern stream, or through the agency of a conveniently situated ravine. But, in many cases, the rim-rock of the ancient river-bed intervenes between the auriferous deposit and the cañon which the hydraulic miner desires to use as a "dump" or depository for the "tailings" or *débris* of his sluices. To reach the deepest place in the dead river-channel, long tunnels are frequently necessary. The North Bloomfield Mining Company, for instance, in one part of the claim, had to bore a tunnel eight thousand feet in length before the bottom of the auriferous gravel deposit was drained, and a branch tunnel nine hundred feet farther before another part of the company's ground was so drained that it could be effectively worked by the hydraulic process. The original tunnel and its three air-shafts cost the company two million dollars; the branch tunnel was proportionately costly. All the water used in the mine, and all the material removed, passes through this tunnel into the cañon of the South Fork of the Yuba. Such a hydraulic mine looks like an enormous basin hollowed out of the mountain side. Many of the principal hydraulic mines on "The Yuba Ridge" are of this order.

The character of the gravel formation is shown to great advantage in a hydraulic mine. The upper stratum, for a depth of one hundred feet or so, is loose and friable, and of a rusty color, which is caused, no doubt, by the oxidation of iron pyrites, of which the lower stratification is full. The process of oxidation is no doubt facilitated by the percolation of surface-water through the gravel. The lower stratum of gravel is denser, well cemented, coarser, and of a bluish color. Owing to this latter feature, it is called by miners "blue gravel," and, because of the greater proportion of gold found in it, the

term "pay dirt" is also applied to it. Occasionally a stratum of pipe-clay will intrude between the upper and lower strata of gravel, and a layer of gravel varying in thickness almost invariably overlies everything. The gravel deposit is rich in vegetable fossils and curious petrifications. Trunks of sugar-pine, manzanita, and other forest-trees and shrubbery, converted into solid stone, are abundant. Fossil leaves and ferns are plentiful in the pipe-clay, and the foot-prints of birds are numerous in the same formation. Here, then, are evidences of vegetable growth during the formation of these deep placers, which is identical with, and quite as rank as, that which now exists. Who shall interpret the testimony of the deep placers of California? The great openings formed in them by the hydraulic miner furnish the enterprising and intelligent geologist a rare opportunity, which, thus far, has been almost entirely neglected. The only attempt worthy of mention is that of Professor J. D. Whitney's monograph of the deep placers of California, published at Cambridge, Mass. One thing is, however, certain: It was after the great lava flow which overran the State of Oregon and Northern California that the present water-courses were carved out, not only carrying off, in the course of erosion, the lava-cap and gravel deposits, but also grinding

CLEARING UP A TUNNEL.

down the country rock, in some places, two thousand feet deeper than the beds of the dead rivers.

The mode of working a hydraulic mine is very simple. From the distributing-reservoir

HEAD OF FLUME.

—a large artificial lake in the vicinity of the mine, but situated at a much higher elevation—the water is conveyed in ditches and large iron pipes, fifteen, twenty-two, or thirty inches, in diameter, to the monitors. The gravel removed by the stream is led through the ground-slucies into the deep open cuts that have been excavated with powder and pick in the solid bed-rock. These open cuts are from fifteen to forty feet (and sometimes even more) in depth, and from four to six feet in width. They discharge into the tunnel excavated through the rim-rock, and the débris is then delivered to a system of sluices and “under-currents,” by which it is expelled at “the dump.” Great care is taken to prevent the escape of the gold with the outpouring flood and débris. The tunnels and open cuts are paved with heavy boulders or heavy blocks of wood, which pavement has to be frequently renewed, owing to the enormous attrition to which it is subjected. The sluices and under-currents are paved with wooden blocks a foot thick and eighteen or twenty inches in diameter, the end of the fiber of which is presented to the action of the flowing water and débris. Every few weeks these blocks are so far worn that new ones have to be substituted. The forest-timber growing on the surface of a hydraulic mine is, consequently, rapidly destroyed

to supply blocks for riffing. In the spaces between the boulder and block pavements the gold finds a lodgment.

The under-currents are a very useful and ingenious device to utilize the immense fall between the mouth of the tunnel and the bottom of the cañon into which the tailings are dumped. Without them miles of sluices would have to be constructed and maintained at great expense, and the separation of the gold from the gravel would even then scarcely be as thorough. The under-currents are a system of zigzag sluices placed underneath one another, at distances of forty or fifty feet apart. The under-current may be briefly described as follows: The sluice emerging from the tunnel is run out on scaffolding a few feet over the steep side of the cañon. At the end of the sluice, and forming a part of the bottom thereof, is a large and strong iron grating, called the “grizzly,” over which the greater part of the water and the coarser débris are projected by their own momentum, falling a sheer distance of forty or fifty feet, where they are taken up and carried forward by another sim-

ilar set of sluices, to be again discharged in the same way. Through the grating, or grizzly, at the end of each of these sluices, the gold which has traveled thus far, the finer gravel, and a small volume of water drop on to a broad table placed underneath and riffled with blocks. Over this broad table the light material and gold are carried at a greatly reduced speed. The gold drops of its own gravity into the spaces between the blocks, which have been charged with quicksilver, while the water passes off and joins the main stream at the foot of the falls, carrying with it the fine débris. Six or seven of these under-currents suffice to separate the gold thoroughly from the gravel, and the lower under-current in the chain barely pays the cost of maintaining it. One man is constantly employed watching the under-currents and keeping the dump clear at the foot. A jam, which sometimes occurs through the stoppage of tree-stumps or large boulders, turns the stream, freighted with its precious burden, on a wayward course. The watchman must, consequently, be vigilant, active, brave, and energetic. He is usually a broad-shouldered giant, with a quick eye, sinews of steel, and plenty of nerve. He is armed with a rifle, to shoot down any thief that may attempt to rob the sluices. The sluice-

robber usually is a Chinaman. His latest method of sluice-robbing is to supply himself with a silver knife, and when an opportunity is presented by the watchman turning

worked by one man. He has been selected for his superior skill in the management of the machine, and the excellence of his judgment in the use of water. He is known as

CLEARING UP UNDER-CURRENTS.

his back for a few minutes, to thrust the blade of the knife between the riffles of the under-current. Quicksilver having an affinity for silver, the blade comes up covered with auriferous amalgam. A sentry-box on the brow of the hill is the watchman's tower. From it he commands an unobstructed view of every foot of the under-currents, and of the tail-dump down to the river below. Woe betide the sluice-robbler he may detect pursuing the nefarious calling!

Each monitor in a hydraulic mine is  
VOL. XXV.—30.

the "pipeman," and is, next to the foreman or superintendent, the most important man in the mine. A competent pipeman will work off twice as much gravel as an ordinary miner can do with the same machine in a given time. In the pipeman's hands the monitor is always engaged in the most effective work, and the sluices are kept full to the brim with moving material. Immense blasts of powder have previously loosened the bank so that it dissolves with great rapidity under the influence of the streams of

MONITORS AT WORK ON TERRACES.

of water thrown upon it by the monitors. In the preparation of these blasts a narrow and low drift or passage-way, one hundred feet in length, is run into the bank along the bed-rock at its base. At the inner end of this drift a cross-drift of equal length is excavated. When ready to receive the charge of powder, these underground workings are in the form of the letter T, with chambers at the extremities of the cross-drifts. Kegs of black powder, are then packed in by the ton,—as much as thirty-five tons forming one charge. Telegraph wires connect the mine with an electric battery stationed at a safe distance. After the outer drift has been securely closed up, the mine is sprung, and a bank, containing half a million tons or more of gravel, is lifted and loosened as if by a mighty convulsion of nature. Masses of rock too large to pass through the sluices and under-currents (and the blue gravel is full of them) are also broken up by charges of powder. Sometimes masses of cemented gravel, not affected by the main blast, have to be broken up in a similar manner. Drift-miners are, consequently, constantly at work in a hydraulic mine, and powder forms a considerable item in the current expenses. The powder bills of some hydraulic mining companies

run from thirty-five thousand to fifty thousand dollars per annum. On the top of the embankment, and commanding a good view of the face of the workings, watchmen are stationed in large wooden boxes, to signal the workmen below that there is danger from sliding banks. The distributing reservoirs and the mine are connected by telephone, and a telephone or telegraph line also connects the distributing reservoir with the head of the supply-ditch and main reservoir, forty or fifty, or even one hundred miles away.

Hydraulic mining has given birth to an extensive system of artificial reservoirs in the Sierra for the storage of water, and to the construction of artificial water-courses to convey the water thus stored to the scene of mining operations. Were it not for these reservoirs, the hydraulic miner would be able to work only a small portion of the year. The natural streams fail in the early part of July, and they continue low until the melting of the snow in the following spring. With the artificial reservoirs built by the hydraulic miner in the high Sierra, he is able to continue his work almost the year

round, except when frost seals up his ditches. The visitor finds difficulty in believing that the white shaft of water which he sees emerge from the muzzle of the monitor at work has been carried along precipitous cliffs, over deep gorges, and along the flanks of Sierra spurs, a distance of fifty or more miles, and that the source is an artificial lake created by the miner's means and industry in some high Sierra valley, possibly at an elevation of six or eight thousand feet above sea-level. The canals carrying the water have a grade of from four to twenty feet per mile, and carry a volume of two thousand to four thousand miner's inches.

The hydraulic mining-ditches are wonderful specimens of engineering skill. In many places it is impossible to find room along the precipitous sides of the great cañons, for miles, to excavate a canal or rest a flume. In such places the flumes are literally hung to the cliffs. The Miocene Mine has a flume carrying three thousand miner's inches of water, suspended by iron slings and brackets from the face of the perpendicular cliff. The Blue Tent Mining Company's ditch, which carries just as great a volume of water, runs a distance of six miles along the face of a cliff over which the surveyors had to be sus-

MONITOR AT WORK ON BED-ROCK.

pended by ropes a thousand feet above the bottom of the gorge, to establish the line of the flume. In other places deep gorges are crossed by means of inverted syphons. The Spring Valley Company's Cherokee ditch crosses the cañon of one of the branches of the Feather River in this way. The pipe sustains a columnar pressure equal to eight hundred feet in perpendicular height, and twelve thousand feet of thirty-inch iron pipe, three-eighths of an inch in thickness, is used in making the crossing. This is an engineering feat without its parallel in the world. Before it was undertaken, the most eminent English and French engineers pronounced it impracticable, considering the cost of construction. It is estimated that there are six thousand miles of mining-ditches in the State, which have cost a total of \$15,000,000. Some of them have been built at an expense of \$25,000 per mile. The canals of the South Yuba Canal Company are one hundred and fifty miles in length, and cost over \$1,700,000. Twenty-four and one-half miles of the El Dorado and Deep Gravel Mining Company's ditch cost nearly \$700,000. Mining-ditches cost, to keep in order, from three to three and one-half cents per inch of water. The expense is due to land and snow slides, falling trees, lodgment of snow, frost, and the employment of watchmen and gate-tenders. The hydraulic miner has to maintain a ceaseless contest with the elements,—frost and flood, ice, snow,

wind, and rain. It is estimated that at least \$100,000,000 is represented in the capital stock of hydraulic mining property in Cali-

AN AVALANCHE OF SNOW DESTROYING A FLUME.

FLUME CROSSING A VALLEY.

foria, a large portion of which has been expended in the construction of tunnels, ditches, flumes, and reservoirs. The hydraulic miner's ditches and flumes are, of course,

employed in diverting the streams from their natural channels. In older countries, where law and custom establish what is known as riparian rights, such a diversion would be impossible. The location and other peculiarities pertaining to the working of the deep gravel deposits of California made it necessary so to divert the streams. What was at first the custom, was subsequently recognized by the law, special acts of the legislature being passed granting the hydraulic mining companies water-privileges unknown in other countries.

After heavy snow-storms, the flumes are choked and often destroyed by the snow-slides. The miners and ditch-tenders are sent along the flumes to keep the snow moving along with the water; but this is necessarily a work of considerable danger, as the snow gathers in enormous quantities upon the mountain sides, causing avalanches that sweep all before them, often destroying in an instant hundreds of feet of the flume. In case of an accident of this kind, the first wastegate above the break is opened, and the water is allowed to run off till the gate at the head of the flume can be shut. Owing to the watchfulness of the flume-tenders, fatal accidents seldom occur, but uncomfortably narrow escapes are very common. The ditch-tenders are stationed every five or six miles along

FLUMES PASSING AROUND CAPE HORN.

the flume, and are always on duty. They have a large float in the ditch, to which a rope is attached. The rope passes through a pulley and into the small station-house, where it supports a shelf, upon which are placed all the tinware and iron pots. In case of a break in the night, the float drops, and so does all the tinware, awakening the attendant, who runs out, opens the waste-gate, and then proceeds along the ditch to the next station or the place of accident.

The construction of a hydraulic mine reservoir is no mean undertaking. It involves a vast amount of labor and expense. Suitable valleys are selected for the purpose, near the summit of the Sierra, and almost within the line of perpetual snow. Such valleys are abundant. Huge dams of solid masonry are built across the gorges at the mouths of the valleys selected. The melting snows on the surrounding water-shed supply such a reservoir with water. Water which would otherwise escape into the beds of the natural streams, and be carried off with the spring floods materially increasing them, is thus stored until the natural streams have dried up, or run down so low that they are no longer of any service to the hydraulic miner. The Fordyce reservoir is the largest artificial lake in the Sierra. The dam is ninety feet at the base, which lies on the solid granite; it is seventy feet high and is six feet thick at the top. The inner slope has a rise of one in one, and the outer slope has a rise of five in one. Both slopes are made of dressed granite blocks carefully laid. On the inner slope stringers twelve inches by twelve inches are laid close together, and then covered with three-inch planking. The whole structure is bolted firmly together, and to the rock on which its foundation stands. Every precaution which the best hydraulic engineering skill can suggest is thus employed to make these mining-reservoirs permanently secure. Each dam is equipped with suitable weirs for the escape of overflow, with sluice-gates, etc. The Bowman or Big Cañon reservoir is, next to the Fordyce, the largest of these artificial mining lakes. It covers a mountain valley five thousand four hundred and fifty feet above sea-level, of an area of five hundred and thirty acres, formerly owned by a man named Bowman. Mr. Bowman was also the keeper of an overland stage station situated in the center of the valley. At present a few feet of the tall flag-staff of this stage station sticks out of the water. This reservoir was formed by the construction of just such a dam as has been described, only it is ninety-six feet high. English Reservoir, belonging to the Milton Company, has a dam eighty-

WASTE-GATES IN A FLUME.

seven feet high, and covers an area of four hundred acres. Silver Lake is an enlarged natural lake, and covers about one thousand two hundred acres. In the construction of these mountain reservoirs no effort is made to remove the timber growing within the valley to be inundated. The great forest-

trees are left standing, and when the waters rise well up to their upper branches they soon wither and die. It is a curious sight to see this dead timber rising out of the clear water.

The storage capacity of artificial reservoirs constructed by those engaged in hydraulic

ous earth that can be washed off within a given time, the smaller is the percentage of gold necessary to make it pay. As a rule, the gold is distributed through the deep gravel deposit. The coarser and larger quantity of gold is found on or near the bed-rock in the blue stratum. The gold found in the top dirt

BIG CAÑON DAM, FORMING AN ARTIFICIAL LAKE ELEVEN MILES IN CIRCUMFERENCE.

mining in California is estimated at 7,600,000,000 cubic feet. The reservoirs of the South Yuba Hydraulic Mining Company have a storage capacity of 1,800,000,000 cubic feet. The Eureka Lake Hydraulic Mining Company's artificial reservoirs have a storage capacity of 1,130,000,000 cubic feet; those of the North Bloomfield Company, 1,050,000,000; the El Dorado and Deep Gravel Mining Company, 1,070,000,000; the Milton Company, 650,000,000; the California Water Company, 600,000,000; the Spring Valley, 300,000,000; the Omega and Blue Tent (united), 300,000,000 cubic feet.

The value and success of the working of a hydraulic mine depends principally upon the volume of water at command. It is astonishing what a small percentage of gold contained in a gravel-bank will yield a profit where abundance of water can be brought to bear upon it. The greater the quantity of aurifer-

ous ground is estimated by the quantity of gold it contains per cubic yard. Whether it will pay to remove it by the hydraulic process must be determined by the cost of water, powder, and labor per cubic yard. For instance: In the North Bloomfield mine, water costs .0755 of a cent per cubic yard of gravel moved, and labor two and one-fourth cents, making a total expense of three cents to remove each cubic yard of gravel. Consequently, it will pay to wash off all gravel containing upward of three cents' worth of gold per cubic yard. An average of the yield of six prominent hydraulic mines during two seasons' work shows only seven and one-fourth cents per cubic yard. But, when it is understood that a twenty-four-hours miner's inch of water—that is, a stream of one miner's inch discharged uninterruptedly during the twenty-four hours by the monitor—is estimated to remove from

two to four and one-half cubic yards of auriferous gravel, according to locality, and that the monitors may be discharging an aggregate volume of 6,000 miner's inches,—equal to 102,000,000 gallons in twenty-four hours, a larger volume than is needed to supply the wants of the city of London,—the significance of this small average yield per cubic yard will be fully appreciated. For instance, on Auburn Ravine and Rossville Creek, where the volume of water is not large and the gravel deposits are shallow, the minimum service of two cubic yards per miner's inch is obtained; on Bear River, the average is three cubic yards, and, on the American River, four and one-half cubic yards. Computing by the water used, Blue Tent mine yielded from sixty to eighty-seven cents per inch.

Illustrating the wonderful power and execution of water employed against the deep gravel deposits through the hydraulic monitors, it is only necessary to refer to what was actually accomplished in the Miocene mine, near Oroville. In a period of forty days, the monitors in this mine projecting streams aggregating 3,000 miner's inches, removed 300,000 cubic yards of earth, which yielded one thousand dollars per day, or thirteen and one-third cents per cubic yard. The quantity of gravel washed off in a season in a hydraulic mine is measured by acres, and by so many millions of cubic yards. State Engineer William Hammond Hall estimates that, on streams draining into the Sacramento basin, 15,122,000 twenty-four-hours miner's inches of water is used in hydraulic mining, and that 53,404,000 cubic yards of material is washed off by it into the cañons, 22,326,500 cubic yards being dumped into the Yuba and its tributaries—namely, the streams draining "The Ridge." Thus, the degradation of the placer-formations of the mountains, which would take nature ages to accomplish by ordinary agents, is being consummated with great rapidity by the hydraulic miner in his pursuit for the precious metal.

The number of men employed in a hydraulic mine using, say, one thousand miner's inches of water, is from twenty-five to thirty. Chinese laborers are employed in the least important work, in drudgery which it would be difficult to get competent white labor to perform. It is estimated that at least twenty thousand men are employed in hydraulic mining. The last census shows a population of 127,858 in the counties where mining is the chief industry. Some of the most beautiful and most flourishing mining towns are situated in the hydraulic mining districts. Nevada, San Juan, and Smartsville are towns

of considerable population, and rely mostly, or exclusively, for their existence, on hydraulic mining. Of course, most of the buildings in these mining towns are not of a permanent character. In some of them mining operations have compelled a removal of an entire town to a new site. But the hydraulic miner, nevertheless, makes his habitation as comfortable and beautiful as his time and his means will permit. It is no uncommon thing to find the miner's cottage embowered in roses and surrounded by a productive orchard bearing choice fruits.

Most of the hydraulic mines are owned by persons resident in the State. The gold product of California, from the discovery of the precious metal by James W. Marshall, in the tail-race of Sutter's Mill, January 19, 1848, to June 30, 1881, amounted to \$1,170,000,000. Of this sum \$900,000,000 is estimated to have been extracted from the auriferous placers. The remainder represents the yield of gold-quartz mines, of which the State contains many. The yearly product of gold in California is from \$15,000,000 to \$20,000,000. From the date of discovery to 1861 inclusive, the gold product of California aggregated \$700,000,000, derived chiefly from the modern river-beds and shallow placers. A large proportion of the remaining \$200,000,000 has been obtained in the deep gravel deposits, by the hydraulic method. Strange as it may appear, an industry which has contributed so largely to the wealth of the world, and has been the means of the settlement and development of California, has reached a period in its history when it is claimed by a large portion of the community to be a greater evil than blessing, and the question of suppressing the hydraulic method of gold-mining has been the subject of earnest discussion in and out of the halls of legislation. The law has been invoked to suppress or control it. Even the State, through its Attorney-General, has commenced a suit to suppress it. The trouble grows out of the immense amount of débris which the hydraulic miners are discharging constantly into the water-courses of the State. That trouble would finally arise from the great volume of hydraulic mining débris has been apparent for years. The hydraulic miners themselves early saw the impending trouble. Several years ago, when a suit was commenced by a Bear River farmer, named Keyes, against a hydraulic mining company, they prepared to defend their vested rights by organizing what is known as the Hydraulic Miners' Association. Every company in and out of the association fortified its position by securing all needful water-privileges under the State laws, and

a United States patent to the land. The diversion of water from its natural courses was included in these privileges. In most cases patents have been issued to these hydraulic mining companies, the miners paying the Government for hydraulic deposits double

resort was had to the courts. It is a somewhat singular fact, in this bitter controversy between miners and farmers, that circumstances should have compelled Marysville to side against the very industry which created it.

A survey of the Sacramento Valley, made

A MINER'S HOME.

the price of agricultural land. So long as the agricultural products of the State did not exceed home needs, and the damage caused by the down-pouring of mining débris was confined to the filling up of the foot-hill cañon and the destruction of an occasional orchard or small farm adjacent to the mining districts, it received only a passing notice. It was not until the great tributaries of the Upper Sacramento River began to fill with débris so that their beds were unable, during the flood season, to carry the waters which poured down from the Sierra, that the valley men became alarmed. About the same time complaints of the shoaling of the navigable waters of the Sacramento River became common. It led to a unanimous cry from the men of the valley against the men of the mountains. The inundation of the Sacramento Valley, in the spring of 1878, brought matters to a crisis. A Farmers' Association was organized for the purpose of self-protection against the hydraulic miners and as a counter institution to the Hydraulic Miners' Association. The city of Marysville, situated at the confluence of the Feather and Yuba rivers (and which, notwithstanding a costly system of levees, was threatened with inundations, owing to the filling of the beds of the stream) also rose against the miners, and

by the State Engineer in 1878-79, showed that there are 1,742 square miles in it subject to overflow. This territory comprises some of the best wheat-land in the State. A large portion of the million tons and upward of wheat which the State exports each year is grown within this region. Some of the most important towns and cities in the interior of the State are located within the inundatable district, among them Sacramento, the capital. Levees are required to protect these towns from the rising waters, and levees have also been built on a costly and extensive scale, to protect the inundatable land which is under cultivation. But, on various occasions, the floods have overtopped them.

There is some difference of opinion concerning the area of land damaged or buried, and the value of the property destroyed. A committee on "medical topography, meteorology, endemics and epidemics" of the State Medical Society of California, has made the subject a matter of special study and investigation. The chairman of that committee, Dr. M. M. Chipman, of San Francisco, visited the district invaded by the miners' "slickens," and in his report to the society he says: "slickens" has destroyed "40,050 acres of the richest and most valuable fruit and garden land in the State \* \* \* and 270,991 acres

of other valuable lands have sustained great damage and depreciation of value." He estimates the value of the aggregate loss at \$15,944,739. The State Engineer, on the other hand, has placed the damage from mining débris much below Dr. Chipman's figures. He estimates the total area damaged at 43,546 acres, and the total depreciation in value at \$2,597,635.

Great floods are among the periodical natural phenomena of California rivers. The filling-up of the beds of the streams with débris increases their tendency to overflow. The denudation of forest-land in the mountains has also increased the rapidity of their drainage. The sources of this débris are numerous. Agriculture, the construction of roads, the cutting of timber, the disturbance of the surface-soil by live stock, and the degradation by the elements of the volcanic conglomerate which figures largely in the geological formation at the head-waters of some of the principal northern streams, form some of the sources of this débris. But the chief source is mining, and more particularly hydraulic mining. Quartz and drift mining are not unimportant elements in it. At least ten thousand tons of pulverized matter finds its way each day into the beds of the streams from this source. It is the lighter soils of the hydraulic mines and the pulverized matter from the quartz-mills of the mining region which constitute "slickens."

The specific gravity of slickens, as determined by M. Hanks, is  $2\frac{1}{2}$ . After the floods subside, the slimy sediment which has been deposited drains off and hardens, resolving itself into a creamy-colored substance, yielding no vegetation, where lying in large quantities, except willows; a flake of dry slickens looks very much like brick-dust, such as is used by every housewife for burnishing cutlery, etc. The bottom-lands of the Feather, Yuba, Bear, and American rivers have received an enormous deposit of slickens and coarser débris, which is in many places several feet in thickness. A scene of desolation is thus presented to the eye. Slickens has invaded every nook and corner. It blinds one to look at it. It fills the air and stifles the nostrils in moving through it. It has converted clear and high-banked streams of former days into sluggish, turbid, and erratic water-courses, flowing on elevated beds between artificial banks. Land formerly luxuriant with growing crops is barren as Sahara. The first remedy suggested was the enlargement of the drainage capacity of the Sacramento River, by the construction of a canal from a point north of Sacramento to the head of Suisun Bay. It was expected that the city

of Sacramento and the river islands would be saved from inundation by this means. As a matter of fact, the river islands have been under water since 1879, despite an improved system of levees. The canal project was abandoned partly on account of the estimated expense, but more particularly because its failure was almost certain, as the scouring action of the river would be reduced in proportion to the volume of its water diverted into the canal. The next proposition was to impound the débris in the river-cañons, and thus prevent its flow into the valley. Some of the ablest engineers in the country have declared the feasibility of such an undertaking. The plan contemplates the construction of dams of rip-rap at suitable localities (of which there are plenty in the cañons), which shall arrest the downward progress of the heavy débris. For the impounding or storage of débris in the cañons of the Yuba and its tributaries, it was estimated that dams of a capacity of 530,000,000 cubic yards could be constructed at a cost of \$2,453,779. These storage-dams, it is argued by the State Engineer, in a report which he made to the Legislature, would retain the heavier débris of thirty-two years' hydraulic mining on the same ratio as he represents it is now being carried on,—namely, the removal of 22,326,500 cubic yards of gravel per annum,—which would represent the removal of a grand total of 755,000,000 cubic yards. To provide similar impounding dams for the Feather, Bear, and American rivers, State Engineer Hall estimated that the total expense would amount to \$7,000,000. Whether these figures are delusive or not, they had the charming feature about them of leading a great many people to believe that agricultural land worth many times the total cost of these dams might be saved through their construction, and that hydraulic mining, which yields annually double the amount, need not be stopped. But the Legislature hesitated to authorize the undertaking. At this juncture, Captain Eads, of Mississippi jetty fame, was called in as a consulting engineer, and it was afterward determined to construct a brush dam at the mouth of the Yuba, and another of the same material at the mouth of Bear River. These dams were built on the same plan as the jetties built by Captain Eads, to deepen the South Pass of the Mississippi. The Yuba dam was 8,700 feet in length. The Bear dam was somewhat shorter. Half a million dollars of the State's money was spent in the construction of them, and with the first rising of the waters seventeen hundred feet of the Yuba dam was undermined and washed out. Wide gaps were also broken in the Bear River dam.

What the flood spared of Yuba River dam was destroyed by fire during the following summer. A great plain of slickens lies above each of these brush dams, ready for coming floods to sweep into the doomed valleys and towns below.

The failure of the brush dams to fulfill their intended mission was followed by a decision declaring against the constitutionality of the tax levied to build and maintain them. This was the signal for a renewal of hostilities. The mines were enjoined, and for many weeks many of them remained closed. The hydraulic mining companies estimate their losses through these distressing legal restraints at over \$1,000,000.

It is impossible to tell what will be the outcome of the controversy which has grown out of the peculiarities of the drainage of the Great Valley of California and the disposition of the débris of gold-mining. It involves the right of one person so to manage his property as to damage and destroy that of his neighbor. It involves the right of one or more of the industrial classes to say that an industry which was originated under and has been fostered by the laws of the State and the nation, shall no longer exist. It involves the right of the State to interfere with the operations of an individual or corporation in the prosecution of a calling lawfully carried on under rights and privileges derived from the Federal Government, as well as from the Commonwealth of California, and holding the letters-patent of the United States to the land to do with it just that which is being done; in other words, "States' rights under a new form." It

also involves the maintenance of the navigable waters of the State; the support of a large and industrious population in the valleys and in the mountains; questions of drainage, of influence on climate through the denudation of the forest land of the Sierra for mining and other purposes; and it may involve the question of public health, so far as it relates to the valley towns and settlements. It may likewise involve the construction of great and costly works by the nation to impound the moving débris, and to keep open the bays and streams to navigation. The question thus assumes a national aspect. It is brought home to the nation when California's representatives introduce bills in the National Congress to meet the exigencies of the case. In the meantime, some of the hydraulic mining companies in Sierra County have made the best of the situation by building dams across the cañons into which their débris is discharged, to impound it. It is making a virtue of necessity; but it may also be construed as an acknowledgment of the principle that the mines must take care of their own "tailings."

It is not reasonable to presume that hydraulic mining will cease. The great gravel deposits will furnish at least a half-century's vitality to the industry, and they contain, it is estimated from what has been worked already, not less than \$6,000,000,000 in gold. It is not likely that an industry which gives a large percentage of the gold product of the world will be suppressed because engineering skill has not yet devised or put in operation means to neutralize or overcome the evils it creates.

## EPHEMERA.

MIDGES and moths—ay, all you restless things  
That dance and tourney in the fields of air,  
You—Psyche's postman, trim and debonair,  
With eye-like freckles on your bronzed wings;  
You—candle-elves, whose strange emblazonings  
With sign of death our ancient gossips scare;  
Or, who, when sleeps the humming-bird, repair,  
With stealthy beaks to drain the honey springs:—

Your secret's out! I know you for the souls  
Of all light loves that ever caused heartache,  
Still dancing suit, as some new beauty toles!  
Nor can you e'er your flitting ways forsake,  
Till the just winds strip off your painted stoles,  
And sere leaves follow in your downward wake.

*Edith M. Thomas.*

## THE CHRISTIAN LEAGUE OF CONNECTICUT.

BY WASHINGTON GLADDEN.

### IX.

IN pushing its campaign for the suppression of drunkenness and pauperism in New Albion, the club soon found the need of a work more radical than any it had yet attempted. The streets of the town were thronged every evening with young men from the mills, whose homes were cheap boarding-houses, and to whom the saloons offered about the only place of resort. To prevent or punish the sale of strong drink to such of them as were under age was well, so far as it went; but the call for more efficient measures for restraining and saving those young men and boys began to make itself heard.

"What we want," said Mr. Biddle, one of the delegates from the First Church, "is a Young Men's Christian Association."

"Have you never had one in New Albion," inquired Mr. Thorpe.

"Oh, yes," answered Mr. Biddle, "we had a flourishing association here for several years—rooms in Stone's Block; had a secretary who gave his whole time to the work; held several conventions here; sent delegates to all the international conventions; went myself once as delegate."

"What became of it?"

"Oh, it died about five years ago!"

"What ailed it?"

"Well, I don't know. People seemed to lose interest in it; workers dropped off; took the secretary pretty much all the time to raise money to pay his own salary and the rent; the thing fell through."

"But if it was occupying its field and doing its work, I should have thought that the people of New Albion would have refused to let it die."

"That was exactly the trouble," answered Dr. Sampson. "If the association had confined itself to work for the benefit of the young men of the town—providing them a safe place of resort and pleasant companionship and wholesome diversion and good religious influences, it would have justified and prolonged its life. But, led by certain zealous brethren, it undertook to do a great many other things. It began to hold gospel meetings at the jail and the poor-house, and outdoor meetings in the park and in the groves

on Sunday; it undertook to establish mission-schools here and there; it began a series of evangelistic meetings in every town in the county; it seemed ambitious to take into its hands the entire management of religious affairs in all this region. Instead of being a society whose object was to work for young men, it became a society whose chief object was to afford a few zealous young men, and a larger number who were no longer young, an opportunity to exercise their gifts of speech in various places for the general benefit of the human race. It spread itself so thin that it finally soaked in and disappeared.

"But could we not have a new organization, and avoid the old mistakes?" asked Mr. Biddle.

"Possibly," replied the doctor. "Yet it seems to me that the distinctively religious work in behalf of our young men can be done as well by the churches, and that the thing we most want is some sort of a place in which young men may safely spend their evenings together."

"That is what you want," said Mr. Franklin; "and about half the young fellows you want to get in will be kept away from such a place if it purports to be a religious resort. In vain is the net of a Christian Association spread in the sight of most of these birds. But if you would open, say, a 'Young Men's Union Club,' they would come into that; that wouldn't be a scarecrow."

It is not necessary to detail the conversations that followed. There was considerable difference of opinion about methods; but after two or three conferences, a plan was matured by which a building, devoted to the young men of New Albion, was erected on the main street of the town. It was built by private subscription, and was held and managed by a self-perpetuating board of trustees. On the front of the building, cut into the stone, was the simple legend, "Young Men's Club." The first floor was occupied by a coffee-room, a smoking-room, a chess-room, and a reading-room. The second story front room was a library and correspondence room, and the large room in the rear was a gymnasium, which, with a supply of camp-chairs, could be speedily converted into a lecture hall.

The club was not free, save that the coffee-room, opening on the street, was for the use

of the public. Refreshments were furnished at low prices—a good cup of coffee with a sandwich for five cents. For the privileges of the other rooms, and for all the advantages of the club, members paid fifty cents a quarter. For the gymnasium there was a small extra charge. It was found that the young men prized the club the more because it was not free, not wishing to be mendicants in their pleasures. A large number of the young men of the churches joined the club, and took part in its various literary enterprises and diversions. Before the end of its first year it had a membership of several hundred, and had begun to prove a formidable rival to the liquor shop and the minstrel show.

To another of the enterprises set on foot by the Christian League only a passing word can be given. That was the establishment in one of the poor districts of a free kindergarten. Dr. Strickland had visited some of these schools in Boston, and had come back full of enthusiasm for this method of charity. "It is a great discovery," he said. "No other work promises such results in the salvation of the poor. If you can get the little children out of the squalid homes into a clean and bright place, and keep them there four or five hours a day, under the care of patient, cheerful, loving women, who never beat nor scold them,—who teach them the first principles of courtesy and kindness and self-control and keep them happy, with pictures and games and marches and songs,—if you can keep them under such influences until they are six or seven years old, impressions are likely to be made upon their characters that will never be erased. The memory of these happy years will be a daily blessing to them. Besides, through the children, you get such access to their parents as you could secure in no other way; and the children themselves carry the gospel of neatness and gentleness into their homes—the best missionaries you can find. One kindergarten is worth more in the way of civilizing and Christianizing these Arabs in embryo than six mission Sunday-schools. One hour a week doesn't amount to much; four hours a day really tells on a child's life."

Dr. Strickland was so thoroughly in earnest, and he brought so much testimony to support his project, that funds enough were easily raised to set the kindergarten a-going. Once at work it so completely proved its beneficence and justified Dr. Strickland's faith in it, that the churches all rejoiced to bear a share in its support; as its numbers grew its quarters were enlarged, and more teachers were employed; now, at the end of three years, every citizen is ready to testify to a

great improvement in the manners and the morals of that depraved district in the midst of which the kindergarten stands.

# x.

It must not be supposed that the Christian League Club had lived and wrought all these years in New Albion and been heard of by nobody. Its members took no pains to advertise its doings, neither did they have any secrets; many things had come to pass of late in this thriving town; a new spirit of coöperation and of enterprise had taken possession of the churches; their power was more perfectly concentrated and more effectively expended than ever before, and the results were beyond question or cavil. The source from which these good works proceeded could not be hid. At first there was a disposition on the part of some of the uninvited to speak skeptically about "secret conclaves" and "close corporations," but as it became evident that nothing nefarious was hatched in these conferences, that the club assumed no power, and only served as an apparatus for generating and directing public opinion, and that its conclusions had no more force than there might be in the reasons by which they were supported, the ungraciousness of finding fault was recognized by most sensible persons, and the club became a highly popular organization. A little conversation which occurred one day between Captain Conover, a Baptist, and Dr. Duncan, a Methodist, in the office of the latter, fairly illustrates the public sentiment:

"The fact is," said the captain, "that we haven't got but one church here in New Albion. There are several different meetin'-houses, and several different congregations, and they have various ways of workin' and worshipin', but there aint but one church. We all stan' together pretty solid, I tell 'em. We all move as one body. There aint any pushin' of Baptist interests or Meth'dist interests or Congregational interests or 'Piscopal interests; the only thing we're pushin' is the kingdom of heaven. I tell you what it is, it's ben a-comin' faster these three last years 'n I ever see it come before."

As the captain's heart warmed, his dialect strengthened.

"You are right," responded the doctor. "We've got things on a very good basis. I was afraid that when Brother Thorpe went away we might get a minister who wouldn't work in so well with the rest; but Brother Hartwell seems to have been fairly captured by the League, and he will do his part, you may depend. As for the Methodist laymen

of New Albion, you can always count on them. They have some solid reasons for thinking well of this club. It will take them a good while to forget that Sunday afternoon when the little chaps walked up the aisle of our church, one after another, with the letters that proclaimed to us deliverance from our bondage of debt. I don't think so much of shouting as some of our folks do, but I shouted then, as loud as the loudest of them."

"Well," said the captain, "this new way is a pretty old way after all, I guess. It's about the way they did it in Ephesus and Antioch, when the disciples was called Christians,—not Baptists nor Meth'dists. There was only one church there, 'n yit like enough there was half a dozen congregations. P'raps they didn't all have jest the same rules, nor jest the same ways of worshipin', but they all worked together. This is the kind of Christian union that plain and sensible folks believe in. Some of the brothering that run the machines don't think much on't; but the rank 'n file are sound. We've been a-prayin' for years that all Christ's disciples might be one, and makin' no end of talk about it, but it was mostly talk; now we've got down to business."

Captain Conover was a sort of village oracle, and his shrewd comments reflected the prevailing opinion.

Not only within the precincts of New Albion, but beyond its borders, the unity of its churches became a theme of conversation. In three or four of the larger towns in the neighborhood similar clubs had been formed, and the experiences of New Albion were repeated with some variations. The notion that the relations of Christian churches ought to be those of coöperation rather than of competition, began to get a firm lodgment here and there in Bradford County. The small country towns, back among the hills, away from the railroads, were the places into which it was hardest for the new gospel to find entrance. In many of these towns, with populations of less than a thousand persons, there were from three to five churches,—sometimes two of the same sect. The members of these churches generally regarded the peculiarities of their several sects as matters of supreme importance, and repelled with heat any suggestion of closer relations between the churches. The narrowness of the laity in these towns was not likely to be mitigated by their religious teachers,—the feebleness of the churches making it difficult for them to secure pastors of intelligence and breadth,—though this rule was not without shining exceptions.

One Monday forenoon, in November, Mr. Strong with Mr. Hartwell, the new Methodist minister, a man of fine scholarship and

excellent spirit, had dropped in at Dr. Sampson's study, and were holding a rather jovial conference with him, when a weather-beaten covered buggy stopped opposite the house, and a venerable man, with a clean-shaven face, and a fringe of gray beard under his chin, passed by the window of the study and rang the bell.

"That's Father Crane of Monroeville," said the Doctor, going to the door; "come in, Father Crane; come right into the study; I want you to know my friends;" and the Rev. Jonas Crane, pastor of the Baptist Church in Monroeville, was formally presented to the other two clergymen and cordially received by them."

"You must have got an early start," said Mr. Strong, "to have driven eighteen miles this morning."

"Somewhat early," said Father Crane slowly, and precisely. "The denizens of the rural communities find it necessary to use the prime of the morning, and I awake no earlier than is the wont of my parishioners."

"Morning comes a little earlier to the folks on the top of Monroeville hill than it comes to us dwellers in the valley," said Dr. Sampson.

"New ideas strike you up there a little earlier than they do us, I suppose," said Dr. Hartwell, smiling.

Father Crane's face darkened.

"I trust not," he said. "We are not much given to novelties. The old gospel is commensurate to all our exigencies."

At this moment the servant appeared at the study door, announcing that a caller was inquiring for Mr. Strong. The latter, begging to be excused, went out into the hall and soon returned, bringing the caller with him.

"Oh, no; ceremonies are off," he was saying. "Come right in! Dr. Sampson, this is the Reverend Mr. Slade, of the Congregational Church in Monroeville; Mr. Hartwell, of the Methodist Church; you know your neighbor, doubtless." The greeting of Father Crane and Mr. Slade was not unfriendly, but somewhat constrained.

This irruption had not subsided when Mr. Hartwell was called out in the same way, and returned, rejoicing, bringing his man with him.

"You can't outvote me any longer," he said; "the Methodist reënforcements have arrived," and he introduced the Reverend Mr. Towne, of the Methodist Church in Monroeville; whereupon there was hilarity, into which the three ministers from New Albion seemed to enter with rather more spirit than the three ministers from Monroeville.

"Well!" said Mr. Strong, putting that syllable into a heavy expiratory blast, "Mon-

roeville has come down upon us this morning like the wolf on the fold."

"And for the very same reason that the wolf came down, I suspect," said Mr. Slade.

"Hunger, eh?" suggested Mr. Strong. "Getting starved out, are you?"

"My brethren can speak for themselves," said Mr. Slade; "but that's about my case."

"So I inferred from your last letter. And I have a shrewd suspicion that all you Monroeville pastors are here upon the same errand."

"Father Crane had written to me," said Dr. Sampson, "that he wished to consult me with reference to a grant from our Home Evangelization fund."

"Under these circumstances," said Mr. Towne, "I need not blush to confess that I have come down hoping to obtain a few subscriptions from Mr. Hartwell's people toward making up the deficiency in our accounts."

"This is a remarkable coincidence," said Dr. Sampson. "I am inclined to call it providential. And now we are here, altogether, it is a good time to have a frank talk about the work in Monroeville."

"How large a town is Monroeville?" asked Mr. Hartwell.

"About a thousand inhabitants," answered his Methodist brother.

"Eight hundred and twenty-three in 1870," said Dr. Sampson, referring to a gazetteer. "The population is not increasing, I presume?"

"No, it is falling off," answered Mr. Slade.

"Any other churches besides your three?"

"No; the Episcopalians have a small interest and the Adventists also; but neither society has a meeting-house, and neither has a pastor. They hold occasional services in a hall."

"Five religious societies, a population of eight hundred and twenty-three: exactly one hundred and sixty-four souls and three-fourths of a soul for each society."

This was Mr. Strong's arithmetic.

"But when we remember," said Dr. Sampson, "that not more than three-fifths of the population of any town *can* attend church on any Sunday, we reduce the number of possible church-goers to less than one hundred for each congregation."

"I suppose," said Mr. Hartwell, "that there are many families in your town that are not connected with any of your churches."

"Of course," answered Mr. Slade.

"How large a proportion of your people, do you think, are outside all these societies?"

"Counting in the Roman Catholics, of whom there is now a sprinkling, I should say one-third."

Further questioning brought out the fact that the aggregate membership of the three Mon-

roeville churches represented on this occasion was ninety-eight, and the total number of persons present on a fair Sunday morning about one hundred and thirty. It was also testified that the salary of the Congregational pastor was six hundred dollars, two hundred and fifty of which was contributed by the home missionary organization of the county; that the Baptist parson's salary was five hundred dollars, of which one hundred and fifty came from a similar source, and that the Methodist minister subsisted on four hundred and fifty dollars, a portion of which he collected every year by visiting well-to-do Methodists in neighboring towns.

"Now, let us figure a little," Mr. Strong proposed. "The population of Monroeville is not more than eight hundred and twenty-three; the population of New Albion is not less than thirteen thousand; Monroeville has five religious societies, and makes no provision for its Roman Catholics; New Albion has ten, including the Roman Catholic Church. If we had as many churches in proportion to our population as you have, how many churches would there be in New Albion? As eight hundred and twenty-three is to thirteen thousand, so is five to the answer. Cipher it out, Brother Towne. What do you make it?"

"Seventy-eight."

"Yes; that is the number of churches we should have in New Albion, if we were as liberal in our allowance to ourselves of religious privileges as the people of Monroeville are to themselves."

"You don't mean that," protested Mr. Slade.

"Oh, you needn't lay it to me," answered the other. "I haven't invented these facts. I'm not responsible for them. The question is not what I mean, but what the good people of Monroeville mean."

"Your comparisons are odious," laughed Mr. Slade. "But they are not quite fair. We have really but three churches in Monroeville."

"Count out your Episcopalians and your Adventists, then," persisted Mr. Strong. "I doubt whether it is fair to do it, for it is a question whether their congregations are not nearly as large as some of yours; but leave them out of the account and recast the proportion, and it will give us forty-seven churches, as our lawful share in New Albion, provided your standard is a good one. Are your people any richer than ours?"

"I doubt it."

"Is the valuation of your town, *per capita*, greater than ours?"

"I couldn't say, but I should guess not."

"No use in guessing," said Dr. Sampson;

"here are the figures in our State reports, and it is a simple sum in division. The valuation of Monroeville, *per capita*, is exactly four hundred and one dollars, and of New Albion six hundred and seven."

"We are much better able, then," Mr. Strong went on, "to have fifty churches than you are to have three, and what would be said of us if we undertook to maintain fifty separate church organizations in this town? Our ten churches amply provide for all the wants of this community."

"You are bearing down heavily upon us, Brother Strong," said Mr. Towne. "But there are some features of the situation that you do not take into the account. You must remember that these churches on the hills have long been the nurseries in which many of the members of your city churches have been trained. Our young men grow up under the influences of these small churches, and as soon as they are grown they depart to the cities and the large towns. The training they receive while they are with us fits them to be useful men wherever they may go. You will find that the bone and sinew of your own church was reared on these hills."

"I am quite familiar with that fact," replied Mr. Strong, "and I do not wish to leave it out of the account. That churches ought to be supported in the small country towns needs no argument: the only question is whether you need five times as many churches, in proportion to the population, as we find necessary in the larger towns."

"But our population is scattered over a large territory."

"How far apart are those two of your churches that are farthest apart?"

"About a mile."

"Do the people pay much attention to the question of distance in selecting their churches?"

"I cannot say that they do."

"Do those, for example, who live nearer the Methodist Church than any other, all or nearly all attend the Methodist Church?"

"Oh, no."

"Practically, then, so far as distance is concerned, the people of the town, take them all together, would be as well served by one church, located at some central point, as they are now."

"Nearly so; yes."

While this conversation had been going on, Father Crane had been nervously stroking his bald head. Like the dove he had found no rest for the sole of his foot, though he had sought it for both of them by many nervous shifts of his left leg over his right and vice versa. At length he ventured to say:

"Brother Strong seems strangely oblivious of the circumstance that Christian people, in the rural communities as well as the urban, have convictions of their own respecting the doctrines and ordinances of religion which they consider themselves under obligation to maintain. We have, in Monroeville, those who are Baptists because of unfeigned and unalterable persuasion; and Congregationalists, I presume, of whom a similar state of mind might be predicated; and Methodists, who also devotedly desiderate their own peculiar forms and ceremonies. Why have we not an equal right with the dwellers in more populous places to indulge our predilections?" Father Crane's rather pompous sentences were full of the warmth of sincerity.

"Our venerable brother goes for the root of the matter the first time," said Mr. Strong, instinctively opposing his homespun idioms to the country-parson's Johnsonese. "The reason why there are three churches in Monroeville instead of one, is that everybody thinks he must have his pet notions gratified in the fashion of church life and work. These fashions, like many other fashions, may well enough be followed if folks can afford it. Here's my neighbor, with wages enough to live in comfort, if they are wisely expended. But he thinks that his wife must have just so many ribbons on her bonnet and so many laces on her cloak, and that his girls must have just such a style of shoes; and so much money goes for all these fine fixings that he has to come around once or twice a year and ask his neighbors for flour and coal."

"But," protested the old gentleman, "you do not intend to insinuate that there is any similitude between the vain adornments you have mentioned and the distinctive principles of a religious denomination?"

"That is exactly what I mean. Ribbons and laces are not necessarily vain adornments. They are beautiful, and may be indulged in with thanksgiving, if one does not sacrifice in getting them that which is of more consequence. In like manner the various denominational peculiarities are innocent enough; but they add nothing to the real value of the gospel of Christ, any more than the laces add warmth to the cloak. Believing in these denominational peculiarities does no man any good whatever. It nourishes no man's manhood; it saves no man's soul. The only effect of exalting these things is to belittle the manhood and to shrivel the soul. Yet it is by exalting these small distinctions that the Christians of Monroeville maintain three churches when there is barely room for one."

"You fail to see some of the aspects of this case," said Mr. Slade. "I have always

thought it better for every family to have a home by itself, even though it may cost a little more than it would to put three or four families together in the same house. I would rather have my own fire and my own table and my own family altar. Such an arrangement is in the interest of peace and happiness."

"I thank you for that illustration," answered Mr. Strong, "because it is familiar, and because I wish to show that it wholly misses the point. The Christians in Monroeville do not belong to three families. They are all members of one family. The case is like this: An old mother and two daughters have income enough to live together in comfort. But there are some small matters about which they disagree. They like the same kind of bread, but one wants the loaves round, and another prefers them square, and a third insists on twists. They all wish to burn coal, but one desires a grate, and one a base-burner, and one a sheet-iron stove. Their differences are all of this nature. They love one another dearly—so they say; they often get together and tell one another how much they have in common, and yet they insist on living apart. The rent of three houses must be paid, three fires must be fed, three lamps must burn; the expense of living for the three is more than twice as much as it would be if they all lived together. Their income will not support them. So every year they go around among the neighbors and take up a collection to enable them to keep up these three separate establishments. Is it any wonder that the wisdom of this management does not always appear to the persons who are asked to subscribe?"

"You disapprove of denominations, then?" queried Elder Crane.

"Let us stick to Monroeville for the present," Mr. Strong proposed. "The real question now is whether there ought to be three churches in Monroeville."

"Of course," said Mr. Slade, "if you come to that, there ought not to be more than one,—but —"

"Well, go on; complete your statement."

"The real difficulty is to know which two of these churches ought to commit suicide for the benefit of the third. Wendell Phillips tells a story of the discontented wife who said, 'They tell us that in the eyes of the law the man and his wife are one, but I've found out that the man's the one.' I suppose that the Congregationalists of Monroeville are all agreed that there ought to be but one church in that town, and that the Congregational church is the one; and that the Baptists have the same opinion about their church, and the Methodists ditto. For my part, I own

that I am inclined to stand with my own people. Ours is the old church. Your parable of the mother and daughters fits in here. The girls ought to have staid in the homestead."

"I don't know about that. There was a real justification, fifty or a hundred years ago, for the formation of new societies here in New England. The protest of the Baptists against the State church, and of the Methodists against the hyper-Calvinism and the frigidity of the standing order were right and reasonable. They did a good service in coming out from the old church and lifting up their standards. In view of that service they are entitled, I think, to just as much consideration as the Congregationalists, in the settlement of this problem of consolidation. But the real reasons for separation no longer exist. The things against which they protested have disappeared. Your Calvinism, Slade, would never trouble the stoutest Arminian; and the same thing is true of nine-tenths of the Congregational ministers. The old frigidity is gone from our worship; we sing and talk and pray in our social meetings as freely, if not quite so fervidly, as our Methodist brethren; women are finding their voices; the old lines that separated the two sects are substantially obliterated; the old difference between us and the Baptists with reference to state support no longer exists; and our ministers now generally immerse all who desire it. There is a deeper difficulty with respect to communion not yet overcome, but I have strong hopes that even this will not be suffered to stand in the way of consolidation in the small towns."

"So far as I am concerned," said Dr. Sampson, "I am not prepared to abandon the Baptist ground on this subject: but in view of the mischiefs arising from division in small communities, I am ready to go to the verge of my principles in promoting unity."

"Is it not true, brethren," Mr. Strong went on, "that the real differences of doctrine and of worship among the Christians of Monroeville are wholly insufficient to warrant the existence of three separate churches?"

Mr. Towne and Mr. Slade at once confessed, and denied not. Elder Crane was less acquiescent.

"I am now an old man," he said, "and I do not readily accommodate myself to new measures. I acknowledge the justice of much that Mr. Strong has urged,—especially the historical references that he has adduced; but I could not consent to have my little church on the hill abandoned. There are too many precious memories." The old clergyman paused, and there were tears in his voice as well as in his eyes. In a moment he went

on: "My time is nearly come, however. One part of my errand to-day was to consult about laying down the burden that has become too heavy for me. And I shall not stand in the way of any plans of reorganization which my people may wish to adopt."

"I understand and respect the feeling of Elder Crane," said Mr. Strong. "The old associations are sacred. It is hard to give up the old home. But when it costs for repairs more than we can possibly raise, and we are in danger of being buried in its ruins, judgment must prevail over sentiment."

"But here's the rub," said Mr. Towne. "How are you going to make the people of Monroeville see this thing as you do?"

"With your help," answered Mr. Strong, "the thing can be done. Will you not confer together, and then call on us for any help we can render? We have learned, you know, here in New Albion, how to dwell together in unity, and we would be glad to show our neighbors how they may go and do likewise."

The two younger ministers of Monroeville promised to look it over, and to see what could be done, and thus the conference ended.

#### XI.

THE report of the conversation in Dr. Sampson's study furnished a theme for the next meeting of the club.

"Since our talk that morning," said Dr. Sampson, "I have taken pains to get at a few of the facts about the small towns in this county. Monroeville is the type of a class. There is Stapleton, with a population of eleven hundred, and with four churches; Scantico, with six hundred people and three churches; Rowell with nine hundred people and four churches, and so on. Eight towns in this county, with an aggregate population of nine thousand one hundred and thirty-four, support thirty-seven religious societies. Of these at least fifteen are receiving more or less aid from the various home missionary organizations."

"Even when the societies are self-supporting," said Dr. Phelps, "the support is generally meager, the membership is small, and the terms of the pastorates are lamentably short."

"It is plain," said Mr. Hartwell, "that the churches in these small towns ought to unite. What hinders them?"

"First," answered the doctor, "is the strength of the sectarian prejudice,—always more intense in the small places than in the large ones. Then there is a sentiment much less reprehensible,—the attachment to the local organization, around which many grateful memories cling. The people do not like

to give up a church which may have a noble history, and which is sure to be the shrine of sweet associations."

"Certainly," said Mr. Hartwell; "those hindrances are obvious. They may be called sentimental; even so they are not easily overcome. Are there any other practical obstacles?"

"In most of these towns," said Mr. Peters, "the only way of uniting would be to abandon the old organizations and form a new one,—a union church, like ours at Cyprusville."

"But, do you know," Mr. Franklin broke in, "that it is legally impossible to do anything of the sort?"

"What do you mean?" demanded three or four voices.

"Just what I say. The union of two churches of different denominations is a proceeding so rare that no provision for it is made, so far as I can learn, in our statutes, nor in those of any other State. Secular corporations can be legally consolidated, but church corporations cannot be. Christian union seems to be regarded by our legislators as against public policy. Churches have sometimes been brought together, but the act was unwarranted by law. Any troublesome member of either church could have procured an order from the courts tearing them apart again."

"Then," said Mr. Strong, "it is high time that we had an act before the Legislature, enabling churches to obey the Christian law. I hope that unanimous consent will be given to the appointment, by this club, of Mr. Franklin as our agent, to secure the passage of such a law at this session."

Consent was readily given. Concerning the work of Mr. Franklin in the lobby of the Connecticut Legislature the historian of the club is not fully informed; but the facts to be recorded below indicate that he must have been successful.

"There is another practical difficulty," said Mr. Franklin, picking up the thread of the discussion where Mr. Peters had dropped it, "more serious than the legal disability. When you have got your union churches formed, they belong nowhere. Now, people like to feel that they do belong somewhere. If they are weak and small themselves, they enjoy the knowledge that they are members of some respectable body in whose interests they have a part. These union churches have nowhere to go, unless we invite them into our Congregational conferences, as we generally do. But then the other sectarians say that a union church is nothing but a Congregational church. There is truth

enough in what they say to make it necessary to devise some means by which these union churches may find a less ambiguous fellowship; and I propose a convention of all the churches in the county to meet twice a year for consultation about Christian work in the county."

"Who should call such a convention?" asked Mr. Hartwell.

"This club," answered Mr. Franklin. "A committee, consisting of the minister and one layman from each of our churches, should issue the call, summoning every church in the county to send its pastor and a lay delegate to such a convention, at which a permanent organization should be effected."

"What churches should we invite?"

"I would put the Apostles' Creed into the call, and send it to every church in the county—Protestant or Roman Catholic—with a sentence explaining that any church which accepts this creed and conforms to it in its teaching would be welcome in the convention."

"Do you suppose that the Romanists would come?" queried Dr. Strickland.

"I fear they would not; but I would invite them."

"Would you dare to open the doors to heretics?" asked Mr. Peters.

"Any church that makes its teachings conform to the Apostles' Creed is orthodox enough for me. I mean that I am willing to make that creed the basis of union in Christian work. Are not you?"

"I'm not at this moment prepared to say that I would not."

"I trust," said the banker, drily, "that you never will be any better prepared than you are at this moment."

The club discussed the proposed convention vigorously for an hour, and then, no one dissenting, the committee was appointed and the call was speedily issued. The object of the convention, as stated in the call, was "to promote union and efficiency in Christian work, and to secure a more systematic evangelization of the destitute neighborhoods throughout the county." The organization effected was simple. It was named "The Christian League of Bradford County." The only permanent officer was the secretary. An Outlook Committee of five was to be appointed at each meeting, whose duty it should be to make inquiry respecting the feeble churches, and to secure, so far as possible, coöperation or consolidation. Meetings were to be held twice a year, on the first Tuesdays of April and October. Papers and addresses showing the waste and mischief caused by sectarian divisions and the need of unity were to be

provided by the Outlook Committee for each meeting. The principal object of the League, as defined in the preamble, was "to generate and disseminate right opinions respecting the duty of Christians to coöperate, to see that the waste places are cultivated, and to extend the fellowship of all believers to those churches that have no denominational fellowship."

There was some hesitation, at first, about this project; but the representatives of the New Albion churches all threw themselves into it with such heartiness that the doubts and scruples of the rest were vanquished, and the constitution was adopted with some enthusiasm.

Not many days after this, a letter from Monroeville invited a deputation from the churches of New Albion to come up and hold a public meeting in the interests of Christian union. The three ministers who had part in the accidental conference in Dr. Sampson's study responded to this call, taking with them Dr. Strickland, of the Episcopalians, and Elder Bates, of the Adventists. They found the Town Hall crowded with a curious and not very sympathetic assembly. It was evident that there were not a few of these auditors who were quite of the mind of the historic deacon: they were ready to be convinced, if they were in error, and would like to see the man that could do it. But the New Albion delegation had no misgivings. They knew that the idea they advocated was right and reasonable, and they talked like men who expected to carry their point. The speech of the evening, all things considered, was that of Mr. Hartwell. Several years of his earlier ministry had been spent in these small towns, and he spoke from a full experience of the evils of sectarian division.

"I never was in Monroeville before," he said; "but I have lived in towns just like it, and I can tell something about the state of things in this town which will be no news to you, but which it may do you no harm to hear. Your five little societies, living here at a poor, dying rate, do not have a very good time. You cannot live without help from outside; that is confessed. With all the help you can get, none of these churches is able to offer its pastor a decent living. The salaries are so small that the grade of men you are able to secure is extremely low. Now and then a man of good gifts and great fidelity, like the venerable pastor of the Baptist Church, settles in a town like this and stays many years; but the great majority are young men who will not stay more than a year or two, or men who have failed everywhere else, and who sometimes fasten themselves on you and give you

plenty of trouble in getting rid of them. The Methodists have a way of managing such cases; but the Methodist Churches in these small towns rarely keep a man through the three years that the discipline allows, unless he is a man they do not want. Is not that true?

"The consequence is that your Christian work is poorly done. Many waste places in the corners of these towns are sadly neglected, and are becoming rapidly heathenized. The religious wants of these communities are not so well provided for as they were in the days when there was but one church. You say that you are sending down to the cities a constant stream of your young men, and that is true; but the young men that you are sending us now-a-days are not of so good a quality as those you sent fifty years ago. The young men of your town do not get so much benefit from your churches as they got fifty or sixty years ago. How can they? What have you here to attract the attention and command the respect of intelligent young men? Your feeble, half-alive churches, that struggle for existence and are afflicted with chronic debility, do not strongly appeal to the enthusiasm of young men.

"The social life of your town is marred by these hateful divisions. The people of each church are a little clique; there are not enough of them to make it lively when they get together; petty sectarian jealousies keep you apart. If the Methodists have a fair or a supper, very few go but their own folks; if the Congregationalists try to have a course of lectures they must depend mainly on their own congregation for an audience. Of course there is some denominational reciprocity, but it is limited. The barrenness of your social life is largely due to these sectarian divisions. They constitute one of the principal reasons why life here is undesirable—why people, especially young men, get away as soon as ever they can.

"So, then, even as things are now, with all the help you are getting, I am sure that you yourselves can see that you are not succeeding in doing for your town, with your present machinery, what needs to be done.

"The devotion and the earnestness of many men and women here is worthy of all praise; but the results of their work, as they will admit, are meager and unsatisfactory. If, then, things could go on upon the present basis, there would not be much encouragement in the prospect; but I am bound to tell you that I doubt whether things can go on much longer upon the present basis. I do not believe that the Christian people of the country will be willing much longer to contribute money for

the perpetuation of these sectarian divisions. Many are beginning to see pretty clearly the foolishness and sin of them, and to demand that they shall cease. This is a fact to which you must give due heed. You are wise enough to make a virtue of necessity.

"Think, if you can, how much better it would be to have one religious society here instead of five. You could have one good church edifice; you could take the largest and best of your three and renovate and beautify it for your place of worship, and fit up one of the others for a lecture hall and for other social purposes. You could have one first-rate minister, and pay him a good salary, and not need to beg a cent of it from anybody. You could have your pick of all the singers in town for your choir. You would have one fine congregation,—large enough to make preaching, and listening, too, much more inspiring. Your minister would be likely to remain with you several years,—long enough to get acquainted with the absentees of the out-districts, to gain their friendship, and to mature plans of successful work among them. Your social life would be improved. By combining all your forces you could have singing schools, concerts, courses of lectures, reading circles, various literary and musical diversions of an excellent character. Monroeville would be a pleasanter place to live in; people would not be in such a hurry to get away; property would cease to depreciate.

"What is the condition of all this gain? Simply that you should drop your small, sectarian prejudices, and begin to be what the disciples were called at Antioch—Christians, nothing more nor less. Simply that you should learn to love Christ and his cause better than you love your own pet peculiarities of doctrine or worship. Is that impossible? Does anybody mean to say that the members of these churches in Monroeville are so narrow and obstinate that they cannot make so small a sacrifice for so great a good; that they will insist on maintaining, in a town of eight hundred inhabitants, five separate starving sectarian organizations instead of one vigorous, Christian church? Does any man tell me that the people of Monroeville, after coming together and looking this question in the face, are going away to say, 'It is of no use; we are too selfish and bigoted; we cannot live together peaceably; we must stick to our separate churches, though they perish, and religion and virtue and social life perish with them?' No, my friends. I have a better opinion of you. You have remained in this unhappy condition because you saw no good way out of it; now the way is open and you will walk in it."

Mr. Hartwell's speech carried the day. A

committee, consisting of the pastor and two members from each of the societies, was named on the spot and instructed to mature a plan of consolidation, to be presented to each of the churches. Within two months all the old societies had been disbanded, and a new one formed under the style of Unity Church. The meeting-house of the Congregationalists, which was largest and most central, was retained as the house of worship; that of the Baptists was refitted as a social hall, and that of the Methodists was purchased by the town for a school-house,—the money thus obtained being devoted to a renovation of the other houses. The Apostles' Creed served the new church for its confession of faith, and its organization was in most respects similar to that of the church in Cyprusville. Mr. Slade easily found another field of labor in Kansas; the end of the conference year terminated Mr. Towne's stay in Monroeville, and Elder Crane, who continued to reside in the town, gratified the universal wish by taking charge of the new organization until a pastor could be found. The behavior of the good old clergyman in all this experience was eminently judicious and Christian. His rhetoric was turgid and his opinions were not modern, but his heart was sound and the people loved him.

Thus it was that five feeble bands of sectaries in one small town were united into one efficient and self-supporting Christian church.

## XII.

A LITTLE more than two years after the Union mass-meeting in the Town-Hall at Monroeville, on a delightful October evening, Old Major stopped at the parsonage door, and the parson took his seat in the open buggy.

"Let's see; how long have you been gone?"

"Eighteen months next Monday."

"And you've seen pretty much all that's worth seeing of Europe, Asia, and Africa?"

"Not quite, but enough to think of for some time."

"And you're thoroughly rested and well?"

"Never was so well in my life."

"Good! We were very anxious about you at first; but the later news comforted us. The people have taken solid enjoyment all the while in the knowledge that you were resting and recovering your health. They will give you a hearty welcome at the prayer-meeting to-morrow night."

"Bless their faithful hearts!" said the parson, his eyes filling. "How gladly will I spend and be spent for them in the coming days! But tell me the news. I've had family news often, and church news now and then,

but beyond these almost nothing. How goes the Club?"

"Gloriously! It is pushing right on to conquest. At every meeting we have news of some good fruit that has grown from its sowing."

"How fares the work among the poor?"

"We've got that into excellent shape. Mendicancy and pauperism are pretty effectually suppressed. There are no more beggars at our back-doors; the tramps give us a wide berth. We hammered at the overseers of the poor till we got them to stop their careless largesses of alms to the idle and the vicious; they employ our visitors, now, to investigate their cases, and the amount of out-door relief has been reduced sixty per cent."

"But I hope you haven't ended with suppressing pauperism."

"Oh, no. Our visitors are beginning to take hold of the work of caring for the sick and of helping the poor and the discouraged and the shiftless, in a most intelligent way. The work that has been accomplished, not only in ministering to the helpless, but in lifting up degraded families, and in inspiring the miserable with hopefulness and courage and self-respect, is the most genuine Christian work that has ever been done in New Albion."

"How about Dr. Strickland's kindergarten?"

"There are three of them now, all doing excellently."

"The Young Men's Club—is that thriving?"

"It has a membership of six hundred."

"And the County League—how is that flourishing?"

"Now you begin to get down to business with your catechism. The County League, sir, has its foot upon its native hills, but its fame has gone into all the earth. Didn't you hear of it in Moab?"

"Not a syllable," answered the parson, laughing.

"Well, sir, the Moabites may as well set their meeting-houses in order, for it will be after 'em shortly. See. You helped to reconstruct Monroeville. Scantico followed suit; but that was before you went away. Then the Outlook Committee got its eye on Rowell and began to put on a gentle pressure. The result there was different from that in the other two towns. The Methodist church was pretty strong—much stronger than either of the other three, and the committee recommended elimination by subtraction, instead of substitution. The Methodist Church kept its organization, but broadened its methods somewhat, and the other people gave up their own churches and went in with the Methodists. Of course the Methodists did everything they could to make it agreeable for the others; put them into offices, got

a quiet, broad-minded man for their next minister, and exercised a real Christian hospitality in their reception of the members of the other churches. I hear that they have all learned to sing the Jubilee song:

“‘A Methodist, Methodist will I live,  
And a Methodist will I die,’

with the spirit and the understanding also. That's Rowell. In Woodford the Baptist Church was found to be the fittest to survive; the Baptist minister exchanges once a month regularly with the Rowell minister, and then the Baptists in Rowell who can't commune with the rest have a special communion service, and the Pedobaptists in Woodford who want their babies baptized have that service performed for them at their houses. In Tuckerton and Millville, union churches have been formed; and, of the towns in this county where small populations were once split up among several feeble churches, all but two are now happy in the possession of one good church. Besides, our Outlook Committee has been spying out the neglected districts, and stirring up the people of the towns to occupy them; we have reports from them in the meetings of the County League, and I am sure that a great many more people in Bradford County are now under religious influences than there ever were before.”

“Good!” shouted Mr. Strong.

“But you haven't got the whole of it yet,” said Franklin. “To the next meeting of the County League, after you went away, a delegation of Dunham County folks, from Samsonville and Knox and other places came in, and they got into the spirit of the movement, and went back and formed a Christian League in Dunham County. The matter began to be talked about all over the State. The newspapers took hold of it, and pushed it hard; the business men perceived the reasonableness and justice of it, and made their influence felt in favor of it, and soon every county in the State had swung into line. Midland County was the last to organize, and their League was formed last April, five months ago. And week before last the secretaries and Outlook Committees of all the County Leagues held a meeting in Bradford, and formed ‘The Christian League of Connecticut.’ Its object, as stated in the constitution, is ‘to promote efficiency and economy in Christian work, by the suppression and extinction of superfluous organizations, by the occupation of destitute fields, and by the concentration of the efforts of Christian people.’ We are to have one mass meeting every year, in November, to

hear reports from the county secretaries, to read and discuss papers, and to devise measures for the prosecution of our work.”

“*Laus Deo!*” exclaimed the parson. “Who would have believed it? Why, this is more of a miracle than your telephone, that has sprung into being since I went away. *Gloria in excelsis!* The unity of believers in this commonwealth is no longer merely a sentiment, it is a solid fact. Have they heard of this yet up in Massachusetts?”

“Oh, yes, they are talking about it there, and out West, too. The West, you know, is a great deal worse sect-ridden than we are, and sensible people out there are beginning to see that they must organize to protect themselves against the nuisance. A keen fellow from Dakotah, a leading man in one of the churches out there, was in our bank the other day, talking it over. ‘Your Outlook Committees may do very well for this region,’ he said; ‘what we've got to have is a vigilance committee. I go in for hanging every man that proposes the second church in a town of less than five hundred people. On one of our railroads, the other day, away out on the prairie, fifty miles from anywhere, the surveyor got off the train to stake out a new town. He drove four stakes and went away to eat his dinner by a spring, and, I assure you, when he come back, there was a church extension agent a-sitting on every one o' those stakes—a Baptist on one and a Presbyterian on another and a Methodist on another and a Congregationalist on another. They'd all come to locate churches in the new town. That's about the way they do it,’ said my friend, ‘and they've got to stop it.’”

“That will pass, for Dakotah,” laughed Mr. Strong. “There are facts, no doubt, under your friend's hyperbole. But we will trust that something less sanguinary than a vigilance committee may serve to restrain the rampant sectarianism of the West.”

“Ay, ay,” cried the banker. “A little patience and sweet reasonableness, and a great deal of pluck and perseverance will do the business. Let people once see how much better and more Christian is coöperation than competition and conflict, in doing Christian work, and the battle is won.”

“I always knew that the millennium was coming,” said Mr. Strong slowly, resting his eye for a moment on the mingled pearl and gold in the cloudless sky, out of which the sun had just sunk, and then dropping it to take in the soft, purple haze of the hills, and the shining depths of the placid river: “I always knew that it was coming, but I never knew before just how it was coming. Now I see.”

## THE PLANTING OF NEW ENGLAND.

BY EDWARD EGGLESTON.

### I.

#### FROM SCROOBY TO PLYMOUTH.

IN 1606, about the time that King James was providing with regulations, but not with bread, the forlorn little colony that made the first permanent settlement in Virginia, a movement was in progress in one of the obscurest villages of his kingdom, without the king's knowledge, and in defiance of his commands, which was fraught with the highest significance for America. In Scrooby and the adjacent parts of Nottinghamshire and Yorkshire, New England was germinating in Old England. The men in big wigs—Kings, lord-archbishops, and such divinely appointed guides and guardians of English advancement—had no hand in the most notable development of English life and thought in their time. Only by their grinding and vexatious despotism did they contribute to awaken that Saxon stubbornness which planted in New England the spirit of democratic equality, and leavened with it the whole of the present United States. So that Brewster, the master of the post at Scrooby, and Bradford, a yeoman of the neighboring hamlet of Austerfield, who never, to the day of their death, had, in their following more than a few hundred artisans and laborers, have come to stand for more in human story than James and all his court. The divine right of fact and outcome is greater than that of Stuart pedigree.

Since the secession, in the time of Henry VIII., of the Anglican Church from the Roman, there had been two manner of people within her, and Jacob and Esau were striving for precedence. The conservative party, which included many devout people, wished to make few changes and to preserve ecclesiastical dignities, impressive ceremonies, and traditional usages. The extreme Protestant or Puritan party cried out against the retention of any rag of Romanism. They wished to revert to a primitive equality among ministers, and to assimilate modes of worship to those of the reformed churches of the continent, while they sought also to introduce a severe ecclesiastical discipline and a Scotch rigor in Sabbath observance. Each party strove to gain the ascendancy, each was ready to oust

and persecute the other. In the reign of Elizabeth many ineffectual compromises were attempted, and some of the more moderate Puritans were tolerated. But the Queen, with a calculated and worldly policy, sought to put down Puritans with one hand and Papists with the other.

When, in 1603, James VI. of Scotland, who among his Scotch subjects had shown himself an ardent Presbyterian, succeeded to the English throne as James I., the hopes of the Puritans were raised to the highest pitch. They met the king in his progress southward with a petition signed by nearly eight hundred clergymen. But when James was once freed from the "Scot's presbytery," as he called it, his opinions, so often vaunted, underwent a rapid change. Like Dickens's Bagstock, however, the king was openly and ostentatiously sly. After frightening the cringing bishops with a threat of doing away with their order, he summoned four Puritan divines to meet with nine bishops and seven deans in conference before him at Hampton Court. He delighted as much in the recreation of a puttering theological debate, as some of the Roman emperors did in gladiatorial slaughter. The Puritans found to their surprise that the real antagonist whom they had to meet was James himself, who started with the maxim, "No bishop, no king," and declared that he would "have one doctrine, one discipline, one religion in substance and in ceremony." He promised that he would "make the Puritans conform, or harry them out of the land, or else worse." Whereupon the courtiers, like good claqueurs, pronounced James a Solomon. The aged Whitgift, Archbishop of Canterbury, thought that the king spoke "by the special assistance of God's spirit." Bancroft, the Bishop of London, fell upon his knees, crying: "I protest my heart melteth for joy, that Almighty God, of his singular mercy, has given us such a king as since Christ's time hath not been." And indeed the bishop was partly right; it would be hard to find the like of King James, who may have furnished to the great poet of his reign the happy conception of a man unconsciously wearing an ass's head. The king wrote to a friend, when the conference was over, that he had "peppered the Puritans soundly," and the Puritans were no more able to dispute

his victory than was the lamb in the fable to reply to the cogent arguments of the wolf.

During the later years of Elizabeth's reign, and at the accession of James I., there dwelt at Scrooby, in Nottinghamshire, one William Brewster, who had seen the great world in his time, having been in the service and friendly confidence of William Davison, the queen's ambassador to Holland,—the same Davison who was later the unfortunate secretary of state on whom Elizabeth was pleased to throw the blame for the execution of Mary of Scotland. Brewster seems to have had some property, and he held the office of "Post" or master of the post at Scrooby. Brewster, like Davison, was a man of deep religious feeling and strong Protestant convictions. Desiring a reformation of the church by the abolition of those ceremonies which he considered to be of human invention and savoring of Romanism, he took especial pains to secure incumbents of his own way of thinking for the neighboring parishes. But when these revered men were silenced by episcopal authority, and their devout followers vexed with persecutions, Brewster, like many others, came presently to believe that "the lordly, tyrannous power of the prelates ought not to be submitted to." He thus passed from Puritanism to Separatism, and became what in that day was called a Brownist. And so, as one after another, the Puritan clergymen who officiated among the hamlets and wheat-fields about Scrooby were silenced for non-conformity, there grew up among those who had been influenced by their preaching, a Separatist congregation, meeting for the most part in the large old house of Brewster, which was a bishop's manor, surrounded by a moat. Here assembled all those scrupulous spirits who could not worship where the parson wore a surplice, read prayers from a book, and made the sign of the cross in baptism. These were trifles to fall out about, but they stood for more than they do now; they were outward signs of the great conflict between the middle age and modern life, priestly domination and human advancement. However slight the ground of scruple may be, the human conscience is no trifle; the strict Separatist defied king and bishop for what he deemed to be duty, and thus ennobled his life in joining the long line of martyrs and patriots. Turning his back every Sunday upon the picturesque and venerable churches of his forefathers, the humble husbandman took the foot-path that wound through lovely fields and along hawthorn hedge-rows until it brought him to Scrooby, to the house of the post-master, revered by him as the Ruling Elder of the true believers who had separated themselves

from the corrupt Babylon of the bishops, with all its "base, beggarly ceremonies," which in his eyes were "monuments of idolatry." Here the worship was conducted with apostolic plainness. There was no reading of "stinted prayers" out of a book, but good, long, exhaustive petitions delivered extemporaneously. Even the psalm must not be read by the minister before it was sung, though, in after times, out of pity for one good brother, who loved to sing, but did not know letters, the elder was allowed to read it line by line, yet not until the minister had first expounded it.

Among those who assembled in this forbidden conventicle in "the mean townlet of Scrooby," was a young yeoman, who every Sunday walked some miles from the Yorkshire village of Austerfield. This was William Bradford, or Bradfurth, afterward the famous governor of the first New England colony. Though but a youth, he was of a contemplative spirit, and had probably already begun that self-instruction by which he came in his busy after-years not only to speak French and Dutch, but to read Latin and Greek, while he studied Hebrew more than all, because "he would see with his own eyes the ancient oracles of God in their native beauty."

The most memorable of all the men in the Scrooby church, and its most influential teacher, was one of its preachers who arrived late. Of a modest and conciliatory spirit, a man of charity and far-seeing liberality, John Robinson seems hardly to belong to those times of partisan bitterness. After he had been silenced we find him living in Norwich as "a man worthily revered of all the city for the grace of God in him." But when those who resorted to his house "to pray with him" were vexed and persecuted, he drifted, slowly and reluctantly, into a separatism that was never bitter, and that was softened and modified as he mellowed with years and experience. He became pastor to the Scrooby Separatists—a Moses who was to lead the pilgrims in their wanderings, but who was doomed never to see the promised land even from a mountain-top. It was he, no doubt, who gave to the Scrooby congregation a unity and affection rare among the aggressive spirits of the time; it was Robinson who held them firmly together in their exile; and, after their second emigration and his death, it seems to have been the influence of his character and teachings that made the Plymouth pilgrims more tolerant than the harsher Puritans of Massachusetts Bay.

Badgered on every side by that vexatious "harrying," which, according to promise, King James and his ecclesiastics kept up, the little congregation at Scrooby resolved to flee into Holland, where they would be strangers to

the local speech and means of gaining a livelihood, but where they might worship God in extemporary prayers without fear of pursuivants or prisons. That which is most honorable to the Dutch Provinces from the standpoint of history, namely, that they were places of refuge for oppressed consciences, was thought ridiculous and abominable in the seventeenth century. The Dutch capital was called "a cage of unclean birds"; an English prelate denounced it as "a common harbor of all opinions and heresies," and Edward Johnson, the somewhat bloodthirsty Massachusetts Puritan, inveighs against "the great mingle-mangle of religion" in Holland, and like a burlesque prophet, shrieks: "Ye Dutch! come out of your hodge-podge!" All the hounds of bigotry stood baying at Amsterdam, a refuge wherein those upon whom they would prey were safe from their fury.

To this asylum, the Scrooby Separatists resolved to fly. They found themselves "hunted and persecuted on every side," vexed with fines, arrests, and imprisonments, having their houses watched "night and day," so that all their sufferings in the previous reign "were but as flea-bitings in comparison." But the tyranny which made England intolerable, did its best to render flight impossible. The Dutch captains who were to carry them were paid to betray the fugitives, so that in various essays to escape they were arrested and stripped of their valuables, and their leaders were cast into prison for months at a time. In one attempt to take ship secretly at a country-place, it happened that the greater part of the men were taken aboard during low water, to save time, while the women and children waited the turning of the tide. Seeing an armed company approaching, the Dutch captain swore the customary oath of his class "by the sacrament," and heartlessly set sail, carrying off the men, who were in the greatest anxiety, and leaving the women and children to the mercy of the officers. The constables, for their part, knew not what to do with so many helpless and innocent people crying after their husbands and fathers, and shivering with fear and cold. These guiltless culprits were dragged from magistrate to magistrate; to imprison women for wishing to go with their husbands was unreasonable and even difficult, when once the pity of the populace had been excited. It was equally unreasonable to bid them return to their homes since they had disposed of their houses and livings. So there was nothing for the perplexed magistrates but to get rid of them at last by letting them escape to their friends, who, meantime, had well-nigh perished in a storm which drove them to the coast of Nor-

way and kept them out of port for fourteen days. But at length, this battered little community, which had attained increased solidarity by common sufferings, met together with joy in Amsterdam. Here they soon saw "the grim and gristly face of poverty coming upon them." To make matters worse, the English Separatists who had preceded them to Amsterdam were in bitter strife among themselves about some scruples on the subject of high-heeled shoes and bodices with whalebones. Robinson valued peace above phylacteries, and the Scrooby people, to avoid the contagion of discord, struck their tents once more and removed to Leyden, where their opportunities for gaining a livelihood were even less than at Amsterdam. Their occupations were of the humblest sort. Even the learned and famous puritan Dr. Henry Ainsworth, who had gone to Amsterdam from London, had found no work more congenial to his scholarly tastes than that of carrying knowledge upon his back as a book-seller's porter. Young Bradford apprenticed himself to a refugee Huguenot to learn silk-dyeing, and Elder Brewster, whose property had been wasted by the troubles attending the emigration of his large family and the assistance he had given to others, set up as a teacher of English; and though, like the young man in Goldsmith's story, he might have found it hard to teach the Dutch to speak English, since he himself knew no Dutch, yet as Leyden was a university town, where Latin was a common tongue of the learned, he succeeded well, and became prosperous in a small way, by writing a grammar of English in the Latin tongue, stretching the rather grammarless Saxon upon a Roman frame. Later, by the help of friends, he set up a printing-office, and published puritan books that could not have been printed in England. With one hard shift and another, guided by Robinson's talent for affairs, the country-people from the north of England succeeded in winning their bread "by continual labor and toil," while they lived together "in single-heartedness and sincere affection."

Robinson's erudition and gifts brought him into some credit among the learned in Leyden in 1615, and he was admitted to the University. This freed him from the control of the magistrates, and gave him another inestimable privilege of learned Dutchmen,—that of receiving every month half a tun of beer and ten gallons of wine, free of town and State duties. He took part with distinction in the unhappy debate between the Gomarists and Arminians, which culminated in the persecution of the latter; but he lived and died in poverty, the Dutch authorities not giving him any preferment, from fear of offending

OLD PARISH CHURCH IN AUSTERFIELD.

the English king, who could not let the victims of his petty spite find rest even in Holland.

When the little Separatist congregation had dwelt in a foreign land ten years, they began to grow dissatisfied. They had ceased to increase, and the life in Leyden was so hard that many even preferred English prisons to liberty at so high a price. It is not in the nature of things that a sect whose members hold their opinions with warmth should be content to dwindle, and it seemed probable that this little church could not long keep together against the pressure of adverse circumstances, and with the prospect of a renewal of the war between Spain and the Low Countries. It pained them to see their children growing prematurely decrepit under the weight of hard and incessant toil, "the vigor of nature being consumed in the very bud." Some of their young people were drawn aside by the licentiousness of the city, some entered the Dutch army, others made long voyages at sea, and fell into habits very foreign to the strictness of their parents. There could be no doubt about the result of a contest between the spirit of the lax and merry Hollander and the severity of Puritan discipline. Human nature, indeed, will not stand at too high a pitch; all strenuous movements are softened by time. There could be but one hope of holding the posterity of the pilgrims to their rigid religious principles, and that was in isolating them. Intermarriages with their Dutch neighbors had already begun, and this opened before the Separatists the prospect of losing in the next generation their language, their religious principles, and their very existence as an English community. Then, too, Puritanism was in its very nature aggressive, even meddlesome; and it was not possible for a church with Puritan principles, that held such men as Robinson, Brewster, Carver, Bradford, and Cushman, to remain content where language and national prejudice prevented the

exertion of a positive influence. They were captivated with the idea of planting a new state, where, according to their declared intent, they "might, with the liberty of a good conscience, enjoy the pure Scriptural worship of God without the mixture of human inventions and impositions; and their children after them might walk in the holy ways of the Lord." There was much discussion in the Separatist church in Leyden, of the wisdom of the proposed migration, and much debate as to the direction of their removal. Guiana, so highly praised by Raleigh, tempted them with its perpetual spring, but it was too near to the cruel Spaniard, who had so recently tormented the Protestants of the Low Countries, and from whom Leyden itself had suffered so fearfully. There were tedious negotiations with the Virginia Company, which were broken off because King James refused to offend his conscience, or, perhaps, feared to wound his reputation for orthodoxy, by granting toleration to the Separatists in their new colony. He would connive at their worship if they carried themselves peaceably, but to give them a formal guaranty of toleration under the broad seal of England—never! They now turned to the Amsterdam Company, trading in the Hudson River, which gladly offered them a free passage to New Netherlands, and proposed to supply them with the necessary cattle, but could not secure from the States-General a guaranty of protection from King James's royal arguments against heresy. But before this decision was reached, the eyes of the pilgrims seem to have been turned again toward England, by the proffers of a co-partnership in their enterprise from certain London capitalists or "adventurers," as investors were then called. On mature reflection they thought it better to form an English colony, even without the guaranty under the broad seal, reflecting that "a seal as broad as a house-floor" would not hold a king to his promise if he desired to evade it.

In their application for toleration they had laid before the English privy-council a somewhat diplomatic statement of their religious principles, urging at the same time, in well-chosen phrases, their fitness for planting a successful colony, since they were "well weaned from the delicate milk of their own country, and inured to the difficulties of a hard and strange land," and since their people were, "for the body of them, industrious and frugal as any people in the world," and knit together in the care of one another under a sacred bond, and since they could have no temptation to return to the persecutions of England or the poverty of Holland.

They procured a patent from the London

EDWARD WINSLOW. [BY PERMISSION OF THE MASSACHUSETTS HISTORICAL SOCIETY.]

or Virginia company, to settle in the neighborhood of Hudson's River, a geographical phrase which, in the vague state of knowledge at that time, meant nothing very definite. The colonists saw plainly that the battle would be a severe one, and there were those among them whose hearts failed. The younger and stronger were sent before, and only the willing-hearted. Some prudently left their wives and children behind until the first rude brunt should be over. More than half were willing to go, but not quite half could get ready in time, and so it fell to Robinson's lot to stay with the larger number, as had been agreed, while the ruling elder, Brewster, embarked with the smaller division.

As the time drew on for one of the most memorable leave-takings in human history, a day was appointed for humiliation and prayer. With the true hardihood of men inured to religious services, they continued the exercises the livelong day. A good part of this time was occupied by the pastor's excellent discourse—the rest with many tearful prayers. It was, perhaps, on this occasion that Robinson gave the never-to-be-forgotten farewell advice, which shows him to have been a man of rare moral exaltation, and one of the most liberal minds of the seventeenth century. Thinking it possible he might never see them again, he charged them “before God and his blessed

angels to follow him no farther than he followed Christ, and if God should reveal anything to them by any other instrument of his, to be as ready to receive it as ever they were to receive any truth by his ministry; for he was very confident the Lord had more truth and light to break forth out of His holy word. He took occasion also miserably to bewail the state and condition of the reformed churches who were come to a period in religion, and would go no farther than the instruments of their own reformation.” The Lutherans he censured for refusing the truth of the Calvinists, and these for sticking where Calvin had left them,—“a misery much to be lamented.” It would be hard to find at that day any other professed theologian or teacher of any kind, who understood as he did the progressive nature of truth as apprehended by the human intellect. He declared it “not possible that \* \* \* full perfection of knowledge should break forth at once.” He exhorted them to shake off the sectarian nickname of Brownists, to

avoid separation from godly people of the Church of England, and “rather to study union than division.” He bade them not to be loth to call another pastor or teacher, “for that flock which hath two shepherds is not endangered, but secured by it.” Admirable man!—free from pettiness and egotism! Fortunate man, who, working in one of the obscurest corners of this jostling world, succeeded in training and sending out a people that expanded and diffused his teachings into the institutions and habits of thought of a great nation! It matters nothing that the poor remainder of his people in Leyden, five years later, could only afford for this great and learned man the fourth part of a hired tomb costing but nine florins. Nor does it matter that, at the end of seven years, his body was removed with the others and cast into some common fosse. He who plants the seeds of new and better institutions may well have his place of sepulture as obscure as that of Moses.

The last night of the stay of the pilgrims in Leyden was passed almost without sleep. Those who were to remain gave a feast to the “removers” in the large house of the pastor, where, it seems, their services were usually held. Here the night was spent in such social enjoyment as became people of their severe habit. For the last time they sang together the rugged verses of those psalms that were associated with all the intimate brother-

hood of many years in Scrooby and Leyden. Governor Edward Winslow, a quarter of a century afterward, looked back fondly to that parting Puritan feast, and professed that there was the most delightful music he had ever heard. In the hearts of emigrants the quaint psalms were answered by the pathetic melody of a fellowship to be sundered forever, and the heroic strains of brave souls ready to venture all in the execution of a high resolve.

"And so," says Bradford, as if writing a new sacred Scripture, "they left that goodly and pleasant city which had been their resting-place near twelve years; but they knew they were pilgrims, and looked not much on these things, but lift up their eyes to the heavens, their dearest country, and quieted their spirits."

Their friends from Leyden accompanied them fourteen miles to Delft-haven, where their little ship, the *Speedwell*, awaited them. Some of the Separatists of Amsterdam came likewise to the port, and here there was another feast. Then followed the indescribable parting, the Dutch spectators on the quay shedding tears at the sight. Words were few. "They were not able to speak to one another for the abundance of sorrow," says Winslow. But at length Robinson's voice was heard in prayer, and around him they all knelt for the last time while he commended the emigrants to the keeping of God. Like true Englishmen, the pilgrims did not forget the proprieties of a public occasion; those on board the shabby little *Speedwell* fired a volley of small shot as a farewell to the friends on shore, and, with this beggarly show of ceremony, one of the most important migrations of the world's history set forth, in July, 1620.

On the English coast they were joined by others, and by the greater of their two ships, the *Mayflower*. There were many vexatious delays, and the leakiness of the *Speedwell* forced them to put back twice, and finally to abandon her. Whereupon, leaving behind all the discontented and faint-hearted, the one hundred who adhered to the enterprise crowded themselves and their most necessary supplies into the *Mayflower*, a ship of a hundred and eighty tons, whose bad condition came near putting an end to the whole expedition. These were huddled together so densely that even the shallop on the deck was damaged by being used for a sleeping-place. They had a stormy and wretched passage. They were wet almost continually, lived upon spoiled provisions, and were out from Plymouth, their last English port, more than sixty tedious days, falling in with land in November, not within the limits of the Virginia Company, from whom they held their charter, but among the embarrassing shoals of

Cape Cod. They essayed to sail to the southward but the captain seemed not to be able to find his way through the shoals. The voyagers were sick of the discomforts of the ship and the perils of the sea; the women and children could not understand why one wilderness was not about as good as another. Here was land, with none to forbid the taking of it, and the clamors to be put ashore were irresistible. So they turned about and dropped anchor in Cape Cod Harbor, and thus it chanced that Puritanism, instead of planting itself in fertile lands farther to the south, was driven by rough winds to the shores of New England, where the austere creed, the reluctant soil, and the rugged climate contributed to form that remarkable people who have had so large a share in shaping the character and history of the United States.

## II.

### THE PLANTING OF NEW PLYMOUTH.

THE pilgrims were not the first who had essayed to plant the coast of New England. Sir Humphrey Gilbert's fatal expedition of 1583 would no doubt have made an attempt here, had not a succession of disasters reduced its strength from five ships to two, of which but one reached England at last. In 1602 Captain Gosnold, the same who afterward projected the Virginia colony, planted a little company for a few weeks on the island of Cuttyhunk, to the south of Cape Cod. He not only chose an island, but, to make safety more secure, an islet in a lake in the midst of the island was selected, and thus, doubly surrounded by water and land, the colonists built a sort of fort, and a common house large enough for twenty men, with their necessary stores. But, unfortunately, the ship took on a rich cargo of sassafras and cedar-wood, and the eleven men who were to remain suspected that the ship's captain, Gilbert, did not intend to bring them supplies the next year. They believed that, with the cruel dishonesty which was often found in the half-piratical mariner of that time, he proposed to leave them with six weeks' provision, and to appropriate the results of the voyage. The eleven men, therefore, hastily resolved to go back to England with him, that they might share in the profits from the sassafras. The coast of Buzzard's Bay was seen by them at the loveliest season of the year, and with six hours' fishing they "so pestered" their ships with codfish that many were thrown over again. Their good report of the land, with the account given by Captain Weymouth, who sailed up the Kennebec in 1605, and kidnapped five

savages for the glory of God, were no doubt chief influences in moving Sir John Popham, Lord Chief-Justice, "honorable patron of virtue," and hard-hearted persecutor of Puritans, to send out a plantation in 1607, into what is now the State of Maine. But the governor of this colony died, and the ships which brought supplies the year following brought also intelligence of the death of the Chief-Justice, and news of another death which made Raleigh Gilbert, the new governor, inheritor of large estates. No mines had been found, and the colonists were homesick and discouraged by

England winter, and their nearest civilized neighbors were five hundred miles away. "All things stared upon them with a weather-beaten face," says Bradford. The mariners reminded them of the wasting provision and muttered threats of putting them off and leaving them, if they did not soon find a place.

When they had come to anchor, the men went ashore to refresh themselves, while the women took this first opportunity to wash the clothes, "of which they had much need." There is no surer sign of civilization in a race, than the waging of continual war against

GOSNOLD'S ISLAND, CUTTYHUNK.

the frightful severity of the winter of 1607-8, in which they had suffered "extreme extremities." They therefore returned to England, carrying hard reports of the climate, and of a land so forlorn as not to possess gold-mines, to pay the charges of colonization.

"For any plantations there were no more speeches" for a long while after. The indomitable Captain John Smith tried to found a colony with sixteen men in 1615, but was captured by a French privateer, and after many adventures landed in France. There were other attempts, and many disastrous voyages of one kind and another, so that a belief became current that the Indian conjurors, who were known to be the devil's own, had laid a spell on the coast to keep the whites away. It is probable that the enchanted region would long have lain waste, if the pilgrims, seeking Hudson's River, had not hit upon Cape Cod.

Safely anchored in Cape Cod Harbor, the weary voyagers gave solemn thanks for their arrival. But how much better was the wild land than the wild sea? They had "no friends to welcome them, nor inns to entertain or refresh their weather-beaten bodies." They were homeless at the beginning of a New

dirt. Since the world began, New England had never known a race that kept sacred a wash-day; and the well-washed linen of the pilgrims, fluttering on the bushes of Cape Cod, was the banner of approaching civilization.

Sometimes on foot, sometimes in a little shallop, a company of about sixteen explored the coast for a place of settlement, sleeping at night with no shelter but a barricade on the windward side, in such exposure to an unaccustomed climate as planted the seeds of death in the enfeebled bodies of some of them. It is a strange picture we get of them, sailing or marching about the creeks and bays, overloaded as they were with heavy armor, and carrying for the most part cumbrous matchlock guns, which could not be set off without access to fire, or the continual bearing of a lighted slow-match while on the march. They looked with fresh and child-like eyes on the novel objects which this virgin world offered to their curiosity. The cunningly built canoes of birch-bark, and the deserted wigwams which they found filled them with wonder, as did the fresh, sweet spring water of the country, so superior to any they had known in Europe, and the

ARMOR WORN BY THE PILGRIMS IN 1620.

wild geese, which they ate "with soldiers' stomachs." Buried in an Indian hiding-place, they found, to their delight, the yellow, red, and blue-speckled ears of Indian corn, and pronounced them beautiful. They carried off as much of it as they could, intending to pay for it when they should find the owners, as they afterward did; the rest they conscientiously replaced in the subterranean granary. The corn thus procured served them for seed the following year, and since they would probably have perished without it, they set down its discovery as one of God's wonderful providences: so, indeed, they regarded all that befell them, good or bad. In spite of the dire extremity of their situation, they kept the Sabbath rigorously, nor did they omit their accustomed worship in any comfortless camp. They were once set upon by Indians, but they fought and routed them.

Lighting on Plymouth Harbor, they ac-

cepted it as a place suitable for planting, and here, on the twenty-fifth day of December, 1620, Old Style, while England was making merry over boars' heads and plum-puddings, they began to build, not even remarking in their journal that it was a holy day, for Christmas had been put away with all other popish superstitions and idolatrous observances.

In the old days of national self-laudation, now happily passed away, American writers were prone to make much of the compact signed in the cabin of the *Mayflower* as the foundation and beginning of all government "with the consent of the governed." The facts are that the Pilgrims found themselves so far to the north as to make their patent from the Virginia company of no avail, and one or two evil spirits having "shuffled into their company" in England, some mutinous speeches were heard. The emigrants took the only common-sense road out of the difficulty by signing a mutual

agreement to form a body politic. Without having any profound or fine-spun theories, the Pilgrims put in force the divine right of common sense. Republican institutions in America were merely the result of the application, first and last, of practical shrewdness to the wants and circumstances of the people.

Those enthusiastic writers who will have it that the pilgrims from Leyden were the real founders of the English dominion in America, wrong the brave men, Gosnold, Smith, Percy, De La Warre, Dale, and others, who carried to success the ill-starred colony at Jamestown, failing which costly attempt there might not have been another English plantation in a century. In such an event the northern coast, which was

ica was the democratic spirit. The equality of man to man in affairs civil and ecclesiastical was sown broadcast in the church government, the land system, and the town-meetings of New England. With them Democracy was not primarily a political doctrine, but an unforeseen result of their notions of ministerial parity and Christian brotherhood.

### III.

#### THE VAN-COURIERS OF NEW ENGLAND.

THE fiery furnace of their afflictions was lighted from the day of the pilgrim landing. The beef and pork they had eaten at sea was tainted, "their butter and cheese corrupted"

PLYMOUTH AND PLYMOUTH HARBOR FROM BURIAL HILL.

accounted in England "a cold, rocky desert," might easily have been occupied by the French, who claimed and tried to settle it as part of Canada, or by the Dutch, who had, in 1614, explored the shore to a point beyond Boston harbor, and included it in their chart of New Netherland. The Spanish imagination pushed their Florida indefinitely to the northward,—certainly to the Chesapeake, of which they were probably the first discoverers. But the dawning prosperity of the James River Plantation turned the eye of the pilgrims toward Virginia, and led them, while fearing their old Church-of-England enemies at Jamestown, to take a patent for a separate settlement under the same company. What the pilgrims did bring to Amer-

and "their fish rotten." In going to and from the land at Cape Cod they had been often wetted, some had endured storms in explorations, and their houses, their clothing and their bedding were quite insufficient to repel a New England winter. Neither the sick nor the sound had at any time during the winter a sufficient diet. Forty-four of the one hundred died before the winter was over, and quite one-half of all who landed had been buried before the supply-ship arrived at the end of a year. Lest the Indians should discover this mortality they leveled every grave, and set their maize and beans on the ground planted already with the bodies of half their colony. At one time there were but six or seven well persons, and these toiled incessantly for the sick, of whom

sometimes two or three died in a day. It was the Jamestown horror repeated.

But even this cruel mortality, according to Cotton Mather, is to be set down as a marvelous providential interference in their behalf. "If disease had not more easily fetched so many away to heaven," as he glibly says, there would not have been provision enough, and so all must have died before supplies arrived. But when Robinson, their pastor, heard of the death of so many, it wrung his heart, and he did not so cheaply explain the calamity, but, after expressions of the deepest sorrow, he bravely and philosophically reminded them that, "in a battle it is not looked for but that divers should die."

The crew of the *Mayflower* were sick of the same scurvy, and the ship lay at anchor the entire winter. But, when she sailed for England in the spring, after a winter so terrible, none of the colonists offered to return. There was not a family that had escaped loss: they compared themselves to the Egyptians after the death of their first-born. Nearly all of the leaders had lost their wives, and most of them had suffered cruelly in their own persons. But the new element of religious exaltation had come into the work of colonizing the continent. These were not covetous traders, nor dumb cattle to be held in place by military law. They willingly laid down their lives that they "might be stepping-stones to others," as one of them expressed it.

It was fortunate for the pilgrims that the Indian tribes of the vicinity had been almost exterminated three or four years before their coming, by a cruel epidemic, which had destroyed nineteen in twenty of the savages, and had quite exterminated the inhabitants of the village of Patuxet, on whose site Plymouth was built, leaving the cleared corn-ground for the use of the English. The Indians who remained in the neighborhood were bitterly hostile to all white people, and their "powows" or medicine men had held a three days' conjuration in a dark swamp, to persuade the evil spirits to work harm to the Plymouth settlers. This enmity came from the act of one Hunt, a despicable sea-captain of the sort so common at that time, who was engaged in a fishing and trading venture under the lead of Captain John Smith, in 1614. After Smith had returned to England in a bark laden with fish, Hunt bethought him of a new method of making money on his own account. The savages at Patuxet had maintained friendly relations with Smith and his party, and Hunt easily persuaded twenty of them to board his ship, whereupon he sailed away. Capturing seven others at another place, he set out for Spain,

where he sold some of them. But some benevolent monks of Malaga, hearing of his treacherous dealing, seized the rest of the Indians for the purpose of instructing them in Christianity. A number of these captives were by some means carried to England, and among them was Tisquantum, a native of Patuxet. He may have been a village or subordinate chief; at least, he contrived to figure as some great body among the English, and was sent out with an expedition to Newfoundland, whence he was carried back to England, to aid in an expedition under Captain Dermer, which was intended to make peace and reopen trade with the Indians whom Hunt had rendered hostile. On coming to Patuxet, after a five years' absence, Tisquantum, or Squanto, as the English called him, found it wholly deserted. Every member of his band remaining after Hunt's capture had died of the epidemic of 1616 and 1617. He led Dermer to the village of Namasket, fifteen miles to the westward. Here the savages were so hostile to all men of Hunt's complexion, that Squanto had trouble to save the life of the captain who had brought him home. Squanto was, perhaps, afraid of a new captivity, since he did not venture into Plymouth until three months after his old home had been occupied by the Pilgrims, nor was he then the first to come. On the sixteenth of March, Samoset, a sagamore from the eastern coast, walked boldly and alone into Plymouth, and would have entered the large "common house" if the people had not prudently objected. He greeted them with the words: "Welcome, Englishmen!" speaking such limited and broken English as he had picked up in contact with fishermen on the Maine coast. Having been kindly treated, he next brought with him five messengers from Massasoit, the nearest head-chief, and afterward three others; with these last came as interpreter, Tisquantum or Squanto, who, finding the English seated on the corn-field of his own extinct band, stayed with them,—partly, perhaps, from that attachment to place so characteristic of the aboriginal American, and partly from a reviving affection for the English people, among whom he had lived so long, and among whom he would again have that importance so much desired by Indian vanity.

Squanto encouraged Massasoit's band to maintain friendship with the whites, by telling them that the white men kept the epidemic disease buried in the same magazine with the gunpowder. "Thus the tongue of a dog became serviceable to poor Lazarus," says Mather. It was he who taught the English how to manure their Indian-corn, by putting one

CHAIR OF CARVER, FIRST GOVERNOR OF PLYMOUTH COLONY.

or two herrings in every hill, and how to plant it as the Indians did, when the white-oak leaf was as big as a mouse's ear. He taught them to take fish in waters he had known from infancy, showing them where to get and how to use that which land and water afforded, and where to sail on trading voyages. When the settlers languished with scurvy for want of fresh meat, he got a good mess of eels by treading them out of the brook with his feet, and catching them with his naked hands. As guide, interpreter, and instructor of the English in their new environment, he was, as they phrased it, "a special instrument sent of God for their good beyond their expectation." He was not lacking in Indian cunning. By boasting of his influence with the whites, and the dangerous character of gunpowder and the epidemic which were their weapons, he sought to gain an influence in Massasoit's band that should quite supplant the chief's authority. To this end he endeavored to excite in Plymouth suspicions of Massasoit's fidelity, but he was thwarted by the Indian Hobbamok, a friend of that chief, who had also come to live and die with the English. The Pilgrims saved Squanto from Massasoit's vengeance, and, thereafter made a shrewd use of the jealousy between him and Hobbamok. Governor Bradford affected to trust one of the Indians, while the military leader, Captain Standish, would listen only to the other. In this way they protected themselves from the craft of either. Two years after the landing of the Pilgrims, while on a trading voyage with Bradford, Squanto was seized with an Indian fever

and died. He maintained his affection for the white people to the last, desiring to go to the Englishman's God in heaven, and bequeathing sundry things to friends in the colony "as remembrances of his love." "Of whom they had great loss," adds Bradford.

The neighboring chief, Massasoit, possessed that sort of undefined, fast-and-loose authority over his band which one sees to this day among the Indians, with a general ascendancy, or influential precedence, among the several bands that composed his nation or tribe. He had strong motives for friendship with the colonists, in his fear of powerful tribes against whom, since the epidemic had reduced his followers to a handful, he was no longer able to cope. His alliance with Plymouth put him under shelter of their dreaded firearms. He seems to have been an Indian of a somewhat exceptional character, in a measure free from the falsehood, cruelty, and treachery that are almost universal in the red race. "O my loving sachem! my loving sachem!" broke out Hobbamok when he heard that Massasoit was dying. "Many have I known, but never any like thee!" and then, addressing Winslow, he added: "While you live you will never see his like among the Indians. He is not bloody and cruel like other Indians. When angry he is easily reconciled with those that have offended him; he is reasonable, and will listen to the advice of obscure men. He governs better with few

THE MYLES STANDISH HOUSE, DUXBURY, MASS., BUILT BY HIS SON, 1666.

strokes than others do with many, and he is a true friend to those he loves."

The iron hand of the colony in dealing with the Indians, and with evil-doers along the coast, was their intrepid captain-general, Myles Standish, a small man, who was sneeringly dubbed by one who had felt the weight of his authority, "Captain Shrimp." He was agile, indomitable, and hot-tempered.

POT AND PLATTER OF MYLES STANDISH. [NOW IN  
PILGRIM HALL, PLYMOUTH.]

A Yorkshireman of a gentle family, he had been a soldier in the Low Countries, where he fell in with Robinson's congregation. Liking them, he settled in Leyden, without joining the church. He came to New England in the *Mayflower*, and led in all the military operations of the colony, going foremost in every dangerous undertaking. He was quick of decision, and prompt to act. He terrified Courbitant's hostile faction in Massasoit's tribe by surrounding a village in the night and taking all the inhabitants prisoners. A merchant named Weston having planted a colony of reckless English on the site of Weymouth, who had rendered themselves hateful to the Massachusetts tribe, some of the latter conspired to destroy Plymouth colony and Weston's settlement with the same blow. Massasoit gave information of the plot to the English, and even directed who must be executed by a sudden surprise, in order to cut off the heads of the conspiracy, and so prevent the attack. The danger was imminent, and Standish set out for Weston's colony under color of trading, though some of the Indians reported that the little captain was evidently angry inside. In the insulting carriage of the Indians Standish easily saw their intention to surprise and cut him off. Pecksuot, a stalwart chief, had

sharpened his knife on the back as well as on the edge. "This knife," said he, "has a woman's face on the handle. I have another at home; it has a man's face on it, for it has killed an enemy. After a while the two shall get married." Standish and his men fell suddenly on some of the defiant ringleaders, whose names Massasoit had given, and killed them with the knives which the Indians wore about their own necks. The little captain, with his own hand, stabbed to death, after a desperate struggle, the powerful and insolent Pecksuot. The measure was a harsh one, but the peril was very great, and Standish had few men. The mode of execution was that by which the Indians were accustomed to deal with such offenders: it was what Pecksuot intended, no doubt, for Standish and his companions. It is to be remembered, too, that the slightest reverse would have brought the whole power of the savage tribes upon the English. Robinson, in Leyden, was deeply grieved at this slaughter, and wrote: "Oh, that you had converted some before you had killed any." Standish carried the head of one of the Indians back to Plymouth, and stuck it up as a barbarous trophy. In extenuation, it is necessary to remember that, more than a hundred years later than this, Temple Bar, in London, was decorated with

INSCRIPTION ON SWORD-BLADE.

human heads. Weston's company immediately afterward left the country, and the Massachusetts tribe were so demoralized by this sudden assassination that they dared not stay in one place long enough to plant corn, but kept moving to and fro, not able to find a messenger willing to go and sue for peace

SWORD OF MYLES STANDISH, OF ANCIENT PERSIAN MANUFACTURE. [IN PILGRIM HALL.]

ELDER BREWSTER'S CHAIR [IN PILGRIM HALL, PLYMOUTH, MASS.]

among the English, whom they had now named in their tongue "The Stabbers."

For the rest, the pilgrims got on well with the savages from this time until the Pequot war, and drove a thriving trade for beaver-skins up and down the coast, establishing posts at length as far to the eastward as the Kennebec, and as far westward as the Connecticut River. So eager did they find the Indians for their trinkets, that to obtain them the women would sometimes strip off and sell the beaver coats that covered them, fastening boughs of trees about their bodies for modesty's sake.

While the Pilgrims did not at any time starve outright, as did the Jamestown people, they were plagued with almost continual scarcity and fear of famine during their first three years at Plymouth. They escaped starvation now by a good catch of fish, again by the abundance of water-fowl; sometimes they rejoiced in corn bought of the Indians, and once famine was staved off by the kind intervention of some fishing-captains on the eastern coast, who made a general contribution sufficient to give a quarter of a pound of bread to each person daily, until the green corn should be ready, some months later. The scarcity came at first from their inexperience in raising maize, their enfeebled health, and the necessity for fortifying; the famine was prolonged by the arrival of fifty lusty young colonists from England, with good appetites, and no provision, and almost without clothes; and later the green corn was stolen by the lawless wretches brought over to plant Weston's miserable and short-lived

colony at Weymouth. At one time Plymouth had neither bread nor corn for four months together. Having but one boat left, the men were divided into companies, six or seven going at a time with a net to fish. These never returned empty-handed, for there was nothing for them at home. It was sometimes necessary to stay out five or six days, in which case those at home would leave their cornfields and go to digging clams. One or two ranged the woods for deer, of which they now and then got one, dividing it among all. In the winter, besides water-fowl, they had also the little ground-nuts which the Indians ate.

In all this scarcity they were cheerful, and the few who were delicately bred bore hardships with the rest. Elder Brewster, whom we have seen acquainted with the great world at Elizabeth's court in his youth, ruled the church, as Bradford governed the State, but he took his turn with the rest in standing guard. "His bible and his sword were alike familiar." When he had nothing to set before his family but the tiresome shell-fish, without bread, or any other food, he would devoutly give thanks over these breakfasts, dinners and suppers of clams and cold water, that they were "permitted to suck of the abundance of the seas, and of the treasure hid in the sand."

In the summer of 1623, the colonists having planted corn each for himself, there was prospect of a good crop; but they were still living on sea-food, without bread or beverage, when the ship *Anne* arrived with a company of immigrants. Those who had come to them before were all from England, but this vessel brought also some of their old friends from Leyden. The new-comers were dismayed when they beheld the tattered and even half-naked state of some of the Plymouth people, and saw their sunburnt and weather-beaten faces, their bodies meager and in some cases swollen from a diet of animal food only. Some bewailed the fate that had brought them to such a country, and wished themselves in England once more; some "fell a-weeping, fancying their own misery in what they now saw in others"; some broke out in pity for the distress their friends had endured for three years; but others rejoiced to see those from whom they had been so long separated, and were hopeful of better days now they were together. Among the new-comers were wives and children of some of the first colonists, who now had nothing better to feast their newly arrived friends with than "a lobster, a piece of fish without bread or anything else but a cup of fair spring water." It is the governor, Bradford, who writes thus

feelingly, and among the newly arrived was the lady whom he was to marry and whom he now probably welcomed by a breadless dinner of lobster and water.

In the spring of 1624, the pernicious system of communistic farming, which had been forced upon them by their arrangement with the London merchants, was wholly done away with, and permanent allotments were made of small parcels of land, lying in a compact body for safety's sake. As at Jamestown, so here, the disappearance of want was simultaneous with the establishment of individual interest. Though the colony, deserted by the disappointed mercantile company in England, had to buy goods in 1625, for their Indian trade, at an interest of forty-five per cent., and had to borrow a thousand pounds in the following year at thirty per cent., the energy and financial skill of the leaders brought them honorably out of all their money troubles. Some of the chief men, Bradford in particular, afterward acquired competence by trading in furs on private account.

In 1626, an ambassador from New Amsterdam visited the English at New Plymouth, as the place was then called. He has left us a very fair description of the outward appearance of the little plantation. There was a broad street "about a cannon-shot of eight hundred yards long, leading down the hill with a rivulet." The houses were constructed of hewn planks, and neat gardens were about each house. The whole was surrounded by a stockade, in which there were three gates. The governor's house stood at the crossing of the streets in the middle of the town, and in front of this was a square inclosure, on which four guns were mounted, so as to sweep the streets in all four directions. On the hill, now known as "Burial Hill," was a large square house of thick sawed plank on a frame of oak-beams. The flat roof of this building held six four or five pounders, which commanded the country about. The lower part of this rude fort was the church of the militant Puritans. At beat of drum, on Sunday morning, the men came to the captain's door, with "their cloaks on," and each bearing a musket or matchlock. Three abreast they walked to church, led by a sergeant. In the rear came the governor, in a long robe; on his right, wearing a cloak, Elder Brewster, who acted as preacher; on the governor's left, Captain Myles Standish, who also wore a cloak and side-arms, and carried a small cane as a sort of baton of authority, perhaps; "and so they march in good order, and each sets his arms down near him." Thus they were "constantly on

their guard night and day," worshipping with loaded fire-arms, and with six cannons on the meeting-house roof.

## IV.

## THE PURITANS IN MASSACHUSETTS BAY.

THE settlement at Plymouth brought a new force into English planting in America. The hope of immediate commercial profit from colonies had proved illusive. It was, besides, a motive of slight persistency for so difficult a task as the transplanting of the home-loving Englishman of that time into a savage and almost unknown land. "We English are known to the world as loving the smoke of our own chimneys so well, that hopes of great advantages are not likely to draw many of us from home," said John White, of Dorchester, in 1630. Captain John Smith, who boasted that he was not so foolish as to believe that any man would ever plant a colony for anything but pecuniary profit, lived long enough to admire the fortitude and courage, while he laughed at the "humorous ignorances," of "about a hundred Brownists," who had planted where he had tried in vain to persuade merchants to make a beginning. Once the religious motive was introduced, it became a most powerful factor in peopling the American wilds. Puritans, Huguenots, Salzburgers, Anabaptists, Moravians, Presbyterians, followed in the path to religious freedom opened by the example of the "hundred Brownists," whose sufferings for scrupulosity's sake seemed ridiculous enough to men of worldly sagacity like Smith. When the pilgrims had set their feet firmly on the coast of New England, they became "stepping-stones to others," as they had foreseen,—and not to religionists alone, but to traders and fishermen. The savages were put in awe by the prowess of Standish, and their confidence was won by the just and kindly dealing of Bradford and the diplomacy of Winslow. Other comers might now inhabit the coast. Fish-drying and fur-buying settlements began to appear as early as 1622 and 1623, on the banks of the Piscataqua and the coast to the eastward. These were germs of Maine and New Hampshire, the only lands on the New England coast that were settled at first from other than religious motives.

The intrepid little colony at Plymouth by 1624 had come to number a hundred and eighty persons, and its fame had been spread abroad in England in the writings of Captain John Smith and in the published journal of its leaders. At the same time the fisheries and the fur-trade were rising in importance; forty vessels went a-fishing on the New Eng-

GOV. JOHN ENDECOTT, FROM A PAINTING BY SMIBERT AFTER AN OLD DRAWING FROM LIFE. [BY PERMISSION OF THE MASSACHUSETTS HISTORICAL SOCIETY.]

land coast in 1623. Some men of Dorchester made an attempt to unite fishing with colonization the next year. A colony was set down on Cape Ann, which should grow maize for provisioning the fishing-vessels, and in the season of fish lend a hand on the ships, and thus save the carrying of double crews. But it was a case of seeking red-herrings in the wood, and strawberries in the sea, for farmers were but lubbers when it came to cod-fishing, and seamen were equally clumsy in growing Indian-corn. But when the unprofitable colony broke up, Roger Conant, its governor, who had been a Plymouth settler, removed with two or three others to Naumkeag, where Salem now stands, and waited for a new colony to come to them from England.

Besides these settlers at Salem, there came isolated pioneers to other parts of the region afterward covered by the Massachusetts charter,—men who had come no one knows how or when, but who, curiously enough, were of the several types so generally represented on the border-line between savage and civil life. On an island in Boston Harbor was the solitary and adventurous Scotchman, whose like can be found in almost every out-of-the-way place in the wide world. The first settler of the peninsula on which Boston stands was, appropriately enough, a scholarly recluse, a clergyman by the name of Blackstone or Blaxton. True to

the instincts of his class as we find it on the frontier at the present time, Blaxton departed farther into the wilderness when new neighbors came. He said to the Puritans: "I came from England because I did not like the lord-bishops, but I cannot join with you lest I should be under the lord-brethren." The libertine and rollicking scoffer, always found in such a refuge from authority, had more than one representative, but the chief was old Thomas Morton, who got possession of a fortified house in what is now Braintree, which he called Merrymount. Here he welcomed renegade bond-servants, and sold fire-arms to the Indians. He broke the commandments with delight, consumed a great deal of "strong waters," wrote licentious songs, devised May-dances, in which he taught the saturnine Indian women to participate, and laughed at the prim and pious brethren of Plymouth and Salem in the ribald verse of a coarse and clever college man.

After the coming of Endecott, this devil in the Massachusetts paradise was, with the general consent of all the occupants of the coast, captured by Myles Standish, and sent to England, while Endecott, a sturdy fighter of imaginary Apollyons, marched to Merrymount, and, in God's name, solemnly chopped down the "idol,"—as a May-pole was called in Puritan parlance,—and ordained that the place should no longer be called Merrymount, but Mount Dagon, in memory of the Philistine image that fell down before the ark. Even sober-minded people of our time may join in the laugh of the reprobate Morton at a zeal so much of the color of Don Quixote's chivalry. One other primitive and isolated settler at "The Bay" will be recognized as belonging to a class of pioneers common in many western wilds. This was Samuel Maverick, who established himself very early on Noddle's Island, where now is East Boston. One traveler in New England declared that Maverick was the only hospitable man in the colony. The preservation of rigid Puritan habits of worship, fasts, and a becomingly irksome method of Sabbath-keeping was not consistent with the indiscriminate entertainment of strangers. But Maverick, whose house was open to all comers, was no Puritan, and seems to have bothered himself little about any of the anise and cummin of

JOHN WINTHROP, GOVERNOR OF MASSACHUSETTS BAY. [FROM AN ORIGINAL PAINTING IN THE MASSACHUSETTS SENATE CHAMBER.]

The people who settled Massachusetts Bay were not Separatists like the followers of Robinson who had planted Plymouth. Agreeing with the Separatists in the severe Calvinism of their theologic system, and in the unrelenting austerity of their moral code, they yet refused to follow them into independency. Persecutions, fines, prisons, and the fires of martyrdom had failed to drive them from the National Church. They hated "the popish ceremonies" of the prayer-book, the surplice of the minister, the communion of the wicked, and the lordly domination of the bishops. But they proposed to deliver the Church from her oppressors and to winnow the chaff from the wheat; and woe to the chaff which they should cast into the fire! Yet this hope of seeing a church without spot or wrinkle, prayer-book or bishop, died under the reactionary tyranny of the Stuart kings, and many came to look with favor on a project, whose full import was only whispered in the ear, to found in the wilds of America

religion. Yet, when the Indians perished by whole villages from small-pox, he was foremost in caring for those who had been deserted of their own kindred, and in burying their dead.

"a particular church" as they phrased it,—a new church with the right of priority and backed by state sanction.

In describing the contact of these "old planters," as they were called, with the new authority of the colony, we have anticipated the Puritan settlement of Massachusetts Bay, which began in 1628. The Puritan party in the Church of England was by this time smarting under the persecutions which sprang from the growing influence of Laud, "the Father of New England," as a colonial historian wittily calls him. As the cloud over the heads of the non-conforming clergy and their people grew blacker, the petty free state of New Plymouth, settled by a persecuted people on the margin of a continent all but boundless, shone like a distant pharos in their eyes, inviting them to plant a Puritan church in a new state, which should embody their biblical ideals.

In its outward seeming the company that proposed to colonize Massachusetts was a commercial corporation. It professed a desire for the conversion of the heathen, but so also did all others who received grants and charters. Religion was used for decorative effect in the mercantile undertakings of that day; the very bills of lading were devout, and it was common enough to exchange rum and glass-beads for beaver-skins under color of promoting Christianity. The most serious deliberations of the new company were secret, and some of the horseback journeys for consultation were made in the night.

John White, a clergyman of Dorchester, advocated this migration as Hakluyt had that to Jamestown. But White's writings belong to a new epoch from those of Hakluyt. The romantic age of Elizabeth had utterly passed away; we no longer read of golden ornaments and strings of pearl, and of commerce with rich Cathay; it is now only a matter of homely corn-fields, cod-fisheries, and the beaver trade.

In 1628, John Endecott, at the head of less than a hundred people, was sent over to Salem, where Roger Conant, of the old Cape Anne colony, was holding the ground. The next year an excellent minister, Francis Higginson, came with about three hundred, mostly servants of the company and of individuals, and bringing a supply of "rother beasts," or neat cattle, and some horses. Higginson, who had been dyspeptic, recovered his health for a time under the influence of a new climate, novel scenes, and active life. He wrote and sent to England a rather imprudent tract, praising New England, as enthusiastic new-comers have ever been wont to praise a new home. A

country in which one could live in health on a simple diet and without beer was a marvelous land to the Englishman of that time, and its advantages were set forth strongly; a lad of twelve could grow more Indian-corn than was necessary for his sustenance, said the good clergyman. This letter had much to do with raising the great migration in the following year.

The leaders of this movement had shown great cleverness in planting a new church without exciting premature suspicions. They presently began to debate a master-stroke of policy. Their charter was not very different from that under which Virginia was so long and so badly governed from London—the charter of a trading and colonizing company, having the right to govern the territory covered by their monopoly without regard to the liberties of the settlers. Those whom the company made “freemen,” or members of the corporation, elected the officers, who made laws for the distant colony. But, either by accident or by some clever foresight and management, no place had been specified for the holding of the “courts” or meetings of the company. These might assemble in London, Dorchester, or elsewhere. A far-reaching plan was now broached to take advantage of this vagueness, by carrying the

charter, governor, courts, and all the machinery of the company, to Massachusetts Bay, where, by electing settlers to franchises and offices, a non-resident commercial autocracy would be changed into a system of local popular government. A paper of “General Considerations,” on the subject, was drawn up and circulated in manuscript among the leaders of the Puritan, or popular party, urging among other things that “The Church hath no place left to flie into but the wilderness.” At a private conference of some gentlemen of birth and culture, held in Cambridge less than six months after the issue of the charter, they signed a paper pledging themselves one to another to migrate to Massachusetts Bay, if the government of the company should be transferred to America. Accordingly, in 1630 a fleet of fourteen sail set forth, carrying eight hundred and forty persons of all ages and conditions of life. These colonists were under the leadership of John Winthrop, a wise and modest man, who had been chosen governor, and who carried with him the patent for their lands, and the king’s charter to the corporation. The adroit use of this charter was the first Yankee trick; by it local and constitutional self-government was founded in the mother colony of New England under the broad seal of Charles I.

MANSSION BUILT AT MEDFORD, MASS., IN 1634, FOR GOVERNOR CRADOCK OF THE MASSACHUSETTS COMPANY.

## THE LED-HORSE CLAIM.\*

A ROMANCE OF THE SILVER MINES.

BY MARY HALLOCK FOOTE,

Author of "Friend Barton's Concern," "A Story of the Dry Season," etc.

### CHAPTER VIII.

#### THE SHOSHONE KITCHEN.

CECIL's life at the mine was a lonely one. Even the ladies who lived in the populous parts of the camp struggled vainly to fulfill duly that important feminine rite, the exchange of calls. There were difficulties of roads and of weather, and of finding the missing houses of acquaintances, which, in the progressive state of the city topography, had been unexpectedly shunted off into other streets. A new street had barely time to be named and numbered before it was moved backward or forward, or obliterated altogether, in the intermittent attempts of the city government to reconcile United States patents with "jumpers'" claims.

Cecil, two miles from the post-office, at an isolated mine, was out of the reach of all but the most persevering efforts of her new friends. In truth, there were not many of them. Cecil was a shy girl, just out of school, with a habit of showing surprise at a great many things that were taken as a matter of course in the camp. Hilgard had one consolation in his exile from all chance of her favor: there was no one else who could boast of it.

The kitchen and parlor at the Shoshone were separated from each other only by a short flight of steps, and a square, dark passage, which opened also into Conrath's office. Mistress and maid, living so near together, and being of nearly the same age, did not pretend to a very formal relation. The sounds from the kitchen plainly described to Cecil, in the parlor, the nature of Molly's operations. When they were loud and urgent; when Molly took the field with her canvas apron girt round her hips, and her wash-tubs in solid array; when armfuls of wood thundered into the wood-bin, or crockery rattled, or resonant tins responded to her vigorous touch, the young mistress kept within her own precincts; but when footsteps trod peacefully to and fro between the stove and the ironing-table, and the clap of the iron sounded at intervals, or when apples bumped comfortably from the pan on Molly's knees to the one on the floor beside her, Cecil ventured out, with her sewing, or

sat idle on the steps, nursing her arms in her lap, and watching Molly's monotonous movements with the pleased, curious content of a child.

These visits had increased somewhat in frequency since Miss Conrath's discovery that the affections of her maid were temporarily deposited in the Led-Horse.

Molly had silently noted this fact, and hinted it to her brother, and to a tall young timber-man who crossed the gulch with him occasionally, and spent an evening in the Shoshone kitchen. The young timber-man had been one of the two men at the cranks, who had hoisted Hilgard to the surface on the morning of his first meeting with Miss Conrath. He recalled this incident for Molly's benefit, who gave it its full value, and beamed over it with the broadest satisfaction.

"Sure I could see a good way out of it," was her hearty if somewhat premature suggestion. "Let them consolidate the mines an' put Mr. Hilgard over 'em both, an' let her choose which side of the gulch she'd live on."

On the days after these evening visits, Molly was unusually communicative, and had a great deal of information to give on the progress of the dispute between the mines. Cecil did not always restrain her when she sometimes inadvertently passed from an attitude of respectful neutrality to one of undisguised enthusiasm for the side of the Led-Horse. It was best to hear both sides, Cecil said to herself; but she heard very little on the side of the Shoshone in these days.

It was becoming more and more difficult to talk to her brother of his affairs, and to ask for his confidence. He seemed unusually preoccupied. He often came in late, having dined down town, and breakfasted alone in the long parlor at ten or eleven o'clock. Cecil, taking her morning walk on the windy porch, would run in for a moment to pour his coffee, perching opposite him with her hat on, and the wings of her cloak thrown back from her pretty arms. She would carry his cup round the table to him, bestowing the kiss of custom on his pale, unshaven cheek. He received it generally with fraternal indifference, but some-

\* Copyright, 1882, by Mary Hallock Foote. All rights reserved.

"BETWEEN DAYLIGHT AND DARK." [SEE PAGE 371.]

times he would pull her down on the broad arm of his chair, pinch her small chin, and tell her, with careless hyperbole, that she was the prettiest girl west of the Mississippi! And she would scold him for drinking such very black coffee in such a large cup.

"Look at your hand, how it shakes, you stupid boy. A man never knows how to take care of his health, and you wont let me take care of yours for you."

"Take care of your own, Cecy," he would say. "You were always the best of the whole lot of us."

Once she reminded him of an old promise to ride with her every day in the valley, and read aloud to her in the evenings.

"If we don't begin soon," she complained, "the valley will be covered with snow. I haven't had my habit on for six weeks, and I've read everything in the house, through and through, alone here by myself all day long."

"Poor little Cecy! it is a dull cage for such a pretty bird!" Conrath would reply. "Never mind; when Shoshone stock is up to thirty, we'll have some good horses, and we'll go east every winter and have our friends out here in summer,—and a dinner party twice a week. You could go back at any time, you know, if you're getting tired of it."

"You know I don't want to go back, or to have dinner parties, or anything like that. I only wish you would treat me more—more as if I could be trusted to know about things."

"About what things, for instance?"

"About your troubles with the Led-Horse. Have they blasted through?"

"No, they haven't yet. You've never forgotten that barricade, Cecy. Now, you see how impossible it would be to tell you things, as you say. The simplest thing would seem to you quite frightful. Girls ought not to know what is going on in a place like this."

That's one reason why I am not so much troubled about your loneliness. It's better for you not to hear all the gossip of the camp,—it would make you unhappy."

This was the most intimate conversation they had had for weeks. A few days afterward, Molly informed her mistress that the Led-Horse had blasted through on a level with the Shoshone barricade. Cecil gave a gasp at this news. Molly, however, assured her that everything was peaceable. The Led-Horse had no guard and no barricade, except the loose rock that had fallen with the last blast; but its lawyers had gone down to the session of the district court at D—with important testimony, and by this time the injunction was virtually granted. That was probably the reason why Conrath had turned so silent, and was busier than ever, Cecil thought. She still persisted in the belief that Gashwiler was responsible and that her brother had been deceived up to the point of a distressing awakening from his costly delusion.

It was nearly the middle of September. The season was over, when daily the dry winds whirled across the porch, shook the loose sash and, flinging a cloud of yellow dust against the pane, carried their rude message from house to house of the little settlement, and on along the white road to the camp. The season of rains was over, when daily the cold showers hurtled on the roof, and blotted out the valley; when wild flowers blossomed on the pass, and lined the cañons, with a phantasmal beauty. The late, passionless summer had come to the tempestuous year, just as summer elsewhere was taking her leave. Was this a place for men, Cecil murmured to herself in her lonely walks, where even the grass, that commonest vegetable joy, gave up the ghost and withered in the autumn, as sparse and feeble as in the earliest spring!

The day after the news of the injunction, Cecil resolved once more to approach her brother on the subject of his troubles. She lay in the hammock, which was stretched across the long room, her slippered feet to the fire, the light from the low window shining on the top of her cushioned head, listening for the clink of a horse's hoof, on the frozen ground. She listened and waited, until sunset faded into twilight and lamps were lit. Dinner was indefinitely postponed, and Cecil took a slight meal and a lonely cup of tea by the fire. With a book in one hand she read, and sipped her tea and listened, alternately. She heard the outer door of the kitchen shut; silence followed—absolute silence all over the house.

It was very strange of Molly to have gone out without permission at that hour, leaving

her mistress alone in the house. When the girl came in, fully two hours afterward, Cecil took no notice of her, not venturing to speak while she felt hurt and vexed. Molly, however, was too much excited to wait upon her mistress's mood. Her hair was disordered, and her cheeks were flushed and shining with wind-dried tears. She came straight to the fire, kneeling on the rug and asking, in a loud whisper,—

"Is Mr. Conrath home yet?"

"You know that he is not," Cecil replied without looking up from her book.

"There's something I must tell you, Miss Cecil, if I was to leave the house to-night!"

"You seem to have done that, already, Molly, without regard to me."

Then, as Molly turned her face away and put her apron to her eyes, Cecil abandoned her attempt at dignity and leaned toward the girl impulsively.

"Why, Molly, what is it?" she said, putting her hands on her shoulders and pulling her toward her. "What are you crying about?"

Molly put down her apron.

"You've a right to know it, Miss," she sobbed, "if it is your own brother; and Tom isn't one to meddle except to save trouble. Mr. Conrath, maybe, would kill me for speakin'. Gashwiler would, any way!"

"Don't run on so, Molly! Wait a minute and tell me quietly; and don't tell me anything but the truth."

"It's Mrs. Gashwiler, Miss, that it comes from, and I'd believe every word, for she's an honest woman, though as hard as a nail—and what would it be to her interest? She's got the same grudge as her man has against Mr. West and Mr. Hilgard. It's little she'd care, if it wasn't for Tom."

Cecil sat helpless under the confusion of Molly's words, feeling, in her suspense, that they were fraught only with misery.

"Tom was always good to her young ones when he boarded with 'em. He was packin' the little lame one about whenever he got the chance, and she's never forgot it of him. She heard somethin' one night between her man and Mr. Conrath. She was wakin' with the tooth-ache, and the walls is nothin' but lath. She wouldn't tell Tom what it was, but she got at him to leave the Led-Horse, for fear he'd get into trouble along with it. And she made him promise he'd never tell on her. And he's kep' it till he says it hangs on him that heavy that he's bound to speak. But it's to you he bid me come with it. He'll not go to one o' his own side, but, says he, 'Mrs. Gash can't complain of me for speaking to Mr. Conrath's own sister; for she's a Sho-

shone, and whose got a better right to know what diviltry he's up to."

"Mr. Conrath, Molly—my brother?"

"Mr. Conrath's in it, not a doubt o' that; an' it means trouble to the Led-Horse, or Gash's wife would never be after Tom to try to get him out of it. An' he won't stir for me, Miss! He'll stick by his own side." Here Molly's sobs broke forth. "For God's sake, Miss Cecil, you'll not go to Mr. Conrath with it!"

"Molly, whom am I to go to?" Cecil's lips were white and her voice had sunk almost to a whisper.

"Go to Mr. Hilgard, Miss! Tell him to look out for himself an' for them that's under him, an' to put more than a heap o' rocks between him an' Gashwiler's barricade. What good'll his lawyers do him, when they've jumped him. That's what Tom says, Miss," Molly went on, in her loud, vehement whisper. "He says they're gone, if the law takes holt; they'll have to pay back every dollar's worth of ore they robbed Mr. Hilgard of, an' it'll ruin them," cried the girl, reckless that she was speaking to a Shoshone. "And they're waiting for a chance to jump the mine. 'They'll clean her out,' says Tom, 'before ever the law'll give it back.'"

"Molly, do you ask me to go to a stranger to warn him against my brother? You must be crazy. I cannot go to any one but my brother. I shall tell him nothing that you have told me. I am not going to betray *your* brother. I will ask him—oh, I will make him give it all up, and let us leave this place!"

"He'll never do it, Miss! no more than Tom'll leave the Led-Horse for me askin' him."

"Molly, please go away, and let me think about it by myself. You are a good girl to come to me; you can trust me. If I cannot do any good, I will not do any harm. I must see my brother to-night. If it is no use, then we will think of some other way."

The two girls clung to each other with tears running down their cheeks.

"You'd be speakin' for them all, Miss, if you went to Mr. Hilgard. Sure whatever hinders a fight is for one the same as another."

"How could it hinder anything if I went to Mr. Hilgard?"

"If he'd stop his lawin' an' put five good men in the drift, wid a barricade in front of 'em, Gash'd never touch him! That's what Tom says."

"Do you suppose, you poor child, that Tom knows better than Mr. Hilgard?"

"He does, Miss, when Mr. Hilgard don't know what I'm after tellin' you!"

It was late that night when Conrath returned. Cecil sprang up quickly, her heart beating hard and fast, when she heard his horse's hoofs on the wooden bridge leading to the stable. From the sounds, Conrath was having some difficulty in forcing his horse over the narrow passage. There were signs of obstinacy and nervousness on the part of the horse, and of temper on that of the rider. As the plunging and backing continued, Cecil became alarmed. She ran to Molly's door and woke her, asking for Peter, the stable man.

"Why doesn't he go to Mr. Conrath," she demanded. "He can't get Andy over the bridge."

Molly did not know where Peter was, and Cecil, hearing Andy suddenly clatter across the disputed ground and stop at the stable, went back herself, shivering, to the parlor.

Conrath was a long time getting into the house. He climbed up the end of the piazza, apparently with a good deal of trouble, bumping his knees and elbows on the piazza floor, in his progress.

"Why doesn't he come around to the steps?" Cecil wondered. "It must be very dark."

She opened the door; it was not at all dark. The moon had risen, and Conrath's shadow was thrown up against the side of the house, as he came along the piazza, walking with a heavy, careful step. He passed her at the door, neither noticing nor speaking to her, and, crossing the room, sank into a seat by the fire, without removing his hat.

He slouched in his chair, in a helpless, disorganized attitude, moving his eyes vacantly from her face to his own hands, that hung feebly in his lap.

She knelt before him, without touching him. She looked long in her brother's face, studying, with intense, heart-broken scrutiny, the familiar features, which some mysterious, sickening transformation had made the features of a stranger. The change was very slight. Mrs. Denny would have understood it instantly. Many of Conrath's friends would have been amused by it. Gradually the meaning of it came to Conrath's sister, but it did not amuse her. She recoiled from him slowly, rising to her feet, a cold, incredulous disgust whitening her cheeks and her lips. It was too cruel a mockery of her reliance on him. She went away to her room and hid herself from the sight of him, leaving him to sleep off the effects of his "predilection" by the fire.

Cecil did not sleep; she lay in the darkness hour after hour, shuddering, with dry convulsive sobs. The trouble she had looked in the face that night she knew was a

wretchedly common one, but she had never believed that it could touch her own life. She reproached herself for deserting the shabby figure in the chair before the fire, but to-night she could not feel that it was her brother. If *that* were her brother, where then could she look for help!

She made no effort to see Conrath the next day; in fact she kept out of the way of seeing him until he had left the house. At noon, she went to Molly with a note and asked her to see that Mr. Hilgard received it promptly.

"You must give it to him yourself, Molly, or to Mr. West."

"Thank you, Miss Cecil," said Molly, taking the note.

"It may not do any good," the girl said wearily, "and I am not doing it for you any more than for myself."

"Did you sleep any the night, Miss?"

"Why should I sleep? Did you sleep yourself, Molly?"

"I did, Miss. But the heart of me was wakin' and dreamin'. I dreamt Mr. Conrath was a draggin' you over the bridge, an' him on Andy; an' you was pullin' back, but he had you by the hand an' wouldn't let go."

"It is easy to see how you came to dream that, Molly," said Cecil, a slow, painful blush burning itself upon her cheek. "Do you remember my knocking at your door?"

"Did you, Miss? Last night, was it?"

"Yes, it was last night; and it was Andy, not I, who wouldn't go over the bridge. My brother would not have to drag me, if he wanted me to follow him anywhere."

Cecil kept by herself all day. She could not bear even Molly's eyes upon her, while she was learning to bear the first pressure of the new and ignominious grief, which she had put on like a garment of penitence under the soft robes of her girlhood.

## IX.

## BETWEEN DAYLIGHT AND DARK.

THE sun was just below the Shoshone hill. The black, denuded pines on the hill-top leaned toward each other, or stood erect against the yellow light that streamed upward and broadened outward, through a thin, gray cloud that overspread the western sky.

Cecil was hurrying down the unused trail, to meet Hilgard at the blazed trees. She felt they would be safe there from interruption. Her heart was too heavy to flutter with girlish doubts and tremors. She sped along, beating

back with her rapid footsteps the folds of her somber cloth dress.

Hilgard was waiting for her, walking about impatiently, one hand in the side pocket of his closely buttoned pea-jacket, the other holding the cigarette he was mechanically smoking. She had kept him waiting three-quarters of an hour; he was feeling half angry and cheated, and altogether disappointed, when he saw her coming, among the gray-stemmed aspens, that were dropping all their pale gold leaves in the grasp of the autumn winds. He started toward her at once, forgetting his grievance at the first sight of her face. She let him take her hands and look at her, feeding his hungry dreams of her in absence with the sweetness of the reality. She explained hurriedly that some ladies from the camp had called and detained her.

"You know it is only trouble that brings me here."

He restrained some passionate exclamation, and said, as humbly and quietly as he could,

"I knew, of course, it was not for your own pleasure or mine."

"And you must have known it was the old trouble—between the mines," she went on, without heeding his words. "I have thought of a way that might make things less—less unhappy." She hesitated, and he waited for her to explain.

"I have been told that you are likely to get the injunction against my—against the Shoshone; there will be claims for damages against us which may be hard to settle——"

"Against *you*—great Heavens! They are not my claims and they are not against your brother. Can't you make it more impersonal?"

"I am afraid I cannot," she said, gently; "our side has been in the wrong. I believe that now. It is right that you should triumph."

"Why will you call it my triumph? If you could have the faintest idea what I'm paying for it!"

"It is your triumph, and you will be associated with it if you stay to see it finished. And the failure and disgrace will be associated with—my brother. Wait a moment, please——" She put her hand up to the black scarf that swathed her throat, as if to still the "climbing sorrow" there. "I have not come to apologize for my brother, but—I—I believe he has been deceived! He has had bad counsel. This is the first—first——"

She could not go on, and Hilgard bowed his head before her.

"I am sure he has," she began again, in her voice of stifled misery. "And this person

who, I think has betrayed him, is an enemy of yours. I am sure of that too. He is a man with an old grudge against you, and against your mine. No one can tell how much this may have been with him in his influence over my brother. He might never have shown it. Don't you see how it might embitter a dispute like this, and make it personal? And how much harder it would make the settlement? The triumph of your side would be very hard for your enemy to bear. You would be hated."

"These old grudges are not so dangerous as you think; men hold them till they get used to them, and take a certain satisfaction in them. I think I know the man you speak of, but there are a great many men in the camp with grudges against me. One expects that in a place of this kind."

"You don't see what I mean," she said, with a despairing sigh. "I want you to remove part of the cause of this trouble, before the time for the final settlement comes."

"You want me to remove myself?" he asked.

"Yes, I want you to go away and let some one else come to do that part. Then it will be only between the mines."

"You ask me to resign?"

"Yes, I do," she repeated, with sad persistence.

The words struck to the very core of his weakness. He had himself pondered the joyless situation and counted the cost of its issues. The injunction was certain to be granted, and the suit for damages could but develop either inefficiency on Conrath's part, or a deliberately dishonorable policy. If that policy had been successful, it was not likely that any questions would have been asked at the Shoshone home office; but unsuccessful rascality was not likely to find favor even with Conrath's "company." The triumph of the Led-Horse would be complete. The arrears of its expenses could be paid out of the Shoshone ore-bins. Hilgard's own infatuated tenacity, as it had probably seemed to his president, would be justified,—and then? He would go on living on his barren hill, with his hidden loss and defeat burdening his spirit. The triumph would still be Conrath's, through his sister. But if now, at this point in the contest, with the cause of the Led-Horse safe in the hands of the law, he might step out and escape the odium of success!

She stood by the blazed pine, pressing her ungloved hands hard against its corrugated trunk, and looking at him with an imploring suspense in her eyes. It was more than youth and passion could bear.

"Cecil," he said, trying to steady his low accents, as he spoke her name for the first time. "There is only one reason why I should do this. I have no real enemies except those who keep me from you. If you will ask me to go for your sake, I will go to-night. Do you ask me to go in that way?"

"Oh, I ask it,—I ask it! What does it matter how I ask it? What does anything matter?"

"But it matters all the world to me! I am not doing this for fear of any man's hatred, but for love of you. I have no business to go—my place is here until everything is settled. But if a scruple is to cost me my life's happiness,—it is too much to pay. Shall I go for you, my love?"

"Do I ask you too much? Is it a sacrifice of your honor?"

Her eyes still pleaded, although she forced herself to give him a chance for retreat.

"Don't ask me now. I don't know what honor is. I only know what love is. I will go for you."

He took her hands, with the print of the rugged pine-bark on their tender palms, and held them up to his face and laid them about his neck. They clung there a moment. Her heavy hat fell back, and her fair, unsheltered head drooped against the rough folds of his coat.

"If I should go, how will it be when we meet again? I shall not be on the other side, then?"

"No," she murmured.

"You will come to me, whatever side I am on?"

"Yes."

"I have your promise, Cecil?"

"Yes, unless —"

"No, nothing but your promise!"

Her arms slipped down.

"But a great deal may happen before we meet again —"

"Yes, but when or where, or how we meet, you are mine, dearest, remember!"

"Have I promised that?"

"That, or nothing. Don't play with me, Cecil. Either you mean it, or you don't. I am in dead earnest. There is no reason for my going, except that you ask me,—the girl I love!"

"You must go," she said, pushing him from her. "You are going to-night!"

"To-night! But why to-night?"

"Please, please go! I want you to go to-night. I shall not dare to be happy until you are gone."

"I might go," he said doubtfully, "if there is time?"

"There is plenty of time—you said you

would go to-night. When the train goes out, will you be on it, George?"

She let him kiss her hands and her lips, and draw from her finger a little ring,—a slight, school-girl token; she scarcely knew what he was doing.

"I want something to make it seem true. You have always been such a hopeless dream. Is it true?" he whispered, passionately. "Am I sure of you, darling?"

Not so sure, but that, in a moment, she had slipped out of his arms and was running away in the gathering dusk, that made her figure almost one with the dun hill-side. He had nothing but her ring clasped in his hand. He turned away, trembling and half-stupefied. His foot struck one of the low, gray monument stones, and he staggered forward, saving himself, with a heavy jar, against a tree-trunk. Recovering from the shock, he found it had deprived him of the ring. He searched for it long, stooping and groping about on the rough ground, sifted over with trodden pine-needles. At last, when twilight settled darkly in the hollow of the hills, he gave up his quest and took the homeward path, a pang of bereavement chilling his new-born bliss.

He went to his office, wrote two or three letters and telegrams, and from the drawers and pigeon-holes of his desk, he collected a number of papers and note-books which he placed in a heap on the lid. He then went deliberately around the room, picking up various articles, in preparation for his packing. With all these in one arm, he was about to put out the lamp, when he saw a sealed telegram lying on the floor behind his desk. It might have been blown off when he opened the door. It was with a strange reluctance he put down his burden and opened the telegram. The spirit of the change was upon him. He was impatient to be gone. At D—— he would see his lawyers and leave with them certain directions and papers for the forthcoming trial, write his farewells to his few friends in the camp from there, and start eastward at once. His formal resignation lay on the desk, directed to his president.

The telegram was from Wilkinson. It read: "Thrown out by technicality. Court probably tampered with. Look out for jumpers."

He read the message over two or three times, then folded it and placed it in a note-book which he took from the breast of his coat. He did not take up his armful of properties again, but sat down by the desk, looking fixedly at the sealed letters before him. If temptation had been strong with him in the gulch, it was stronger now that he had yielded the first step; and if his happiness had seemed at stake before, there were possi-

bilities in this new situation which made his heart stand still.

"No, by heaven!" he exclaimed, pushing back his chair. "I've gone far enough. Let them get some one else to do police duty for them!"

Nevertheless, he took up his letter to the president and tossed it into the fire. The other letters and telegrams followed. This was no time for resignations. He would see West at once.

On inquiry, West was not to be seen. He had gone down to the camp. Hilgard went to his room, pulled open his bureau drawers, and began shoving various articles hastily into a traveling-bag. He sat on the side of his bed, with the bag between his knees. When it was packed, he still sat motionless in the same position, rigid with the silent struggle that possessed him.

A knock came at the door of the outer room. It was unlighted, except by the broad glow of the fire. Hilgard opened to West, just returned from the camp.

"Come in, West, I want to see you."

"I want to see *you*, sir."

While Hilgard hunted for Wilkinson's telegram in his pocket-book, West produced a scrap of gray hardware paper, and held it out to his chief.

"Just look at that, sir. I picked it up to-night on the counter at Bolton & Trivet's."

Hilgard stooped and held the paper to the fire-light, while West, turning round, with his lean, chilled brown hands behind him, spread their palms to the warmth.

The paper bore a memorandum made with a broad, soft pencil.

800 Car.

50 Win.

*Shoshone.*

Hilgard produced his telegram and handed it with the paper to West.

"There you are," he said.

"Yes, sir. There's the whole infernal business," West replied, as he studied the telegram. "It shows what they think of us," he added, with a grim smile, "They dassent try it on with less than fifty Winchesters."

"You can't make anything else out of it, West?"

"There aint anything else to make. It's an old game! I've more'n half expected it. I looked round a little, while I was down to the camp," he continued, in his slow, quiet drawl, "and got track o' some boys that I can depend on. Told 'em they'd better come along up soon 's they could. They'll come all fixed. If you don't like it, sir, it wont make a bit o'

difference to them. They can keep their mouths shut."

"It's all right—it's the only way."

Hilgard stepped back and closed the bedroom door on his preparations for departure. West stood with his back to the fire, his eyes fixed on the toe of his extended boot, which he grated back and forth on the bricks of the hearth. He did not lift his eyes as Hilgard came toward him again, but remarked to the toe of his boot,

"Wish *you'd* git out of the camp. To-night aint any too soon. You can trust the Old Horse to me, sir! I'll hold her in spite of hell!" He looked up now, with a keen gleam lighting his blue eyes. "Damn it, *you've* got friends in the East!"

"I have one friend here, it seems," said Hilgard.

The two men looked into each other's faces, silently.

"We'll hold her together, West!—Come, there's no time to talk!"

At twelve o'clock that night, West and Hilgard were hurrying over the frozen ground toward the shaft-house. The old moon had risen with a circle round her imperfect disk. Long, white clouds were banked in the southern sky, and there was a chill foreboding of snow in the air.

"She hasn't shut down," West remarked, looking across the gulch toward the Shoshone.

"Very likely she wont; it's a good blind for us, and she has men enough. They must have noticed that we are all quiet over here."

"I took care of that, sir. I told Tom Ryan to give out, kind o' promisc'us, down to the boardin'-house, that we're in a kind of a scrape over here—pump broke down. He's always jawin' back and forth with 'em."

"West, I wish you hadn't done that," Hilgard said sharply.

West replied with some heat,

"Good Lord! They're five to one—aint that enough? If they want to try it on, let 'em try it to-night!"

There was an ominous stillness in the Led-Horse shaft-house. The low moon looked in through the bare, dusty windows, where a group of men with rifles slanted between their knees, sat around an old cast-iron stove. The engine was silent. The only sounds in the dim place were the steady boring of an auger in the hands of some person unseen, and the fire, leaping and roaring in the stove, which had flushed a sullen red, and emitted sharp lines of light through its cracks. The auger stopped boring as Hilgard and West entered. There was a shoving of gun-stocks and of

heavy boots on the gritty floor, but no one spoke.

Hilgard looked about him at the hasty preparations for defense. The iron plates of the platforms had been taken up and turned on edge against the thin board-walls. Loaded ore-cars, taken from their tracks, barricaded the weakest points. The auger had been boring loop-holes in the sides of the shaft-house, above the line of protection.

"We've got you pretty well fixed, up here, boys, if they should make a rush on top."

"They'll be fools to try it," West remarked aside. "You can't shove a lot of ten dollar fighters against an armed shaft-house!"

"West, send those six men down the ladders. We'll take the bucket," the superintendent ordered.

"I reckoned I could hold the drift alone, with a Winchester," West ventured, in his most indifferent voice. "A Winchester's mighty comprehensive!"

Hilgard's eye was on him, but he carefully avoided it. There was an imperceptible stir of appreciation among the men around the stove.

"Two Winchesters will be more comprehensive than one. The fight will be there!"

"I wish you wouldn't go down, sir," said West, almost shyly.

"That's enough about that, West." Hilgard turned to the men. "Murtagh, take care of the boys up here. Lower us away!"

At the word, Hilgard and West each grasped the rope and stepped, with a quick, concerted movement, to the edge of the bucket; standing so, face to face, firmly balanced, with rifle in one hand and the shuddering rope in the other, the two men dropped out of sight into the black hole. The rope swung in wider circles; it slapped two or three times against the sides of the shaft; the click of the brake sounded.

"They're down," some one said.

The droning auger began boring again. One of the men by the stove drew his gun across his knees, looked critically at the barrel, wiped it with his sleeve, and said,

"Hope they wont come up in the bucket with a coat over 'em."

x.

CONRATH COMES HOME.

A YOUNG girl's mood seldom keeps the balance between joy and pain; it will lean, with all the emotional force of her crescent life, alternately to one extreme or the other. Cecil's brief calendar of years had counted no vigil like that of the night before; it was

but natural there should be a strong recoil from such intolerable pain. She did not feel the reaction until long after her tryst with Hilgard was over. Her timid joy in that contract was not quick to assert itself. It grew with solemn gladness in the quiet hours, and met with its warm, strong current, the bitter waters that had spread in the watches of the night, laying waste her pride of life. Her pride was prostrate still, but love can do much to heal the wounds of youthful pride.

Cecil walked, with noiseless step, back and forth the length of the fire-lit room; her shadow, mounting the low walls to the ceiling, followed her with grotesque exaggerations of her movements. She was alone, but to-night she felt no loneliness. Since she had first seen him she had never permitted herself to think of Hilgard. But now her eyes drooped and blushes burned on her cheeks, rebuking the vision that answered her thoughts too vividly. Something in his image, as it came before her that night, troubled her. Was it his beauty, that seemed fit, rather for a pageant of love, than for love's unseen abnegations? Was it the contrast between Hilgard's knightly integrity and her brother's shabby part in life? She had clothed herself in Conrath's weakness and humiliation, as in a robe of mourning. Would her lover accept her in her weeds? Could her future include both Hilgard and her brother?

The struggle was over in which she had tried to preserve her loyalty to Conrath's cause in the face of a growing conviction that he was in the wrong. She found a certain rest in admitting the truth and falling back on the next lower level of womanly faith, that he had been deceived to the last. Now there would be no more talk of mine and thine. Conrath would go East; he could not desire to stay when this wretched business was over. There, among safer conditions, with old friends around him, he would regain his old life. She could find merciful excuses for him in the past. They had been two motherless children, constantly changed about from one temporary home to another, and from one boarding-school to another, until school days were over. She had known but little of her brother's life in the interval between his school days and the marriage of their father, which had made the brother and sister more dependent on each other. That marriage had not given them a mother; it had only separated them a little more from their father. It was then Conrath had made himself his sister's protector and provider. How proud she had been of his new honors and responsibilities, and how grateful for the home he had brought her to! She stopped, in that terror

of the future and its incompatibility with the past, which chilled her dreams of happiness. How could they ever be reconciled?

At bed-time Peter came in with an armful of heavy green logs for the fire. Cecil went into the kitchen and said good-night to Molly, who was dozing over a novel by the stove; she fastened the doors, wound the clock, and curled herself into the hammock, wrapped in a Navajo blanket. She left the curtains undrawn,—a custom in the camp, that the house might not be dark to a friend outside. She would watch these last hours, until the train went out, and bid her lover a silent, prayerful good-speed.

She swung herself gently to and fro, watching the shadows in the room, chased by the flame-flashes. The hammock swung slower and slower. One arm dropped over its side; the warm, relaxed hand softly unclosed; the long shadow wavering on the carpet rested, and Cecil slept.

The fire flamed and crackled and smoldered down. The sky thickened, and the stars struggled to keep their lookout above the restless lights of the camp. The windows of peaceful, frugal homes were dark, but lights burned still in the house of sickness, in the house of revelry, and in the house of death. Underground, where day and night are interchangeable, the ceaseless labor went on. The night traffic of the camp went on; late footsteps sounded on the resonant board sidewalks. Watchers by lonely prospect-holes renewed their fires.

The moon rose above the hill across the gulch, and looked in through the window, a sinister old moon, leaning with one cheek awry above a ragged pillow of cloud. She knew the strifes and the secrets of the camp. She looked in many uncurtained windows that night, upon many sleepers and many who longed for sleep, and upon many to whom such fair, innocent sleep as Cecil's would never come again. The young girl lay alone in the shadowy room and slept, while the night waned, unconscious of the drear procession of to-morrows that awaited the cold, beckoning finger of daylight. The old moon's eye was upon her, while across the gulch, in another shadowy room, the defenders of the Led-Horse sat, with their rifles across their knees, in a fateful silence.

A log parted and fell and rolled forward on the hearth, filling the room with smoke. Cecil woke and rose up to mend the fire, opening the door to let the smoke escape. She stood a moment looking out. It came to her with a shudder, how in that same low light the night before, she had waited at the door for her brother's heavy step, and she

prayed that he might not come home that way to-night.

At that moment, the eastward-bound train went clanging and rumbling out of the town; its roar was deadened now, in the deep cut, now loud again below the hill, dying gradually on the long grades of the first descent. He was gone. Thank God for that! But what was this unwonted stillness of the night? What sound did she miss from those familiar daily and nightly sounds she had ceased to listen for in their continuousness? She listened now, and her own pulses throbbed, heavy and fast, as it came to her that the pulse of the Shoshone had stopped beating. Its engine was silent, and, from the opposite hill, there came not a sound. Both mines were dumb.

Cecil's first impulse was to waken Molly and send her to the shaft-house for news, but she forbore. "Let her sleep, poor girl," she thought, "it may mean trouble for her as well as for me."

She shrank from going out herself to meet whatever event might be coming. She waited an hour—an hour of hopeless expectation.

It was now three o'clock. The night had changed; fleecy moving clouds pervaded the sky, and the moon, wading through them as through drifted snow, occasionally showed a bright segment of her disk.

She heard footsteps approaching the house, treading slowly over the frozen mud. They paused near the end of the piazza, and low voices of men spoke together. Then a single tread went quickly around the house to the outer kitchen-door.

Cecil rose up, wan as a star at daybreak. The first knock came,—low, repeated with brief pauses, as if the knocker listened for some stir within the house.

The footsteps outside, moved forward toward the steps of the porch,—a horrible, four-footed human tread,—shuffling nearer, heavily mounting the steps, grating across the floor of the porch,—pausing at the door. Something was laid down at the very threshold of that door.

She could not go and open it.

The knocking continued. A man's step passed along the porch and a face looked in at the window,—looked in Cecil's face and started back.

Slowly she dragged herself the length of the long room and felt her way through the dark passage to the kitchen.

The knocking was loud on the outer door. She crept to the door of Molly's room and heard the girl moving, and her low voice speaking from the window to one outside.

"Whist, for God's sake! I'm comin'!"

She clung helplessly to the door, and Molly

opening it, took her in, and half carried her to the bed. She pressed her down into it, and covered her deep under the bedclothes.

"Lie still! Don't stir till I come," she whispered, with her warm cheek laid upon Cecil's.

"Molly, the engines have stopped! I must go myself! It is for me!" Cecil tried to rise in the bed.

"Whatever it is you'll know soon enough! I'll come to you with it, Miss Cecil, dear."

Molly shut the bedroom door behind her, opened the door of the kitchen and spoke with some one outside. Cecil heard her close the door again, and heard the footsteps outside returning around the house to the porch.

Molly went on through the kitchen, carefully closing all the doors behind her, as if the sounds in the house were a pestilent wind from which she would protect her mistress.

Cecil, lying alone in the dark room, benumbed by the keenness of her anguished dread, fell off into a half-unconscious dream of some hovering horror. Suddenly she sprang up. Molly was bending over her. A candle on a stand showed the girl's face plainly. Cecil asked no questions. She rose from the bed, and holding Molly's hand, in silence they found their way back through kitchen and passage to the parlor.

Three miners stood with their backs to the fire. They took off their hats as the women entered, and one of them, a smooth-cheeked young fellow, meeting Cecil's eyes, turned away his own, and rubbed one arm hastily across his face.

That which she had dreaded to see was not there, but one end of the hammock had been unslung; it lay coiled on the floor, and across the place where she had been sleeping, footsteps, crowding upon each other, had printed themselves on the carpet in the yellow mud of the mine, making a diagonal track from the outer door to the door of her brother's bed-chamber.

Cecil's eyes followed that track; then she lifted them to Molly's face, drawing her breath with a deep, hard gasp.

The faithful girl took her young mistress into her arms and gathered her close, rocking her gently in her strong embrace, and moaning over her like a mother over a child in pain that cannot be relieved.

Gashwiler stepped out from the group of three by the fire, saying in the heavy whisper of a man who has no low tones in his voice:

"Miss, he was dead at the first shot!"

Molly felt a sharp quiver pass over the form locked close in her arms; she darted a fierce glance at Gashwiler, but he went on in his merciless whisper,—

"It was all over, miss, two hours ago. We lost the fight when he was shot!"

"God help them that begun it!" said Molly, her eyes fixed on Gashwiler's face.

Cecil lifted her head.

"Hush! hush! Let me go to him!"

CECIL looked out the next day on a white world. Snow lay deep on the pass; its soft mantle covered the rugged cañons; it whitened the windward side of the pine-trunks and the gray canvas covers of the freight-wagons, bemired in the deeply rutted roads; it lay smooth on the roofs of the town, and deadened the tramping of feet on the board sidewalks; it had obliterated all the devious footprints of the night before,—it had hidden that track from the Shoshone shaft-house to Conrath's door.

Conrath's door no longer. He would go out of it once more, and then the account between the Led-Horse and the Shoshone would be settled. There was no more talk of mine and thine for Conrath, lying straightened on his unused bed. It had come to Cecil in her long watch beside him that this was the only way in which his future could be reconciled to his past. It was better for him to lie so, his rash struggle over, empty-handed, claiming nothing, refuting nothing. Better that silence, that dignity of rest, that look of his boyhood stealing back over the hardened features of his manhood, than a triumphant bringing home of sheaves that had been wrested from a fellow-laborer. She knew the whole wretched story now. Her faith and pride in her brother had fallen, and it rested at last in a solemn acceptance of his wild death, as a better thing than his life was ever likely to have been. He had atoned to the uttermost, with all that a man has to give in restitution for wrong,—a wrong attempted but not accomplished. The account weighed now on the other side. She was humbly thankful that she would never have to know whose hand had turned the scale.

These were the thoughts that sank, cold and still as the snow-flakes falling from the gray sky, into Cecil's bruised heart, smothering the passion of her grief.

The snow fell all day. It clung to the window-sashes, and melted from the logs that were laid upon the fire. The trail that led down into the gulch was buried out of sight. The yellow gold of the aspens would not be seen again until it had been transmuted into sodden leaf-mold. The low monument stones were hidden; the scars on the young trees, bearing the marks of human possession, had been sealed out of sight by the impartial hand which keeps no record of the contracts

of men; and Cecil's little ring, with its graven motto, *Dieu vous garde*, lay deep under the snow.

A few people came from the town that day of storm to offer their help and sympathy to the lonely household. Molly received them all, and spared her mistress the questions and the exclamations.

Toward dusk Hilgard came plowing through the snow to the kitchen door, and asked Molly if he could see her mistress. A fire had been kindled in Conrath's office, and Cecil had spent many hours of the day sitting there alone. Molly told Hilgard to go into the parlor, and went herself to the office to seek her mistress.

Hilgard went into the parlor and found Cecil there.

Among the rumors of the day that had come dimly to her ears was one that the train eastward bound had been blocked by snow in the valley. When she saw Hilgard enter the room, she accepted the fact of his sudden return as the natural result of her longing for him. She had thought he would hear of her sorrow first when he was thousands of miles away; but the merciful snow had checked him, and the news had brought him back. Bad news traveled quickly, and he would lose no time in coming to her. This was the rapid, unreasoning instinct that took the place of surprise at the sight of him.

She went to him, and all her simple, unquestioning need of him spoke in her face as she raised it to his, putting up her arms like a child.

In the full knowledge of what was before him, he took her in his arms and held her close, in a silent, remorseful embrace.

Drawing his head down to hers, with her hands clasped behind his neck, she whispered:

"You are all that I have left."

He did not speak, but gently unclasped her hands and moved a little away from her. Would she ever come to him again and put up her arms to him, owning him as her only earthly refuge?

She did not seem to understand his withdrawing from her. She stood a moment looking at him helplessly, and then sat down in the nearest chair.

"Did you hear of it, and come back? You knew how I would need you."

"No, I did not come back."

She kept her eyes on his face, without listening to his words.

"You must not look so! You must not suffer so for me! You will see how I will bear it! Ah, think how much worse it might have been! If you had not gone——"

"Cecil—oh, my child! I did not go! You must try not to be hard on me. It had come to the clinch—I could not go!"

"You *must* have gone!" she said, rising and confronting him with her white face of dread. "I heard the train go out."

"I was not on it. Will you sit still, Cecil? I will tell you all."

"I do not wish to hear it—I cannot hear it!"

"Do you think I need not tell you? You will let it rest? God bless you, my dearest!"

"No, no!" she moaned. "You will have to tell me!"

He waited until he could speak, and then spoke fast, in hard, unmodulated sentences.

"I went down to hold the drift. We heard them open the door of the barricade, but we could not see their faces. It was dark in the drift. We called to them to stop. There was firing. I don't know who fired first."

"How many were you?"

"We were two!"

"No, no!" she pleaded, wildly. "There *must* have been more than *two*!"

"The others were not down.—Before God, I don't know who did it; it lies between West and me!"

For a moment there was silence.

"Why did *you* go down?"

"West would have gone alone. You cannot ask me why I did not let one of my men take my place?"

"It does not matter," she said.

"No, it does not matter; the responsibility is mine. Cecil, I am the same man you gave your promise to last night. I do not love such work. I went into it, sick at heart. I wish, God knows, I were in his place!"

"I wish you both were. Oh! my heart is broken!"

"But you cannot mean that it's all over between us? Does it make no difference that it was forced upon me? I have to say it: We were on our own ground; their barricade was fifty feet within our lines. A barricade that is only for defense does not have a door in it; and, Cecil, they were five to one!"

"You are talking about my brother," she said.

He turned away with a passionate gesture of despair.

"George, I do love you," she pleaded.

"That means nothing, if I must go." He stood before her in the roused eloquence of his beauty, which seemed to defy denial. "Cecil, I cannot go! We cannot love each other like unhappy ghosts. We cannot stop living. I am willing to go away now—to wait a long time—but you will give me some hope for the future? You will let me write to you, and see you sometimes? I have had no

chance to show my love for you. It isn't fair to set this awful fatality forever between us!"

She looked at him as if asking him to understand without words, which came so hard.

"I am doing nothing," she said. "It is done already. We must keep apart, because that is the only way to bear it."

"Cecil, you cannot mean it! Why, great Heaven! if I were the lowest criminal, there would be some poor fool of a woman to cling to me! You disgrace me for life. I have done what was simply my duty. But I didn't expect you to feel that. I counted on your mercy. I thought you would forgive me—as you forgive your brother—as I forgive him. For, if this is what you mean, Heaven knows, I too have something to forgive!"

"There can be no forgiveness between us," she said, piteously. "I love you—that means everything. It is nothing you have done. Oh, *can't* you understand? If you were old or crippled; if your life were spoiled in some way, I would share it with you. I would go away with you now, if I could suffer with you. But, if we were together, we should not suffer. We would be happy—after awhile."

"Ah, yes!" he moaned, "we would be happy. What have we done that we should not be happy?"

"You will be happy, I hope—but not with me. Not with—his sister!"

"Why don't you say it out? Am I his murderer, that you hold off from me like that?" Her meek but inflexible resistance maddened him. "Cecil, my little girl, you did love me. Do you love me now? And will you not let me try to heal the hurt I have given you?"

"I love you," she said, resisting his embrace, "but not in that way!"

"There is no other way!"

"Is there not? If it had been you, instead of him——"

"If it had"—he wrested the words from her—"and if he were in my place, now, would you cast him off, for my sake?"

"I could not do that; I could not break a tie that is in my blood."

"Is there no tie, then, between us?"

She leaned her head low between her hands.

"We made it ourselves. I made it, selfishly. I made you come to me; do you remember?"

Did he remember! Only last night her head had rested on his breast; now there was no help or shelter of his she would ever seek again.

She sat with her hands tightly locked together in her lap, white, trembling, but immovable.

"There *is* another way, George. If you were—as he is now—would I not love you? You are the same to me as he is; you are dead to me!"

Her strength suddenly deserted her, and she broke into wild sobs. He knelt beside her and forced her gently into his arms.

"Cecil, you cannot put me out of your life, like this, with a word! You cannot mean to mock me with a love that denies our very humanity. It is nonsense to say I am dead to you, when every nerve in my body starts at your touch. Did *we* make that tie? It is the oldest, the strongest tie between man and woman. There is no duty that can break it. I am your duty and you are mine, in the sight of God."

She struggled to her feet. He rose, too, and stood before her, white with the passion of his last appeal.

"You have done your duty, in spite of the cost," she said. "Now I must do mine. I will try to be brave, too."

A belief that he must, in the end, prevail, had unconsciously supported him, and fed his persistence; but it forsook him now as he looked in her face. He continued to look at her a moment; something like a shiver passed over him; then his words came heavily, like the first sluggish drops following a deep wound which bleeds internally.

"Are you so sure that this is your duty?"

"You were very sure of yours," she faltered, dealing this last blow helplessly, and hearing herself speak as if her voice were the voice of some one else, pronouncing his doom and her own.

There was a loud knock on the outer door. The same ominous hand delivered it that had knocked in the watches of the night before. Cecil started at the sound and turned instinctively, in her terror, to Hilgard. It was the one moment when she might have yielded.

The knock was repeated. She made a gesture toward the door, and as Hilgard turned to open it she escaped from the room.

It was Gashwiler who stood on the threshold.

"Go to the other door!" Hilgard said, fierce with the anguish that was mounting in his blood.

His words were like a curse. The two men looked each other in the eyes for an instant, then Gashwiler retreated down the steps, and around the corner of the house to the kitchen.

Hilgard plunged through the melting drifts that hid the trail, dashing the wet snow from the low fir-boughs. A storm of revolt was let loose within him. He saw no justice, no logic, in his fate. Its mockery was yet in store for him.

(To be continued.)

## LES MORTS VONT VITE.

*Les morts vont vite!* Ay, for a little space  
We miss and mourn them, fallen from their place;  
To take our portion in their rest are fain;  
But by and by, having wept, press on again,  
Perchance to win their laurels in the race.

What man would find the old in the new love's face?  
Seek on the fresher lips the old kisses' trace?  
For withered roses newer blooms disdain?

*Les morts vont vite!*

But when disease brings thee in piteous case,  
Thou shalt thy dead recall, and thy ill grace  
To them for whom remembrance plead in vain.  
Then shuddering think, while thy bed-fellow Pain  
Clasps thee with arms that cling like Death's embrace:

*Les morts vont vite!*

H. C. Bunner.

## ARTHUR PENRHYN STANLEY.

A MAN of many gifts and graces has passed away; a man so singularly central in English society and amid English schools of thought, so individual and yet so multiform, that among the wreaths which bestrewed his tomb in Henry VII.'s chapel,—the offering of all nations, from Ireland to Armenia, of men of all opinions, from dignitaries of the church to scientific materialists, of all classes of society from the Queen of England to the poor children of Westminster,—it would be hard to say which tokens were the most natural, the most appropriate, the most sincere.

A man so many-sided should be described by many men; a man of such wide and active sympathies should be commemorated not by his intimates alone, but by others who have looked up to him as to a source of life and light; who have enjoyed, perhaps, some amities of a hereditary friendship, some encouragement of his cordial smile. Without repeating what has been already said, or anticipating what may be more fitly said by others, there is room for some such reflections on his work and character as will be suggested here.

The outward life of Arthur Stanley was so ordered from childhood upward as to enable him to mature and exercise his powers in the most favorable way, and to lead his receptive nature through scene after scene of sterling virtue or of old renown. The happy Rectory-home at Alderley gave to his after years the inestimable background of childish memories of unmingled brightness and peace. His intercourse with Dr. Arnold at Rugby showed the relation of teacher and pupil in its ideal form. At Oxford, the three great colleges of Balliol, University, Christ-Church, welcomed him in town, and each upbuilt some part of the fabric of his being. The ancient shrine of Canterbury fostered at once his historic instincts and his deep sense of the greatness of the English Church. And finally Westminster received him to an office so congenial to every aspiration of his heart that all else seemed to have been but a prolusion to those stately duties and an antechamber to that famous home. He was blessed too, in father and mother, in family and friends; blessed most of all in the wife whose presence doubled both his usefulness and his felicity, and whose loss gave to his latest years the crowning dignity of sorrow.

One incongruity alone was sometimes felt in this harmonious career,—a certain dis-

crepancy between Stanley's habits of thought and those of the clerical world around him. Scruples of this kind had led him to hesitate as to taking orders, but they had then been brushed aside with rough vigor by Arnold's friendly hand. But as Stanley rose into prominence his supposed laxity of dogmatic view gave umbrage to many members of his profession; he experienced "that difficulty" which, in his own words, "is occasioned not so much by the actual divergence of opinion amongst educated, or amongst uneducated men, as by the combination in the same religious and the same social community of different levels of education,"—and it may be added of original temperaments,—so diverse that their professors, however educated, must needs construe this perplexing universe in many varying ways. Dean Stanley's view of his own position in the church is given in a striking passage in the preface to his "Essays on Church and State":

"The choice is between absolute individual separation from every conceivable outward form of organization, and continuance in one or other of those which exist, in the hope of modifying or improving it. There are, doubtless, advantages in the former alternative. The path of a theologian or ecclesiastic, who in any existing system loves truth and seeks charity, is, indeed difficult at the best. Many a time would such a one gladly exchange the thankless labor, the bitter taunts, the "law's delay," the "insolence of office," the waste of energy, that belong to the friction of public duties, for the hope of a few tranquil years of independent research or studious leisure, where he need consult no scruples, contend with no prejudices, entangle himself with no party, travel far and wide over the earth, with nothing to check the constant increase of knowledge which such experience alone can fully give. But there is a counterbalancing attraction, which may well be felt by those who shrink from sacrificing their love of country to a sense of momentary relief, or the hopes of the future to the pressure of the present. To serve a great institution, and by serving it to endeavor to promote within it a vitality which shall secure it as the shelter for such as will have to continue the same struggle after they are gone, is an object for which much may be, and ought to be endured which otherwise would be intolerable."

This passage is interesting, moreover, as distinctly indicating Stanley's conception of the functions of a national church. A national church may be regarded as aiming at either of two somewhat different ends. We may say that it is meant to promulgate that body of spiritual truth which has, at a given historical epoch, approved itself to a given nation. Or we may say that it is meant to promulgate such spiritual truth as may, from

time to time approve itself to that nation as it lives and grows. On the first theory, the church must represent a fixed code in the midst of a changing world, as the Greek and Roman churches profess to do. On the second theory, it must modify its teaching, as the Reformed churches actually did, when the great mass of thinking men in a nation are seen to have modified their belief. Such changes can have no finality; and if a violent wrench like the English Reformation was justifiable, it must be still more justifiable, in those who now wish to maintain the national church, to introduce as gently as possible such changes as may keep her in sympathy with the advancing knowledge of the time. And these changes, though initiated by laymen, must be adopted by church dignitaries if they are to become a part of the established creed of the nation. It is noticeable, indeed, that in past centuries the same men have often been first denounced as heretics, and afterward accepted as pillars of the church, having carried through at their own risk some reform which was ultimately felt by all to be beneficial. It is needless to say that the recent rise of science, physical and historical, has effected an even greater alteration in men's mental outlook than was effected by the revival of learning, which led almost necessarily to the Reformation. If, then, the English Church is to maintain her position as national, she must be prepared to modify her teaching, with little delay, and such modification can best be carried through by men of Stanley's comprehensive sympathies and strong common-sense.

There remains, however, the question whether religious unity is really strongly desired by many men; whether the different sections of the English church or the English nation are disposed to make much effort to preserve the idea of a national church. And the answer commonly given is that such union is *not* strongly desired, that, on the other hand, men tend to hold views more divergent, and to express them with more distinctness, than ever before. It might, perhaps, have been expected that as the conclusions of science become more definite, as it grows easier to make men understand the same demonstrations and obey the same laws, it would also grow easier to unite them in the same religion. But this is not so; for religion is a matter of tastes and emotions, as well as of reason. Along with what is deepest and most universal its sphere includes all that is most individual and variable in man. It includes points on which classes of men at different mental levels—nay, even different individuals on the same level—cannot possibly be expected to

agree. On the one hand, as fresh bodies of men wake up to religion they inevitably pass through stages of thought and feeling which many of their contemporaries have already outgrown. And, on the other hand, learning and intellect, so far from securing uniformity, will, when combined with certain temperaments, only serve to make the cases of reverence to an older type, or of divergence into an individual type, more marked and impressive.

So long, in short, as the evidence as to an unseen world remains much where it is, that evidence will probably be interpreted as variously as heretofore. An accession of new evidence might, no doubt, lead to a greater unity of creed; but the possibility of such an accession of evidence is just what all sects unite to deny.

From the theological point of view, therefore, it may seem neither possible nor very important to maintain the Church of England. On the other hand, the political and the philanthropical arguments for a national church are strong. It is, or may be made, the safest bulwark against sectarian bigotry, the most efficient machinery for supplying the moral needs of the community. And there is also a historical point of view, of which Stanley was the best representative. It seemed to him a childish, almost an impious thing, that our disagreements on questions which, for the most part, we can neither solve nor comprehend, should lead us rashly to destroy that august institution which so many names have adorned, so many memories hallowed, which has spread her wide arms from pole to pole, and has embodied for centuries the spiritual life of a mighty people. How premature were such a dissolution! For no one knows what direction opinion will ultimately take; and the Church of England, which is committed to so much less than the Church of Rome, and which, with her allied churches in both hemispheres, stands already second in importance to the Church of Rome alone—the Church of England, it may well be said, has a better chance than any other religious corporation of finding herself erect after the general reconstruction, and constituting, in some sense or other, the Church of the Future. Should such a fate be hers, she will be grateful to those whose historical instinct saved her from disruption, who did not despair of the spiritual republic in times of inward conflict and dismay.

Descending from general principles to details, we find the peculiar type of Stanley's historical instinct: his delight in striking anecdote, in unlooked-for parallels, in the picturesqueness of the past,—well illustrated by his treatment, in his latest book, of the rites and symbols of the early church. To

the mystic, these symbols seem still instinct with spiritual truth. To the philosopher they suggest a field of unexhausted inquiry; they lead back the mind to the Seven Rivers of the Indus valley, to the worships of our Aryan ancestors in Persia or Babylon, to the remote and essential unity of the creeds of men. Stanley is not attracted in either of these ways. He does not deal with thought and emotion in their subterranean currents, but rather in their dramatic manifestation on the great theaters of the world. And he is never better pleased than when by some quaint juxtaposition he can show the irony of men's pretensions to dogmatic infallibility, or to the authority of immemorial tradition. In "Christian Institutions" it delights him to point out that the only true Sabbatarians are to be found in Abyssinia; that the kiss of peace was "one of the most indispensable of primitive practices," but is now preserved only by "the Glassites, or Sandemanians"; that although the Coptic church alone retains the original form of the Lord's Supper, some vestige of the true position is retained by the Presbyterians and the Pope. The Pope, in fact, is for Dean Stanley a perfect museum of paradoxes. While reflecting with regret that "Augustine would have condemned him as an unbaptized heretic," he is pleased to find in the peculiarities which surround him, "a mass of latent Primitive Protestantism." He traces with interest the origin of his white gown, his red shoes, his peacock fans; while he is careful to remind us that the only ecclesiastical vestment recognized by the early Fathers consisted of trowsers.

The breadth, and also the limitations of Stanley's view are well exemplified by his essay on the pictures in the catacombs of Rome. He draws out admirably from these figures the ἀγαλλίασις and ἀφελότης, the joy and simplicity of the primitive Church. There is found there no crucifix, no cypress, no death's-head, no dance of skeletons, no martyrdom of saints, but the young shepherd carrying the lamb amid green pastures, and dove-like souls that soar to heaven, and the mysterious gladness of the vine. All this he sees in that ancient imagery, but he does not attempt to explain its strange anomalies by any reference to a yet remoter past. He has no word of comment (for instance) on the view of those in whose eyes an occult tradition mingles here with the new-risen faith; who see in the *crux ansata*, with its recurved extremities, the cross of wood from whose central hollow our Aryan forefathers made spring the friction-fire; who discern in *Agnus* the mystic *Agni*, and in the lamb's luminous aureole the transmuted symbol of that Vedic flame.

We can indeed hardly claim for Stanley the title of an original investigator on any subject, save only the very difficult and interesting one of the geography of Sinai and Palestine. But it would be equally unfair to speak of such popularizations as his "Jewish Church" as though they were slight or easy productions. Crude knowledge must be digested and re-digested before it can enter vitally into the intellectual system of mankind, and rightly to assimilate such nutriment may often be as difficult as to collect it. The Englishman, especially, writing, as Stanley did, for two hemispheres and some half-dozen nations, must needs feel that the form in which he gives his results to this enormous public is a matter of no slight concern.

Of this, Dean Stanley, with his keen interest in America, his vivid sense that "westward the course of empire takes its way," was certain to be fully conscious. And he remembered it most of all when he dealt with that subject whose world-wide diffusion has given to it its chief importance. For the history and literature of England may be said to have had greatness thrust upon them. They have not been selected for universal study on account of their intrinsic interest and perfection, as have been the history and literature of Greece. But they belong to a race which happens to have just those qualities which enable it to overrun the earth. Whatever the history of such a race may be, the world must know it; whatever its literature, the world must study it. And in recounting the English Past no tone could be fitter than Dean Stanley's,—a tone indicating at once a glowing sense of the dignity of the story, and an honest consciousness of its many blots and imperfections. Long before Stanley was made Dean of Westminster, it was felt that the memories which hallow English ground appealed to no man more vividly than to him. And when he was placed, as it were, in official connection with English history,—when he was made the guardian of that pile of buildings which is to the British Empire,—nay, to all English-speaking lands,—almost what the Capitol was to Rome,—then indeed the thought of him became so inseparable from the thought of the Abbey that one knew not whether the man magnified the office, or the office the man.

It is there, in some part of that vast, irregular pile, that the memory of all who knew him will choose to imagine him still. Some will best recall him as he dispensed hospitality in the Deanery, or stood in that long library which seems immersed in silence and antiquity within a bow-shot of earth's busiest roar. These will remember his talk, its vi-

vacuity and simplicity, its tone as of a man accustomed to feel that his words carried weight, yet never grasping at an undue share in the conversation, nor failing to recognize the least contribution which those who spoke with him might bring. To those who recall such scenes he may well appear as the very type of civilization, of the manners to which birth and breeding, mind and character, add each their charm; which can show feeling without extravagance, and power without pride; which can convince men by comprehending them, and control with a smile.

To some, again, his image will present itself as he stood in his pulpit in the nave of Westminster, or by the tomb of some great man departed, or before the altar on the rare occasions when the solemn Abbey opened its portals to a scene of marriage-joy. These will recall the voice of delicate resonance, the look of force and dignity enhanced by the contrast with a body so small and frail; and, above all, that efflux of vivid human fellowship which all men felt when he was near, the sense of the responsive presence of a living soul.

He lies where he had most truly lived. Beside him, in the niche of Henry VII.'s chapel, is laid the wife to whom, in his own solemn words, the earthly union was but designed to link him "till death us join" in some bond more sacred still. Above him float the banners of his knightly Order of the Bath, whose ideal chivalry and purity have

never an earthly embodiment more chivalrous or more pure. The chapel opens into the mighty Abbey, solemn and noble as work of men's hands can be, yet filled with tombs and tablets miscellaneous as life, incongruous as history. Many a strange shape is there: Rodney's captains, and Admiral Tyrrell rising from the sea, and the monstrous image of Watt; but, in the midst, still rises the shrine of the Confessor, and the fifth Henry's helm, with the dints of Agincourt, hangs in the dusky air.

It may be that, in ages to come, those who tell the roll of England's worthies in the aisles of Westminster may think that Stanley's name stood higher with his contemporaries than any definite achievement of his could warrant. We cannot correct the judgments of posterity; but we may feel assured that if it had been allowed us to prolong, from generation to generation, some one man's earthly days, we could hardly have sent any pilgrim across the centuries more wholly welcome than Arthur Stanley, to whatever times are yet to be. For they, like us, would have recognized in him a spectator whose vivid interest seemed to give to this world's spectacle an added zest; an influence of such a nature as humanity, howsoever it may be perfected, will only prize the more; a life bound up and incorporated with the advance and weal of men; a presence never to be forgotten, and irreplaceable, and beloved.

*Frederic W. H. Myers.*

---

## THE TWO ENCHANTMENTS.

Oh, hear from yonder height  
That glorious trumpet sounding!  
How fierce my pulses beat!  
But in the valley bright  
The rebecs are resounding:  
How sweet, how magic sweet!  
Ah, whither shall I go?

See now upon the height  
Those mighty shapes advancing,  
So radiant, yet so far!  
But in the valley bright  
The youths and maidens dancing,  
How beautiful they are!  
Oh, whither shall I go?

How grand about the height  
Fame's noble army winding  
To pinnacles above!  
But in the valley bright,  
Her hair with roses binding,  
Lingers the maid I love:  
Ah, whither shall I go?

*Henry Ames Blood.*

## WHO ARE THE CREOLES?

BY GEORGE W. CABLE,

Author of "Old Creole Days," "The Grandissimes," etc.

MAP OF LOUISIANA.

I.

### THEIR HOME.

ONE city in the United States is, without pretension or intention, picturesque and antique. A quaint Southern-European aspect is encountered in the narrow streets of its early boundaries, on its old Place d'Armes, along its balconied façades, and about its cool, flowery inner courts.

Among the great confederation of States whose Anglo-Saxon life and inspiration swallows up all alien immigrations, there is one in which a Latin civilization, sinewy, valiant, cultured, rich and proud, holds out against extinction. There is a people in the midst of the population of Louisiana, who send representatives and senators to the Fed-

eral Congress, and who vote for the nation's rulers. They celebrate the Fourth of July; and ten days thereafter, with far greater enthusiasm, they commemorate that great Fourteenth that saw the fall of the Bastille. Other citizens of the United States, but not themselves, they call Americans. Let us see who and where they are.

About half the State of Louisiana is hilly. The portion north of Lake Pontchartrain and east of the Mississippi, and that which lies north of Red River and west of the Washita, are mostly of this character. Their white population is mainly Anglo-American.

But if we draw a line from the southwestern to the north-eastern corner of the State, turning thence down the Mississippi

THE CATHEDRAL AND OLD PLACE D'ARMES, NEW ORLEANS.

to Baton Rouge, crossing eastward through Lakes Maurepas, Pontchartrain, and Borgne, to the Gulf of Mexico, and then passing along the gulf-coast to the starting-point at the mouth of the Sabine, it will indicate rudely, but sufficiently, the State's eighteen thousand seven hundred and fifty square miles of delta lands.

That portion lying north of Red River is, like the regions west of it, occupied principally by Anglo-Americans and blacks, and may be disregarded for the present, since the Creoles are not there.

Across the southern end of the State, from Sabine Lake to Chandeleur Bay, with a north-and-south width of from ten to thirty miles and an average of about fifteen, stretch the Gulf marshes, the wild haunt of myriads of birds and water-fowl, serpents and saurians, hares, raccoons, wild-cats, deep-bellowing frogs, and clouds of insects, and by a few hunters and oystermen, whose solitary and rarely frequented huts speck the wide, green horizon at remote intervals. Neither is the home of the Creoles to be found here.

VOL. XXV.—35.

North of these marshes and west of the Bayou Têche lies a beautiful expanse of faintly undulating prairie, some thirty-nine hundred square miles in extent, dotted with artificial homestead groves, with fields of sugar-cane, cotton, and corn, and with herds of ponies and keen-horned cattle feeding on its short, nutritious turf. Their herdsmen speak an ancient French patois, and have the blue eyes and light brown hair of Northern France.

The remaining division, which the description of the others has thus circumscribed, is of that character popularly accepted as typical of Louisiana entire: a labyrinth of small lakes and streams, bounded by low, alluvial banks, green, in season, with stretches of sugar-cane, corn, and rice, or white with cotton, and sloping gently downward and backward away from the water's edge into densely wooded and noxious swamps, whose tangled depths are penetrable only by the hunter's or wood-cutter's canoe.

In these two latter divisions, the prairie country and the swamp country, dwell most of the French-speaking people of Louisiana,

both white and colored. Here the names of bayous, lakes, villages, and plantations are, for the most part, French; the parishes (counties) are named after saints and church-feasts, and although for more than fifty years there has been an inflow of Anglo-Americans and English-speaking blacks, the youth still receive their education principally from the priests and nuns of small colleges and convents, and two languages are current: in law and trade, English; at home, French.

Here are still found the children of those famed Nova Scotian exiles, whose banishment from their homes by British arms in 1755 has so often been celebrated in history and romance, and who yet bear the name of Acadians. In some districts they are outnumbered; but in others, especially in the vast prairies of Attakapas and Opelousas, they largely outnumber those who endeavor to monopolize the more pretentious appellation of Creole.

But the Creoles pure and simple are principally found in the country lying between the mouth of Red River on the north and the Gulf marshes on the south, east of the Têche and south of Lakes Borgne, Pontchartrain, and Maurepas, and the Bayou Manchac. Near the south-eastern limit of this region is the spot where their French ancestors first struck permanent root, and the growth of their peculiar and interesting civilization began.

## II.

## ORLEANS ISLAND.

LOCATION CHART, NEW ORLEANS, LA.

LET us give a final glance at the map. It is the general belief that a line of elevated land,

now some eighty or ninety miles due north of the Louisiana coast, is the prehistoric shore of the Gulf. A range of high, abrupt hills or bluffs, which the Mississippi first encounters at the city of Vicksburg, and whose south-westward and then southward trend it follows thereafter to the town of Baton Rouge, swerves, just below this point, rapidly to a due east course, and declines gradually until, some thirty miles short of the eastern boundary of Louisiana, it sinks entirely down into a broad tract of sea-marsh that skirts, for many leagues, the waters of Mississippi Sound.

Close along under these subsiding bluffs, where they stretch to the east, the Bayou Manchac, once Iberville River, and the lakes beyond it, before the bayou was artificially obstructed, united the waters of Mississippi River with those of Mississippi Sound. Apparently this line of water was once the river itself. Now, however, the great flood, turning less abruptly, takes a south-easterly course, and, in so doing, cuts off between itself and its ancient channel a portion of its own delta formation. This fragment of half-made country, comprising something over seventeen hundred square miles of river-shore, swamp-land, and marsh, was once widely known, both in commerce and in international politics, as Orleans Island.

Its outline is extremely irregular. At one place, it is fifty-seven miles across from the river shore to the eastern edge of the marshes. Near the lower end there is scarcely the range of a "musket-shot" between river and sea. At a point almost midway of the island's length, the river and Lake Pontchartrain approach to within six miles of each other. It was here that, in February, 1718, was founded the city of New Orleans.

In 1699, three transatlantic powers, almost at the same moment, had essayed to occupy the southern outlet of the Mississippi valley. D'Iberville, in command of a French fleet sent from Brest for this purpose, had found the Spaniards just establishing themselves at Pensacola, and too old in diplomacy to listen to his fair speeches; wherefore he had sailed farther west and planted his colony on the eastern shore of Biloxi Bay. His young brother, Bienville, only a few weeks later, while exploring the waterways of the country westward, had met a British officer ascending the Mississippi with two vessels, in search of a spot favorable for colonization, and by ingenious words had induced him to withdraw, at a point where a long bend of the river is still known as the English Turn.

During the nineteen years that followed,

the colony of Louisiana never exceeded a few hundred souls. D'Iberville had left as governor his brother, Sauvolle, who, dying two years after, had been succeeded by Bienville. This young midshipman of twenty-four

Mississippi. Bienville, from the beginning, urged this wiser design. For years he was overruled under the commercial policy of the merchant monopolist, Anthony Crozat, to whom the French king had farmed the province. But when Crozat's large but unremunerative privileges fell into the hands of John Law, director-general of the renowned Mississippi Company, Bienville's counsel prevailed, and steps were taken for removing to the banks of the Mississippi the handful of French and Canadians who were struggling against starvation, in their irrational search after sudden wealth on the sterile beaches of Mississippi Sound and Massacre Island.

The first rude structure of logs had hardly been erected at Biloxi, before Bienville had become the foremost explorer of the colony. The year before he secured this coveted authorization to found a new post on the Mississippi, he had selected its site. It was immediately on the bank of the stream. No later sagacity has succeeded in pointing out a more favorable site on which to put up the gates of the great valley; and here—though the land was only ten feet above sea-level at the water's edge, and sank quickly back to a minimum height of a few inches; though it was almost wholly covered with a cypress swamp and was visibly subject to frequent, if not annual overflow; and though a hundred miles lay between it and the mouth of a river whose current, in times of flood, it was maintained, no vessel could overcome—here, Bienville, in 1718, placed a detachment of twenty-five convicts and as many carpenters, who, with some voyageurs from the Illinois River, made a clearing and erected a few scattered huts along the bank of the river, as the beginning of that which he was determined later to make his capital.

### III.

#### THE CREOLES' CITY.

was the seventh of a remarkably brilliant group of brothers, sons of Lemoyne de Bienville, a gentleman of Quebec. The governorship of the province, which he thus early assumed, he did not finally lay down until he had reached the age of sixty-five, and had more than earned the title of "the father of Louisiana"; and he was on one occasion still her advocate before the minister of France, when bowed by the weight of eighty-six years.

D'Iberville was the original projector and founder of New Orleans. From the first, the colony had been divided into two factions: one bent on finding gold and silver, on pearl-fishing, a fur trade, and a commerce with South America, and, therefore, in favor of a sea-coast establishment; the other advocating the importation of French agriculturists, and their settlement on the alluvial banks of the

MISSISSIPPI. Bienville, from the beginning, urged this wiser design. For years he was overruled under the commercial policy of the merchant monopolist, Anthony Crozat, to whom the French king had farmed the province. But when Crozat's large but unremunerative privileges fell into the hands of John Law, director-general of the renowned Mississippi Company, Bienville's counsel prevailed, and steps were taken for removing to the banks of the Mississippi the handful of French and Canadians who were struggling against starvation, in their irrational search after sudden wealth on the sterile beaches of Mississippi Sound and Massacre Island.

The first rude structure of logs had hardly been erected at Biloxi, before Bienville had become the foremost explorer of the colony. The year before he secured this coveted authorization to found a new post on the Mississippi, he had selected its site. It was immediately on the bank of the stream. No later sagacity has succeeded in pointing out a more favorable site on which to put up the gates of the great valley; and here—though the land was only ten feet above sea-level at the water's edge, and sank quickly back to a minimum height of a few inches; though it was almost wholly covered with a cypress swamp and was visibly subject to frequent, if not annual overflow; and though a hundred miles lay between it and the mouth of a river whose current, in times of flood, it was maintained, no vessel could overcome—here, Bienville, in 1718, placed a detachment of twenty-five convicts and as many carpenters, who, with some voyageurs from the Illinois River, made a clearing and erected a few scattered huts along the bank of the river, as the beginning of that which he was determined later to make his capital.

FROM THE RELIEF IN THE NEW ORLEANS CUSTOM-HOUSE.

THE OLD CONVENT.

tlement "to choose a suitable site for a city worthy to become the capital of Louisiana."

Thereupon might have been seen this engineer, the *Sieur Le Blond de la Tour*, in the garb of a knight of St. Louis, modified as might be by the exigencies of the frontier, in command of a force of galley-slaves and artisans, driving stakes, drawing lines, marking off streets and lots, a place for the

church and a middle front square for a place-d'armes; day by day ditching and palisading; throwing up a rude levee along the river front, and gradually gathering the scattered settlers of the neighborhood into the form of a town. But the location remained the same.

A hundred frail palisade huts, some rude shelters of larger size to serve as church,

IN THE NEW CONVENT GARDEN.

hospital, government house, and company's warehouses, a few vessels at anchor in the muddy river, a population of three hundred, mostly men—such was the dreary hunter's camp, hidden in the stifling undergrowth of the half-cleared, miry ground, where, in the naming of streets, the dukes of Orleans, Chartres, Maine, and Bourbon, the princes of Conti and Condé, and the Count of Toulouse, had been honored; where, finally, in June to August, 1722, the royal commissioners consenting, the company's effects and troops were gradually removed and Bienville set up his head-quarters; and where this was but just done when, in September, a tornado whisked away church, hospital, and thirty dwellings, prostrated the crops, and, in particular, destroyed the rice.

The next year, 1723, brought no better fortune. At home, the distended Mississippi Bubble began to show its filminess, and the distress which it spread everywhere came across the Atlantic. As in France, the momentary stay-stomach was credit. On this basis the company's agents and the plantation grantees harmonized; new industries, notably indigo culture, were introduced; debts were paid with paper, and the embryo city reached the number of sixteen hundred inhabitants; an agricultural province, whose far-scattered plantations, missions, and military posts counted nearly five thousand souls, promised her its commercial tribute.

Then followed collapse, the scaling of debts by royal edict, four repetitions of this gross expedient, and, by 1726, a sounder, though a shorn, prosperity.

The year 1728 completed the first decade of the town's existence. Few who know its history will stand to-day in Jackson square and glance from its quaint, old-fashioned gardening to the foreign and antique aspect of the surrounding architecture,—its broad verandas, its deep arcades, the graceful patterns of its old wrought-iron balconies, its rich effects of color, of blinding sunlight, and of cool shadow,—without finding the fancy presently stirred up to overleap the beginning of even these time-stained features, and recall the humbler town of Jean-Baptiste Lemoyne de Bienville, as it huddled about this classic spot when but ten years had passed since the first blow of the settler's ax had echoed across the waters of the Mississippi.

This, from the beginning, was the Place d'Armes. It was of the same rectangular figure it has to-day: larger only by the width of the present sidewalks, an open plat of coarse, native grass, crossed by two diagonal paths and occupying the exact middle of the

town front. Behind it, in the mid-front of a like apportionment of ground reserved for ecclesiastical uses, where St. Louis Cathedral now overlooks the square, stood the church, built, like most of the public buildings, of brick. On the church's right were a small guard-house and prisons, and on the left the dwelling of some Capuchins. The spiritual care of all that portion of the province between the mouths of the Mississippi and the Illinois was theirs. On the front of the square that flanked the Place d'Armes above, the government-house looked out upon the river. In the corresponding square, on the lower side, but facing from the river and diagonally opposite the Capuchins, were the quarters of the government employés. The grounds that faced the upper and lower sides of the Place d'Armes were still unoccupied, except by cordwood, entrenching tools, and a few pieces of parked artillery, on the one side, and a small house for issuing rations on the other. Just off the river front, in Toulouse street, were the smithies of the Marine; correspondingly placed in Du Maine street were two long, narrow buildings, the king's warehouses.

Ursulines street was then Arsenal street. On its first upper corner was the hospital, with its grounds extending back to the street behind; while the empty square opposite, below, reserved for an arsenal, was just receiving, instead, the foundations of the convent-building that stands there to-day. A company of Ursuline nuns had come the year before from France to open a school for girls, and to attend the sick in hospital, and were quartered at the other end of the town awaiting the construction of their nunnery. It was finished in 1730. They occupied it for ninety-four years, and vacated it only in 1824 to remove to the larger and more retired convent on the river shore, near the present lower limits of the city, where they remain at the present day. The older house—one of the oldest, if not the oldest building, standing in the Mississippi Valley—became, in 1831, the State-house, and in 1834, as at present, the seat of the archbishop of Louisiana.

For the rest, there was little but forlorn confusion. Though the plan of the town comprised a parallelogram of five thousand feet river front by a depth of eighteen hundred, and was divided into regular squares of three hundred feet front and breadth, yet the appearance of the place was disorderly and squalid. A few cabins of split boards, thatched with cypress bark, were scattered confusedly over the ground, surrounded and isolated from each other by willow-brakes and reedy

ponds and sloughs bristling with dwarf palmetto and swarming with reptiles. No one had built beyond Dauphine street, the fifth from the river, though twenty-two squares stood empty to choose among; nor below the hospital, nor above Bienville street, except that the governor himself dwelt at the extreme upper corner of the town, now the corner of Customhouse and Decatur streets. Orleans street, cutting the town transversely in half behind the church, was a quarter favored by the unimportant; while along the water-front, and also in Chartres and Royale streets, just behind, rose the homes of the colony's official and commercial potentates: some small, low, and built of cypress, others of brick, or brick and frame, broad, and two or two and a half stories in height. But about and over all was the rank growth of a wet semi-tropical land, especially the water-willow, planted here and there in avenues, and elsewhere springing up at wild random amid occasional essays at gardening.

Such was New Orleans in 1728. The restraints of social life had, until now, been few and weak. Some of the higher officials had brought their wives from France, and a few Canadians theirs from Canada; but they were a small fraction of all. The mass of the men, principally soldiers, trappers, redemptioners bound to three years' service, miners, galley-slaves, knew little, and cared less, for citizenship or public order; while the women, still few, were almost all the unreformed and forcibly transported inmates of houses of correction, with a few Choctaw squaws and African slaves. Gambling, dueling, and vicious idleness were indulged in to a degree that gave the authorities grave concern.\*

Now the company, as required by its charter, had begun to improve the social as well as the architectural features of its provincial capital. The importation of male vagabonds had ceased; stringent penalties had been laid upon gambling, and, as already noted, steps had been taken to promote education and religion. The aid of the Jesuits had been enlisted for the training of the male youth and the advancement of agriculture.

In the winter of 1727-28 a crowning benefit had been reached in the arrival from France of the initial consignment of reputable girls, allotted to the care of the Ursulines, to be disposed of under their discretion in marriage. They were supplied by the king, on their departure from France, each with a small chest of clothing, and, with similar companies imported in subsequent years, were long known in the traditions of their colo-

nial descendants by the honorable distinction of the "*filles à la cassette*,"—the girls with trunks, the casket-girls. There cannot but linger a regret around this slender fact, so full of romance and the best poetry of real life. But the Creoles have never been careful for the authentication of their traditions, and the only assurance left to us so late as this is that the good blood of these modest maidens of long-forgotten names and of the brave soldiers to whom they gave their hands with the king's assent and dower, flows in the veins of the best Creole families of the present day.

Thus, at the end of the first ten years, the town summed up all the true, though roughly outlined, features of a civilized community: the church, the school, courts, hospital, council-hall, virtuous homes, a military arm and a commerce. This last was fettered by the monopoly rights of the company; but the thirst for gold, silver, and pearls had yielded to wiser thought, a fur trade had developed, and the scheme of an agricultural colony was rewarded with success.

But of this town and province, to whose development their founder had dedicated all his energies and sagacity, Bienville was no longer governor. In October, 1726, the schemes of official rivals had procured not only his displacement, but that of his various kinsmen in the colony. It was under a new commandant-general, M. Périer, that protection from flood received noteworthy attention, and that the first levee worthy of the name was built on the bank of the Mississippi. On the 15th of November, 1726, he completed a levee of eighteen feet crown, exceeding in length the entire front of the town; later, he continued it on smaller proportions eighteen miles up, and as many down the stream.

#### IV.

#### FARMS AND FORESTS IN THE DELTA.

THE Mississippi Company's agricultural colonial scheme was based on the West Indian idea of African slave labor. Already the total number of blacks had risen to equal that of the whites, and within the Delta, outside of New Orleans, they must have largely preponderated. In 1727 this idea began to be put into effect just without the town's upper boundary, where the Jesuit fathers accommodated themselves to it in model form, and between 1726 and 1745 gradually acquired and put under cultivation the whole tract of land now covered by the First District of New Orleans, the center of the city's wealth and commerce. The slender, wedge-shaped

\* "Sans religion, sans justice, sans discipline, sans ordre, et sans police."—*Drouet de Valdeterre*.

space between Common and Canal streets, and the subsequent accretions of soil on the river front, are the only parts of the First District not once comprised in the Jesuits' plantations. Education seems not to have had their immediate attention, but a myrtle orchard was planted on their river-front, and the orange, fig, and sugar-cane were introduced by them into the country at later intervals.

Other and older plantations were yearly sending in the products of the same unfortunate agricultural system. The wheat and the flour from the Illinois and the Wabash were the results of free farm and mill labor; but the tobacco, the timber, the indigo, and the rice came mainly from the slave-tilled fields of the company's grantees scattered at wide intervals in the more accessible regions of the great Delta. The only free labor of any note employed within that basin was a company of Alsatians, which had been originally settled on the Arkansas by John Law, but which had descended to within some thirty miles of New Orleans, had there become the market-gardeners of the growing town, and, in more than one adverse season, had been its main stay.

If this system of livelihood was so widely different from that of the transatlantic civilization from which the colonist of the Mississippi Delta had been drawn, the face of nature was not less altered. He found the swamp country of Louisiana a region of incessant and curious natural paradoxes. The feature, elsewhere so nearly universal, of streams rising from elevated sources, growing by tributary inflow, and moving on to empty into larger water-courses, was entirely absent. The circuit of inland water supply, to which his observation was accustomed,—commencing with evaporation from remote watery expanses, and ending with the junction of streams and their down-flow to the sea,—he here saw in great part reversed; it began with the influx of streams into and over the land, and though it included the seaward movement in the channels of main streams, yet it yielded up no small part of its volume by an enormous evaporation from millions of acres of overflowed swamp. It was not in the general rise of waters, but in their subsidence, that the smaller streams delivered their contents toward the sea. From Red River to the Gulf the early explorers of Louisiana found the Mississippi, on its western side, receiving no true tributary; but, instead, all streams, though tending toward the sea, yet doing so by a course directed away from some larger channel. Being the offspring of the larger streams, and either still issuing from them or being cut off from them only by the growth of sedimentary de-

posits, these smaller bodies were seen taking their course obliquely away from the greater, along the natural aqueducts raised slightly above the general level by the deposit of their own alluvion. This deposit, therefore, formed the bed and banks of each stream, and spread outward and gently downward on each side of it, varying in width from a mile to a few yards, in proportion to the size of the stream and the distance from its mouth.

Such streams called for a new generic term, and these explorers, generally military engineers, named them bayous, or boyaus: in fortification, a branch trench. The Lafourche ("the fork"), the Bœuf, and other bayous were manifestly mouths of the Red and the Mississippi, gradually grown longer and longer through thousands of years. From these the lesser bayous branched off confusedly hither and thither on their reversed watersheds, not tributaries, but, except in low water, tribute takers, bearing off the sediment-laden back waters of the swollen channels, broad-casting it in the intervening swamps, and, as the time of subsidence came on, returning them, greatly diminished by evaporation, in dark, wood-stained, and sluggish, but clear streams. The whole system was one primarily of irrigation, and only secondarily of drainage.

On the banks of this immense fretwork of natural dykes and sluices, though navigation is still slow, circuitous and impeded with risks, now lie hundreds of miles of the richest plantations in America; and here it was that the French colonists, first on the Mississippi and later on the great bayous, laid the foundations of the State's agricultural wealth.

The scenery of this land, where it is still in its wild state, is weird and funereal; but on the banks of the large bayous, broad fields of corn, of cotton, of cane, and of rice, open out at frequent intervals on either side of the bayou, pushing back the dark, pall-like curtain of moss-draped swamp, and presenting to the passing eye the neat and often imposing residence of the planter, the white double row of field-hands' cabins, the tall red chimney and broad gray roof of the sugar-house, and beside it the huge, square, red brick bagasse-burner, into which, during the grinding season, the residuum of crushed sugar-cane passes unceasingly day and night, and is consumed with the smoke and glare of a conflagration.

Even when the forests close in upon the banks of the stream there is a wild and solemn beauty in the shifting scene which appeals to the imagination with special strength when the cool morning lights or the warmer glows of evening impart the colors of the atmosphere

to the surrounding wilderness, and to the glassy waters of the narrow and tortuous bayous that move among its shadows. In the last hour of day, these scenes are often illuminated with an extraordinary splendor. From the boughs of the dark, broad-spreading live-oak, and the phantom-like arms of lofty cypresses, the long, motionless pendants of pale gray moss point down to their inverted images in the unruffled waters beneath them. Nothing breaks the wide-spread silence. The light of the declining sun at one moment brightens the tops of the cypresses, at another glows like a furnace behind their black branches, or, as the voyager reaches a western turn of the bayou, swings slowly round, and broadens down in dazzling crimsons and purples upon the mirror of the stream. Now and then, from out some hazy shadow, a heron, white or blue, takes silent flight, an alligator crossing the stream sends out long, tinted bars of widening ripple, or on some high, fire-blackened tree a flock of roosting vultures, silhouetted on the sky, linger with half-opened, unwilling wing, and flap away by ones and twos until the tree is bare. Should the traveler descry, first as a mote intensely black in the midst of the brilliancy that overspreads the water, and by and by revealing itself in true outline and proportion as a small canoe containing two men, whose weight seems about to engulf it, and by whose paddle-strokes it is impelled with such evenness and speed that a long, glassy wave gleams continually at either side, a full inch higher than the edge of the boat, he will have before him a picture of nature and human life that might have been seen at any time since the French fathers of the Louisiana Creoles colonized the Delta.

## v.

## INDIAN WARS.

THE Indians in the lower part of the Mississippi Valley had welcomed the settling of the French with feasting and dancing. The erection of forts among them at Biloxi, Mobile, the Natchez bluffs, and elsewhere, gave no confessed offense. Their game, the spoils of their traps, their lentils, their corn, and their woodcraft were always at the white man's service, and had, more than once, come between him and starvation. They were not the less acceptable because their donors counted on generous offsets in powder and ball, brandy, blankets, and gewgaws.

In the Delta proper, the Indians were a weak and divided remnant of the Alibamon race, dwelling in scattered sub-tribal villages

of a few scores or hundreds of warriors each. It was only beyond these limits that the powerful nations of the Choctaws, the Chickasaws, and the Natchez, offered any suggestion of possible war.

Bienville had, from his first contact with them, shown a thorough knowledge of the Indian character. By a patronage supported on one side by inflexibility, and on the other by good faith, he inspired the respect and confidence of all alike; and, for thirty years, neither the slothful and stupid Alibamons of the Delta nor the proud and fierce nations around his distant posts gave any serious cause to fear the disappearance of good-will.

But M. Périer, who had succeeded Bienville, though upright in his relations with his ministerial superiors, was more harsh than wise, and one of his subordinates, holding the command of Fort Rosalie, among the Natchez (a position of the greatest delicacy), was arrogant, cruel, and unjust. Bienville had not long been displaced when it began to be likely that the Frenchmen who had come to plant a civilization in the swamps of Louisiana, under circumstances and surroundings so new and strange as those we have noticed, would have to take into their problem of development the additional factor of a warfare with the savages of the country.

When the issue came, its bloody scenes were far removed from that region which has grown to be specially the land of the Creoles; and, in that region, neither Frenchman nor Creole was ever forced to confront the necessity of defending his home from the torch, or his wife and children from the tomahawk.

The first symptom of danger was the visible discontent of the Chickasaws, with whom the English were in amity, and of the Choctaws. Périer, however, called a council of their chiefs in New Orleans, and these departed with protestations of friendship and loyalty that deceived him.

Suddenly, in the winter of 1729-30, a single soldier arrived in New Orleans from Fort Rosalie, with the word that the Natchez had surprised and destroyed the place, massacred over two hundred men, and taken captive ninety-two women and one hundred and fifty-five children. A few others, who, with their forerunner, were all who had escaped, appeared soon after and confirmed the news. Smaller settlements on the Yazoo River and on Sicily Island, on the Washita, had shared a like fate.

In New Orleans all was confusion and alarm, with preparations for war, offensive and defensive. Arms and ammunition were hurriedly furnished to every house in the town and on the neighboring plantations. Through

the weedy streets and in from the adjacent country, along the levee top and by the plantation roads and causeways, the militia, and, from their wretched barracks in Royale street, the dilapidated regulars, rallied to the Place d'Armes. Thence the governor presently dispatched three hundred of each, under one of his captains, to the seat of war. The entrenching tools and artillery were brought out of the empty lot in St. Peter street, and a broad moat was begun, on which work was not abandoned until at the end of a year the town was, for the first time, surrounded with a line of rude fortifications.

Meantime, the burdens of war distributed themselves upon the passive as well as upon the active: terror of attack, sudden alarms, false hopes, anxious suspense, further militia levies, the issue of colonial paper, industrial stagnation, the care of homeless refugees, and, by no means least, the restiveness of the negroes. The bad effects of slave-holding began to show themselves. The nearness of some small vagrant bands of friendly Indians, habitual hangers-on of the settlement, became "a subject of terror," and, with a like fear of the blacks, led to an act of shocking cruelty. A band of negroes, slaves of the company, armed and sent for the purpose by Périer himself, fell upon a small party of chouachas Indians dwelling peaceably on the town's lower border, and massacred the entire village. Emboldened by this, the negroes plotted a blow for their own freedom; but their plans were discovered and the leaders were executed. In the year after, the same blacks, incited by fugitive slaves sent among them by the Chickasaws, agreed upon a night for the massacre of the whites; but a negress who had been struck by a soldier let slip the secret in her threats, and the ringleaders, eight men and the woman, were put to death, she on the gallows and they on the wheel. The men's heads were stuck upon posts at the upper and lower ends of the town front, and at the Tchoupitoulas settlement and the king's plantation on the farther side of the Mississippi.

We now turn a page of the record that shows human nature in a kindlier aspect. Two hundred and fifty women and children taken by the Natchez had been retaken, and were brought to New Orleans and landed on the Place d'Armes. There they were received by the people with tears and laughter and open arms. At first, room was made for them in the public hospital; but the Ursulines, probably having just moved into their completed convent, adopted the orphan girls. The boys found foster-parents in well-to-do families, and the whole number of refugees was pres-

ently absorbed, many of the widows again becoming wives.

The Chickasaws and Yazoos became allies of the Natchez, and the Choctaws of the French. But space does not permit nor our object require us to follow the camp of the latter, to recount their somewhat dilatory successes on the Natchez hills, and in the swamps of the Washita, or on the distant banks of Red River under the intrepid St. Denis. The Natchez nation was completely dismembered. The few survivors were adopted into the Chickasaw nation, and by repeated depredations, they qualified the limited peace that followed.

In 1733, Bienville was restored to the governorship; but his power to command the confidence and good faith of the savages was lost. In 1735, aggressions still continuing, he demanded of the Chickasaws the surrender of their Natchez and Yazoo refugees, and was refused. Thereupon he was ordered to make war, and the early spring of 1736 saw New Orleans again in the stirring confusion of marshaling a small army. The scene of its embarkation was the little village of St. John, on the bayou of that name, where, in thirty barges and as many canoes, this motley gathering of uniformed regulars, leather-shirted militia, naked blacks, and feathered and painted Indians, set out, by way of the lakes and the Alabama River, to exterminate the Chickasaws. A few months passed, and the same spot witnessed another scene, when Bienville disembarked the remnant of his forces, sick, wounded, and discouraged, after a short, inglorious, and disastrous campaign in northern Alabama.

Bienville's years—he was now fifty-six—will hardly account for the absence of that force and sagacity which had once made him so admirable and of such great value; but whatever may have been the cause, the colonists, in whose affections he still held the foremost place, found in him only a faltering and mismanaging leader into disasters, whose record continued from this time to be an unbroken series of pathetic failures.

The year 1739 saw the French authority still defied and the colony's frontier harrassed. In September, Bienville mustered another force. The regulars, the militia, three companies of marines lately from France, and sixteen hundred Indians, filed out through Tchoupitoulas gate and started for the Chickasaw country, this time by way of the Mississippi. At the present site of Memphis, they were joined by levies from Canada and elsewhere, and Bienville counted a total force in hand of thirty-six hundred men, white, red, and black. No equal force had ever taken the field in Louisiana. But plans had miscarried, provis-

ions were failing, ill-health was general, the wide country lying eastward and still to be crossed was full of swollen streams, and when the little army again took up the line of march, it actually found itself in full retreat without having reached the enemy's country. Only a detachment of some six or seven hundred Canadians, French and northern-Indians, under a subordinate officer, moved upon the Chickasaws, and meeting them with sudden energy, before their own weakness could be discovered, extorted some feeble concessions in exchange for peace. In the spring of 1740 Bienville returned with a sick and starving remnant of his men, and with no better result than a discreditable compromise.

Ten years of unrest, of struggle against savage aggression, and for the mastery over two other races, had now passed. Meantime, the commerce of the colony had begun to have a history. The Company of the Indies, into which the *Compagnie de l'Occident*, or Mississippi Company, had been absorbed, discouraged by the Natchez war and better pleased with its privileges on the Guinea coast, and in the East Indies, had, as early as June, 1731, tendered, and in April had effected, the surrender of its western charter. The king had thereupon established between Louisiana and his subjects elsewhere a virtual free-trade; a fresh intercourse had sprung up with France and the West Indies; an immigration had set in from these islands, and, despite the Chickasaw campaigns and paper money, had increased from year to year. At the close of these campaigns, business further revived, and the town, as it never had done before, began spontaneously to develop from within outward by the enterprise of its own inhabitants.

The colony's star was rising, but Bienville's was still going down. The new prosperity and growth was not attributed, nor is it traceable, to his continued government. As time passed on he was made easily to see that he had lost the favor of the French minister. He begged to be recalled; and in May, 1743, on the arrival of the Marquis de Vaudreuil as his successor, he bade a last farewell to the city he had founded and to that Louisiana of which it was proper for the people still to call him "the father."

## VI.

### THE NEW GENERATION.

WHEN, on the 10th of May, 1743, the Marquis de Vaudreuil landed in New Orleans, private enterprise,—the true foundation of material prosperity,—was firmly established.

Indigo, rice, and tobacco were moving in quantity to Europe, and lumber to the West Indies. Ships that went out loaded came back loaded again, especially from St. Domingo; and traffic with the Indians, and with the growing white population along the immense length of the Mississippi and its tributaries, was bringing money into the town and multiplying business year by year.

Hope ran high when the marquis was appointed. His family had much influence at court, and anticipations were bright of royal patronage and enterprise in the colony and in its capital. But these expectations, particularly as to New Orleans, were feebly met. There was an increase in the number of the troops and a great enhancement of superficial military splendor, with an unscrupulous getting and reckless spending of Government goods and money, and a large importation of pretentious frivolity from the Bourbon camps and palaces. By 1751, every second man in the streets of New Orleans was a soldier in dazzling uniform. They called the governor the "Grand Marquis." He was graceful and comely, dignified in bearing, fascinating in address, amiable, lavish, fond of pleasure, and, with his marchioness, during the twelve years of his sojourn in Louisiana, maintained the little colonial court with great pomp and dissipation.

Otherwise the period was of a quiet, formative sort, and the few stimulants to growth offered by Government overshot the town and fell to the agricultural grantees. The production of tobacco and myrtle-wax was encouraged, but it was also taxed. Through the Jesuit fathers, sugar-cane was introduced. But one boon eclipsed all the rest: year by year came the casket-girls, and were given in marriage to the soldiers chosen for good conduct, with a tract of land to begin life on. The last ship-load came ashore in 1751.

The most conspicuous attentions offered New Orleans were a prohibition against trading with the English and Dutch, and further inundations of paper money. The little port continued to grow, though pirates infested the Gulf, British privateers were sometimes at the very mouth of the river, seasons were adverse, and Indian allies insolent. It was reported with pride, that forty-five brick houses were erected between the autumns of 1749 and 1752.

Among the people a transmutation was going on. French fathers were moving aside to make room for Creole sons. The life of the seniors had been what the life of redemptionists and liberated convicts, combining with that of a French and Swiss line and staff in and about the outposts of such a frontier, might be: idle, thriftless, gallant, bold,

rude, free, and scornful of labor, which the company had brought into permanent contempt by the introduction of African slaves. In this atmosphere they had brought up their children. Now these children were taking their parents' places, and with Latin ductility were conforming to the mold of their nearest surroundings. They differed from their transatlantic stock much as the face of nature in Louisiana differed from that in France. A soil of unlimited fertility became, through slavery, not an incentive to industry, but a promise of unearned plenty. A luxurious and enervating climate joined its influence with this condition to debase even the Gallic love of pleasure to an unambitious apathy and an untrained sensuality. The courteous manners of France were largely retained; but the habit of commanding a dull and abject slave class, over which a "black code" gave every white man full powers of police, induced a certain fierce imperiousness of will and temper; while that proud love of freedom, so pervasive throughout the American wilderness, rose at times to an attitude of arrogant superiority over all constraint, and became the occasion of harsh comment in the reports sent to France by

the officers of their king. In the lakes, cane-brakes, and swamps, and on the bayou ridges, of their dark, wet forests, and on the sunny expanses of their marshes, a great abundance of bears, panthers, deer, swan, geese, and lesser game gave a bold zest to arduous sport. The chase became almost the only form of exertion, and woodcraft often the only education.

As for the gentler sex, catching less grossness from negro slavery and less rudeness from the wilderness, they were, in mind as well as morals, superior to the men. They could read and write and make a little music. Such French vivacity as still remained chose the ball-room as their chief delight, while the gaming-table was the indoor passion of the men. Unrestrained, proud, intrepid, self-reliant, rudely voluptuous, of a high intellectual order, yet uneducated, unreasoning, impulsive, and inflammable,—such was the first native-born generation of Franco-Louisianians.

## VII.

## THE FIRST CREOLES.

WHAT is a Creole? Even in Louisiana the question would be variously answered. The

title did not, here, first belong to the descendants of Spanish, but of French settlers. But such a meaning implied a certain excellence of origin, and so came early to include any native, of French or Spanish descent by either parent, whose non-alliance with the slave race entitled him to social rank. Later, the term was adopted by—not conceded to—the natives of mixed blood, and is still so used among themselves. At length the spirit of commerce saw the money-value of so honored a title, and broadened its meaning to take in any creature or thing of variety of manufacture peculiar to Louisiana that might become an object of sale: as Creole ponies, chickens, cows, shoes, eggs, wagons, baskets, cabbages, negroes, etc. Yet the Creoles proper will not share their distinction with the worthy "Acadian." He is a Creole only by courtesy, and in the second person singular. Besides French and Spanish, there are even, for convenience of speech, "colored" Creoles; but there are no Italian, or Sicilian, nor any English, Scotch, Irish, or "Yankee" Creoles, unless of parentage married into, and themselves thoroughly proselyted in, Creole society. Neither Spanish nor American domination has taken from the Creoles their French vernacular. This, also, is part of their title; and, in fine, there seems to be no more serviceable definition of the Creoles of Louisiana than this: that they are the French-speaking, native, ruling class.

There is no need to distinguish between the higher and humbler grades of those from whom they sprang. A few settlers, only, were persons of rank and station. Many were the children of the casket-girls, and many were of such stock as society pronounces less than nothing; yet, in view of that state of society which the French revolution later overturned, any present overplus of honor may as well fall to the children of those who filled the prisons before, as of those who filled them during that bloody convulsion.

In the days of De Vaudreuil, the dwellings of the better class that had stood at first on the immediate front of the town, or on the first street behind, seem to have drawn back a square or two. They were also spreading toward and out through a gate in the palisade wall near its north corner. Bayou Road, now a street of the city, issued from this gate northward to the village and bayou of St. John. Along this suburban way, surrounded by broad grounds, deeply shaded with live-oaks, magnolias, and other evergreen forest trees, and often having behind them plantations of indigo or myrtle, rose the wide, red-roofed, but severely plain frame dwellings of the rich, generally of one or one

and a half stories, but raised on pillars often fifteen feet from the ground, and surrounded by wide verandas.

In the lofty halls and spacious drawing-rooms of these homes—frequently, too, in the heart of the town, in the houses of the humblest exterior, their low, single-story wooden or brick walls rising from a ground but partly drained even of its storm water, infested with reptile life and frequently overflowed—was beginning to be shown a splendor of dress and personal adornment hardly in harmony with the rude simplicity of apartments and furniture and scarcely to be expected in a town of unpaved, unlighted, and often impassable streets, surrounded by swamps and morasses on one of the wildest of American frontiers.

Slaves—not always or generally the dull, ill-featured Congo or fierce Banbara, imported for the plantations, but comely Jalaff and Mandingo boys and girls, the shapelier for their scanty dress—waited on every caprice, whether good or ill. New Orleans had been the one colonized spot in the delta where slaves were few, but now they rapidly became numerous, and black domestic service made it easy for the Creoles to emulate the ostentatious living of the colonial officials.

To their bad example in living, these dignitaries, almost without exception, added that of corruption in office. Governors, royal commissaries, post-commandants,—the Marchioness de Vaudreuil conspicuously,—and many lesser ones, stood boldly accusing and accused of the grossest and the pettiest misdemeanors. Doubtless the corruption was exaggerated; yet the testimony is official, abundant, and corroborative, and is verified in the ruinous expenses which at length drove France to abandon the maintenance and sovereignty of the colony she had misgoverned for sixty-three years.

Meanwhile, public morals were debased; idleness and intemperance were general; speculation in the depreciated paper money which flooded the colony became the principal business, and insolvency the common condition.

Religion and education made poor headway. Almost the only item in their history is a "war of the Jesuits and Capuchins." Its "acrimonious writings, squibs, and pasquinades" made much heat for years. Its satirical songs were heard, it appears, in the drawing-rooms as well as in the street; for the fair sex took sides in it with lively zeal. In July, 1763, the Capuchins were left masters of the field. The decree of the French parliament had the year before ordered the Jesuits' expulsion from the realm; their wide plantations just beyond the town

OLD VILLA ON BAYOU ST. JOHN.

walls being desirable, the Creole "Superior Council" became bold, and the lands already described as the site of the richest district in the present New Orleans were confiscated and sold for \$180,000.

In this same year, a flag, not seen there before, began to appear in the yellow harbor of New Orleans. In February, a treaty between England, France, and Spain, gave Great Britain all that immense part of the Mississippi Valley east of the river and north of Orleans Island. The Delta remained to France and to her still vast province of Louisiana. The navigation of the Mississippi was made free to the subjects of both empires alike. Trade with British vessels was forbidden the French colonies; yet a lively commerce soon sprang up with them at a point just above the plantations of the dispossessed Jesuits, afterward the river front of the city of Lafayette, and now of the Fourth District of New Orleans. Here numerous trading vessels, sailing under the British flag, ascending the river and passing the town on the pretext of visiting the new British posts of Manchac and Baton Rouge, landed and carried on a commerce with the merchants of the post they had just passed by.

The corrupt authorities winked at a practice that brought wealth to all, and the getting of honest rights by disingenuous and

dishonest courses became the justified habit of the highest classes and the leading minds. The slave trade, too, received an unfortunate stimulus: a large business was done at this so-called "Little Manchac," in Guinea negroes, whom the colonists bought of the English.

The governor of Louisiana at this time was Kerlerec, a distinguished captain in the French navy. He had succeeded the Marquis in 1753, and had now governed the province for ten years. But he had lately received orders to return to France and render account of his conduct in office. A work of retrenchment was begun. The troops were reduced to three hundred. In June, a M. d'Abbadie landed in New Orleans, commissioned to succeed the governor under the shorn honors and semi-commercial title of director-general. Kerlerec, sailing to France, was cast into the Bastille and "died of grief shortly after his release."

The Creoles noted, with much agitation, these and other symptoms of some unrevealed design to alter their political condition. By and by, rumor of what had secretly been transacted began to reach their ears in the most offensive shape. Yet, for a time, M. d'Abbadie himself remained officially as uninformed as they; and it was only in October, 1764, twenty-three months after the signing of a secret act at Fontainebleau, that the

OLD CANAL ON DAUPHINE STREET. [A RESTORATION.]

authoritative announcement reached New Orleans of her cession, with all of French Louisiana, to the king of Spain.

Such is the origin, surrounding influences, and resulting character and life of the earliest Creoles of Louisiana. With many influences against them, they rose from a chaotic condition below the plane of social order to the station of a proud, freedom-loving, agricultural and commercial people, who, shortly after the date with which these chapters close, struck the first armed blow ever aimed by Americans against a royal decree.

Their descendants would be a community still more unique than they are, had they not the world-wide trait of a pride of ancestry. But they might as easily be excused for boasting of other things which they have overlooked. A pride of ascent would be as well grounded; and it will be pleasant if we are permitted to show in later papers that the decadence imputed to them, sometimes even by themselves, has no foundation in fact, but that their course, instead, has been, in the main, upward from first to last, and so continues to-day.

## THE TRIP OF THE "MARK TWAIN."

WESTERN travelers have declared that a voyage down the Mississippi is monotonous. To test the question fairly, one must have plenty of leisure for travel and in great measure that chief qualification of a traveler, good-humor. With a fair proportion of both, I found myself one day in Memphis, hunting for a steam-boat to take me "down below." The first step was neither dull nor unpicturesque, for it led to a view of the mighty river rushing out of a rosy haze in the north, and disappearing in a smoky mist below the town,—just as the hopes and capital of many a Northern man have disappeared in the great bewildering mist of Southern investment. It is sweet water, this, but muddy; so muddy, they say, that washing one's hands in it cleans it; yet it is sweet to taste. All along the bank lay numbers of vast structures, looking, with the forests above them, like the stupendous turtles of Japanese legend, overgrown with trees. These were the steam-boats; had I time I would give their names as Homer catalogues his heroes. There was the *Teuton*, as stanch, sturdy, and stout as though it were the typical ark of the German Noah; and the *De Soto*, deserving, for name's sake, to have a better fate than upset chimneys and buckled wheel. Which boat should

THE FIRST MATE.

I take? How was I to know the special merits of all these *Anchors*, *Telegraphs*, *Swans*, and the vast harem of *Belles* of all sorts, which remain ever true to the Father of Rivers? All at once I saw one which was as the sight of a familiar friend,—the *Mark Twain*, and at once I decided to take passage on it.

I was welcomed to its deck warmly—very warmly—by the first mate, a personage in a coon-skin cap, and a mantle lined, not with ermine, but with cat-skins. "Blank your blanked head, look

"WHICH BOAT? I DUNNO."

out, or the boom 'll hit ye; now, then, right along, right ahead, 'shove em along, up with blank blank, I'll blank your ——" etc., etc., etc., in one stream, without a pause, addressed to passengers, crew, loafers, the elements, and all things animate and inanimate, with such unstinted measure that the recipient is rather confused at first, if he has not been through the experience before. "Now, then, hurry out—Howdy, Sam?—Here, you nigga!—Gimme your ticket!—Now, Mr. Johnson—Just let me catch you with that broom in the waatter—Pick that up, will you?—Here, you sawed-off nigger——!" Having passed this Cerberus, I found the inside much more reassuring; Eastlake-ish furniture and much white paint are clean, at any rate, if not always comfortable and appropriate. I came on board to watch an hour before we steamed. A large amount of merchandise was deposited on the wharf, and the deck-hand "roustabouts," under the stimulus of the first mate, began to carry it aboard. Before long one of them began to sing in a low tone. The words, as near as I could catch them, were:

BILLY.

"I fink I hea' de preacher say  
 Oh how, how oh!  
 You never git to heben 'less you pray,  
 Oh how, how oh!  
 W'en Satan come into de room,  
 Oh how, how oh!  
 We'll bang him wid a hick'ry broom,  
 Oh how, how oh!  
 'Roun' de room we'll gib him chase,  
 Oh how, how oh!  
 And frow de kittle in he's face,  
 Oh how, how oh!  
 De w'ile temptation we defy,  
 Oh how, how oh!  
 Departure like a brimson fly,  
 Oh how —"

What this last simile means I know not. I noted it exactly as it was sung. There was a sudden interruption—an abrupt fall of voices, one or two quavering out "How—oh!" as if loth to quit—a rattling of casks, and then a clear baritone was uplifted with:

"Oh, Moses he strutch out he's rod,  
 Oh—o-o-oh de Red Sea.

And de Childern's Isr'el pass ober dry shod,  
 Oh, de R—e—d Sea.  
 An' Pharaoh come follerin' down  
 By de Re—c—d Sea.  
 Wid all de sojers in de town  
 By de R—e—d Sea!  
 An' dar de Lord confounded 'em  
 By de R—e—d Sea!  
 An' all de waters drowned 'em  
 In de Re—e—d Sea!  
 Dis de way dat folks begin  
 By de Re—e—d Sea,  
 An' dat's de way dey tumble in  
 In de R—e—d Sea!"

(Interloping improvisatore):

"Dis de way and dat's de style  
 By de R—e—d Sea!"

(Improvisatore No. II.):

"To git a drink dey'd run a mile,  
 By de R—e—d Sea!"

Night has already fallen as we clear the town. The ruddy light, as the furnace-doors are opened, brings out with startling force

the forms of the stokers on the open lower deck. A train of sparks, going like man's life from mystery to mystery, ascend with the smoke and follow in a long line, and, finally falling on the water, are extinguished. Back in the steerage, huddled over the stoves and with no other light, are the crew and the second-class passengers. At the small bar a motley crowd is singing and shouting. On the upper deck is the gentleman from *Arkinsaw* (as they call it here and as the State officially calls itself). The gentlemanly "drummer" and the usual number of nondescripts are having a friendly set-to at seven-up. Before long the whistle blows, and the electric light, now used on these boats to make the landing by, flashes over the water. It is even more picturesque, perhaps the more for being dangerous, when great torches consisting of cressets holding pine-knots, light the scene. The lurid, wind-flickered flames, the burning pitch dripping in alarming proximity to the tinder-like boat and the cotton-bales, with perhaps a procession of Old World emigrants, sitting in rows,—Norwegians, Germans, or Bohemians,—all form strange, quaint pictures, not to be forgotten for years. I cannot help dwelling, however, on the intensely dramatic effect of the more modern illumination. Imagine a pitch-dark night, during a freshet, when the water is far above its common level, roaring and rushing against unusual obstacles.

A CABIN PASSENGER.

Every condition is changed, and all tends to effect. The boat is steered toward some flickering lantern-lights, which look like will-o'-the-wisps over the water, when suddenly a sea of light, a gush of aerial fire is turned on, and out of the darkness at a touch come the jagged, ghostly forms of the cotton-woods, stretching out their long, bare arms toward us as if to grasp us like kraken; men are brought into startling and incredible relief against a dead-black ground. It is a peculiarity of the people here, as it is of the peasantry of Southern France, to stand perfectly motionless when gazing at passing railroad trains, or, as in this instance, at the steam-boats, and the stillness gives a strangely picturesque and unearthly effect to the scene.

For however short a time any place is one's home, he can make it more home-like by getting acquainted with some one. My first move in this direction was to a black roustabout or steam-boat hand, named Billy. You have his portrait; it is almost all there was of him, to believe his own account of himself.

"I's jist nobody," he said. "I's de most lone man dere is. I's got no fre'n's. Fo' de war I was a slabe, now I's free; but, as de preacher says, 'Whar's de use o' being free ef you's a slabe to yourse'f.'"

Here he paused, and stared as if he had made a point. I could not see it, but I shook my head, and said:

"Yes, indeed."

He resumed:

"When I got free from de ole missus, I fell in lub. Dat was only changin' one missus for anudder, and I was a wuss slabe dan befo'. An' I had it all to myse'f, like a coon on a prairie—de gal didn't want me. Den I tuck to wuckin' hard and become a slabe to money. And dere I was all alone

THE GENTLEMAN FROM ARKINSAW.

ONE FROM THE STEERAGE.

ag'in, fur nobody I knowed keered fur anything about me, 'cept to git my money fum me. Now I's a slabe to dis hyar steam-boat, an'——"

Here a peremptory summons to duty, in florid language, gives a perfect point to Billy's remarks.

But Billy mournful and Billy at work with the other stokers in the fire-room, are two different characters. What a picture! It is like a black furnace, like Etna with Vulcan and the Cyclops, where huge forms are moving from light into darkness, and

"Come like shadows, so depart."

Now the lonely slave appears to be the lively demon. And the alternate play of the fire-light and blackness is carried out in life by the contrast between the great activity of those awake and the slumbering forms which lie about the deck. Among these is, however, a knot of wakeful men, smoking and "swapping lies." These I join, and find them telling river-stories, and I come in time to hear the following:

"Yes, I was asleep in my state-room, and I was woke up by the most awful cries I ever heard in my life. There are all

kinds of awful cries. These were the biled-down sort, with agony peppered in. There was murder goin' on—that was as plain as lightnin'. First I heard a cry, 'Cut him down!—cut him!—down with him!' Then a row, and then, 'Now bring in another! Aye—give it to her!—hit her! Again!' I thought in an instant that the darkeys had mutinied and were killing the passengers. I listened again and was sure of it. I dared not enter the cabin. I climbed out of my state-room window—in my night-shirt—and hid behind some cotton-bales. But there came a swarming, yelling crowd, rushing that way—and I rose—jumped up—gave myself up for lost. But if I was badly scared, it was nothing to the scare I gave the darkeys. 'It's a spook!'—'Ghost!'—'Dat's an appearance!'—'Wah—wah!'—'Warra wah!' they shouted. But, to explain it all, they had only been getting some cotton-bales on board, and 'Hit him again' was only applied to King Cotton. Nowadays, if anybody asks me if I believe in ghosts, I paraphrase Sydney Smith and answer, 'Yes, I've been one.'

At each landing there is a bale or two of cotton to be put on board. The pilot runs the nose of the boat into the levee. They lower away the gang-plank, and forth rush the roustabouts, followed by the mate and the clerk with horrible cries; on comes the bale in a jiffy, and the boat is off again.

Sometimes, there is only a "collud gemplum" emigrating from one plantation to another, carrying his "lares and penates" in a bandana in one hand, and an antiquated stove-pipe hat and umbrella in the other; then the boat runs near the bank, the engineer slows down, the mate yells "Now then, you!" down comes the gangway to a level, and the "lone traveler" has to "walk the plank." As he nears the shore end, some one tips up the other end, and he loses his head, frantically grasps at nothing, and household gods, umbrella and he take a brief sail through the air, only to alight in the mud. Then the boat backs off and leaves him, and

WAITING FOR THE BOAT.

the passengers and crew bestow upon him much good advice, which has the usual effect.

The first mate of the vessel, he of the fur cap, was a character. It was appropriate to find him in the *Mark Twain*. He was bald and looked very old, but declared he was thirty.

"Ef you had been through what I hev, my travelin' stranger," quoth he, "you too would look like an example of the longest kind of long-gevity. My name figures prominently in history. I've been published in four hundred and thirty-nine newspapers and one almanac. I've been blown up by steamboats in twenty-two States and several territories. On most occasions, everybody on board perished except myself. Pieces of my skull is layin' round loose all up and down this river, and numerous of its tributarrys. Awful? Yes. Once I was aboard the *Obiona*. I knew we were goin' to bust that artemnoon, for it was about bustin' time with me, and

bust we did. When I come down I couldn't find nothin'. Everything had blowed to dust, or gone so fur that nothin' was within visible distance. But, bless you!—that's nothin'. Minor catasterfies? Oh, yes. Once we smashed a wheel against a snag. Of course when we progressed we went round and round, and so went round and round all the way down to New Orleans, describin' circles the whole time.

A LANDING FOR ONE.

We all got orful headaches owin' to the centripetal tendency of the periphery."

I begin to realize the penetration of the Romans when they said *nomen est omen*, that a name is a sign, for the very name of *Mark Twain* seems a spell to call up yarns. I could stock a library with the stories I heard on board that boat.

The journey was effected without accident,—all save one to a small man with a prominent nose, who distinguished himself by always being forward—nay, obtrusive, whenever there was any danger. He was more than indifferent to it,—he seemed to court it. At last he was qualified, for, while putting himself very much in the way, a cotton-bale rolled over him. I never saw any man so brave before an injury who seemed so weak after it. He yelled—wept—swore—and finally, seeing that I was friendly, asked me to write for him a testimonial that he had been hurt. This I did,

A ROUSTABOUT.

and, seeing that it would please him, I put it very strong. As soon as he had procured the precious document, with the names of witnesses appended, he seemed to be greatly relieved.

"Yesh—I feels mosh bedder," he said, "I feels *nicht mehr* so sick ash earlier. Dish comfort me. Mine life ish insured fur von tousand dollar for accidents. Dis hits him."

I do not believe that the famous Meander can entangle itself in such a fearful maze as the Mississippi has succeeded in getting into just above *Arkinsaw* City.

When about three miles in a straight line from this city (composed of a dozen or so palatial residences of planks), the knowing ones among the passengers got off and walked across the country, whiling away the intervening hour occupied by the steamer in going twelve or fifteen miles around.

If patience is a virtue, the dwellers upon the banks of this stream have this redeeming quality in large measure. They will sit patiently for hours in a dug-out or on the fence-corners, waiting for the boat, and then, just before she comes in sight, will accept an invitation to go back in the country a mile or two, to get a drink, and thus will be in good season for the next boat. "What's the use of bein' in a hurry. If I can get suthin' good, I goin' to get it. All *I* live for is to eat and drink," a prosperous individual told me; and he considered himself about the measure of a man. By the way, you see some fine specimens of physical manhood on the banks. I remember a man who came aboard one night from a small landing, dressed in blue jeans, but with a god-like form and face.

And so, amid a leisurely monotony which is relieved by oddities, we arrive in due time at New Orleans.

## THE RUDDER GRANGERS IN ENGLAND.

It was mainly due to Pomona that we went to Europe at all. For years Euphemia and I had been anxious to visit the enchanted lands on the other side of the Atlantic, but the obstacles had always been very great, and the matter had been indefinitely postponed. Pomona and Jonas were still living with us, and their little girl was about two years old. Pomona continued to read a great deal, but her husband's influence had diverted her mind toward works of history and travel, and these she devoured with eager interest. But she had not given up her old fancy for romance. Nearly everything she read was mingled in her mind with Middle Age legends and tales of strange adventure. Euphemia's frequent reference to a trip to Europe had fired Pomona's mind, and she was now more wildly anxious for the journey than any of us. She believed that it would entirely free Jonas from the chills and fever that still seemed to permeate his being. And besides this, what unutterable joy to tread the sounding pavements of those old castles of which she had so often read! Pomona further perceived that my mental and physical systems required the rest and change of scene which could be given only by a trip to Europe. When this impression had been produced upon Euphemia's mind the matter, to all intents and purposes, was settled. A tenant, who I suspect was discovered and urged forward by the indefatigable Pomona, made an application for a year's lease of our house and farm. In a business view I found I could make the journey profitable, and there seemed to be no reason why we should not go, and go now.

It appeared to be accepted as a foregone conclusion by Euphemia and Pomona that the latter, with her husband and child, should accompany us; but of this I could not, at first, see the propriety.

"We will not want servants on a trip like that," I said; "and although I like Jonas and Pomona very much, they are not exactly the people I should prefer as traveling companions."

"If you think you are going to leave Pomona behind," said Euphemia, "you are vastly mistaken. Oceans and continents are free to her, and she will follow us at a distance if we don't let her go with us. She is just one tingle from head to foot to go to Europe. We have talked the whole thing over, and I know that she will be of the greatest possible

use and comfort to me in ever so many ways; and Jonas will be needed to take care of the baby. Jonas has money, and they will pay a great part of their own expenses, and won't cost us much, and you needn't be afraid that Pomona will make us ashamed of ourselves, if we happen to be talking to the Dean of Westminster or the Archbishop of Canterbury, by pushing herself into the conversation.

"Indeed," said I, "if we ever happen to be inveigled into a confab with those dignitaries I hope Pomona will come to the front and take my place."

The only person not entirely satisfied with the proposed journey was Jonas.

"I don't like traipsin' round," said he, "from place to place, and never did. If I could go to some one spot and stay there with the child, while the rest of you made trips wherever you wanted to go to, I'd be satisfied, but I don't like keepin' on the steady go."

This plan was duly considered, and the suitability of certain points was discussed. London was not believed sufficiently accessible for frequent return trips, Paris could scarcely be called very central; Naples would not be suitable at all times of the year, and Cairo was a little too far eastward. A number of minor places were suggested, but Jonas announced that he had thought of a capital location, and being eagerly asked to name it, he mentioned Newark, New Jersey.

"I'd feel at home there," he said, "and it's about as central as any place, when you come to look on the map."

But he was not allowed to remain in his beloved New Jersey, and we took him with us to Europe.

We did not, like the rest of the passengers on the steamer, go directly from Liverpool to London, but stopped for a couple of days in the quaint old town of Chester. "If we don't see it now," said Euphemia, "we never shall see it. When we once start back we will all be raving distracted to get home, and I wouldn't miss Chester for anything."

"There is an old wall there," said the enthusiastic Pomona to her husband, "built by Julius Cæsar before the Romans became Catholics, that you kin walk on all round the town; an' a tower on it which the king of England stood on to see his army defeated, though of course it wasn't put up for that purpose; besides, more old-time-ities which the book tells of than we can see in a week."

"I hope," said Jonas, wearily shifting the

child from one arm to the other, "that there'll be some good place there to sit down."

When we reached Chester, we went directly to the inn called "The Gentle Boar," which was selected by Euphemia entirely on account of its name, and we found it truly a quaint and cozy little house. Everything was early English and delightful. The coffee-rooms, the bar-maids, the funny little apartments, the old furniture, and "a general air of the Elizabethan era," as Euphemia remarked.

"I should almost call it Henryan," said Pomona, gazing about her in rapt wonderment.

We soon set out on our expeditions of sight-seeing, but we did not keep together. Euphemia and I made our way to the old cathedral. The ancient verger who took us about the edifice was obliged to show us everything, Euphemia being especially anxious to see the stall in the choir which had belonged to Charles Kingsley, and was much disturbed to find that under the seat the monks of the fifteenth century had carved the subject of one of Baron Munchausen's most improbable tales.

"Of course," said she, "they did not know that Charles Kingsley was to have this stall, or they would have cut something more appropriate."

"Those old monks 'ad a good deal of fun in them," said the verger, "hand they were particular fond of showing up quarrels between men and their wives, which they could do, you see, without 'urting each-other's feelings. These queer carvings are hunder the seats, which turn hup in this way, and I've no doubt they looked at them most of the time they were kneeling on the cold floor saying their long, Latin prayers."

"Yes, indeed!" said Euphemia. "It must have been a great comfort to the poor fellows."

"We went all through that cathedral," exclaimed Pomona, when she came in the next day. "The old virgin took us everywhere."

"Verger," exclaimed Euphemia.

"Well, he looked so like a woman in his long gown," said Pomona, "I don't wonder I mixed him. We put two shillin's in his little box, though one was enough, as I told Jonas, and then he took us round and pointed out all the beautiful carvin's and things on the choir, the transits, and the nave, but when Jonas stopped before the carved figger of the devil chawin' up a sinner, and asked if that was the transit of a knave, the old feller didn't know what he meant. An' then we wandered alone through them ruined cloisters and subterranean halls, an' old tombstones of the past, till I felt I don't know how. There was a girl in New Jersey who used to put on airs because her family had

lived in one place for a hundred years. When I git back I'll laugh that girl to scorn."

After two days of delight in this quaint old town we took the train Londonward. Without consultation Jonas bought tickets for himself and wife, while I bought Euphemia's and mine. Consequently our servants traveled first-class, while we went in a second-class carriage. We were all greatly charmed with the beautiful garden country through which we passed. It was harvest time, and Jonas was much impressed by the large crops gathered from the little fields.

"I might try to do something of that kind when I go back," he afterward said, "but I expect I'd have to dig a little hole for each grain of wheat, and hoe it, and water it, and tie the blade to a stick if it was weakly."

"An' a nice easy time you'd have of it," said Pomona, "for you might plant your wheat field round a stump, and set there, and farm all summer, without once gittin' up."

"And that is Windsor!" exclaimed Euphemia, as we passed within view of that royal castle. "And there lives the sovereign of our Mother Country!"

I was trying to puzzle out in what relationship to the Sovereign this put us, when Euphemia continued:

"I am bound to go to Windsor Castle! I have examined into every style of housekeeping, French flats and everything, and I must see how the Queen lives. I expect to get ever so many ideas."

"All right," said I; "and we will visit the royal stables, too, for I intend to get a new buggy when we get back."

We determined that on reaching London we would go directly to lodgings, not only because this was a more economical way of living, but because it was the way in which many of Euphemia's favorite heroes and heroines had lived in London.

"I want to keep house," she said, "in the same way that Charles and Mary Lamb did. We will toast a bit of muffin or a potted sprat, and we'll have a hamper of cheese and a tankard of ale, just like those old English poets and writers."

"I think you are wrong about the hamper of cheese," I said. "It couldn't have been as much as that, but I have no doubt we'll have a jolly time."

We got into a four-wheeled cab, Jonas on the seat with the driver, and the luggage on top. I gave the man a card with the address of the house to which we had been recommended. There was a number, the name of a street, the name of a place, the name of a square, and initials denoting the quarter of the town.

"It will confuse the poor man dreadfully," said Euphemia. "It would have been a great deal better just to have said where the house was."

The man, however, drove to the given address without mistake, but the house, alas! was full. The landlady directed us to another, nearly opposite, on which there was a bill. I went over there, followed by the cab, but found no accommodations.

"There's plenty o' lodgin's, sir," said the cabman. "There's a bill up in nigh hev'ry 'ouse 'ere."

And so, followed by the cab, my party, and my luggage, I went in turn to several houses, and, at last, found one which offered us the accommodations we needed. The house presented a good appearance in front, yet was, in reality, very small, but as there were no other lodgers there was room enough for us. Euphemia was much pleased with the establishment. The house was very well furnished, and she had expected to find things old and stuffy, as London lodgings always were in the books she had read.

"But if the landlady will only steal our tea," she said, "it will make it seem more like the real thing."

As we intended to stay some time in London, where I had business to transact for the firm with which I was engaged, we immediately began to make ourselves as much at home as possible. Pomona, assisted by Jonas, undertook at once the work of the house. To this the landlady, who kept a small servant, somewhat objected, as it had been her custom to attend to the wants of her lodgers.

"But what's the good of Jonas an' me being here," said Pomona to us, "if we don't do the work? Of course if there was other lodgers that would be different, but as there's only our own family, where's the good of that woman and her girl doin' anything?"

And so, as a sort of excuse for her being in Europe, she began to get the table ready for supper, and sent Jonas out to see if there was any place where he could buy provisions. Euphemia and I were not at all certain that the good woman of the house would be satisfied with this state of things; but still, as Jonas and Pomona were really our servants, it seemed quite proper that they should do our work. And so we did not interfere, although Euphemia found it quite sad, she said, to see the landlady standing idly about, gazing solemnly upon Pomona as she dashed from place to place engaged with her household duties.

After we had been in the house for two or three days, Pomona came into our sitting-room one evening and made a short speech.

"I've settled matters with the woman here,"

she said, "an' I think you'll like the way I've done it. I couldn't stand her follerin' me about, an' sayin' 'ow they did things in Hingland while her red-faced girl was a-spendin' the days on the airy steps, a-lookin' through the railin's. 'Now, Mrs. Bowlin',' says I, 'it'll just be the ruin of you an' the death of me if you keep on makin' a picter of yourself like that lonely Indian a-sittin' on a pinnacle in the jographys, watchin' the inroads of civilization, with a locomotive an' a cog-wheel in front, an' the buffalo an' the grisly a-disappearin' in the distance. Now it'll be much better for all of us,' says I, 'if you'll git down from your peak, and try to make up your mind that the world has got to move. Aint there some place where you kin go an' be quiet an' comfortable, an' not a-woundin' your proud spirit a-watchin' me bake hot rolls for breakfast an' sich?' An' then she says she'd begun to think pretty much that way herself, an' that she had a sister a-livin' down in the Sussex Mews, back of Gresham Terrace, Camberwell Square, Hankberry Place, N. W. by N., an' she thought she might as well go there an' stay while we was here. An' so I says that was just the thing, and the sooner done the happier she'd be. An' I went up-stairs and helped her pack her trunk, which is a tin one, which she calls her box, an' I got her a cab, an' she's gone."

"What!" I cried, "gone! Has she given up her house entirely to us?"

"For the time bein' she has," answered Pomona, "for she saw very well it was better thus, an' she's comin' every week to git her money, an' to see when we're goin' to give notice. An' the small girl has been sent back to the country."

It was impossible for Euphemia and myself to countenance this outrageous piece of eviction; but in answer to our exclamations of surprise and reproach, Pomona merely remarked that she had done it for the woman's own good, and, as she was perfectly satisfied, she didn't suppose there was any harm done; and, at any rate, it would be "lots nicer" for us. And then she asked Euphemia what she was going to have for breakfast the next morning, so that Jonas could go out to the different mongers and get the things.

"Now," said Euphemia, when Pomona had gone down-stairs, "I really feel as if I had a foothold on British soil. It don't seem as if it was quite right, but it is perfectly splendid."

And so it was. From that moment we set up an English Rudder Grange in the establishment which Pomona had thus rudely wrenched, as it were, from the claws of the British Lion. We endeavored to live as far as possible in the English style, because, as

Euphemia said, we ought to try the manners and customs of every country. We had tea for breakfast and ale for luncheon, and we ate shrimps, prawns, sprats, saveloys, and Yarmouth bloaters. We took in the "Times," and, to a certain extent, we endeavored to cultivate the broad vowels. Some of these things we did not like, but we felt bound to allow them a fair trial.

We did not give ourselves up to sight-seeing as we had done at Chester, because now there was plenty of time to see London at our leisure. In the mornings I attended to my business, and in the afternoons Euphemia and I generally went out to visit some of the lions of the grand old city.

Pomona and Jonas also went out whenever a time could be conveniently arranged, which was done nearly every day, for Euphemia was anxious they should see everything. They almost always took their child, and to this Euphemia frequently objected.

"What's the good," she said, "of carrying a baby not two years old to the Tower of London, the British Museum, and the Chapel of Henry VII.? She can't take any interest in the smothered princes, or the Assyrian remnants."

"But you see, ma'am," said Pomona, "we don't expect the baby'll ever come over here ag'in, an' when she gits older, I'll tell her all about these things, an' it'll expan' her intellect a lot more when she feels she's seed 'em all without knowin' it. To be sure the monnyments of bygone days don't always agree with her; for Jone set her down on the tomb of Chaucer the other day, an' her little legs got as cold as the tomb itself, an' I told him that there was too big a difference between a tomb nigh four hundred years old an' a small baby which don't date back two years, for them to be sot together that way; an' he promised to be more careful after that. He gouged a little piece out of Chaucer's tomb, an' as we went home we bought a copy of the old gentleman's poems, so as we could see what reason there was for keepin' him so long, an' at night I read Jone two of the Canterbury Tales. 'You wouldn't 'a' thought, says Jone, 'jus' by lookin' at that little piece of plaster, that the old fellow could 'a' got up such stories as them.'"

"What I want to see more'n anything else," said Pomona to us one day, "is a real lord, or some kind of nobleman of high degree. I've allers loved to read about 'em in books, and I'd rather see one close to, than all the tombs and crypts and lofty domes you could rake together; an' I don't want to see 'em neither in the streets, nor yet in a House of Parliament, which aint in session; for there, I don't

believe, dressin' in common clothes as they do, that I could tell 'em from other people. What I want is to penetrate into the home of one of 'em, and see him as he really is. It's only there that his noble blood 'll come out."

"Pomona," cried Euphemia in accents of alarm, "don't you try penetrating into any nobleman's home. You will get yourself into trouble, and the rest of us too."

"Oh, I'm not a-goin' to git you into any trouble," said Pomona; "you needn't be afear'd of that." And she went about her household duties.

A few days after this, as Euphemia and I were going to the Tower of London in a Hansom cab—and it was one of Euphemia's greatest delights to be bowled over the smooth London pavements in one of these vehicles, with the driver out of sight, and the horse in front of us just as if we were driving ourselves, only without any of the trouble, and on every corner one of the names of the streets we had read about in Dickens and Thackeray, and with the Sampson Brasses, and the Pecksniffs, and the Mrs. Gamps, and the Guppys, and the Sir Leicester Dedlocks, and the Becky Sharps, and the Pendennis, all walking about just as natural as in the novels—it was then that we saw Pomona hurrying along the sidewalk alone. The moment our eyes fell upon her a feeling of alarm arose within us. Where was she going with such an intent purpose in her face, and without Jonas? She was walking westward and we to the east. At Euphemia's request I stopped the cab, jumped out, and ran after her, but she had disappeared in the crowd.

"She is up to mischief," said Euphemia.

But it was of no use to worry our minds on the subject, and we soon forgot, in the ancient wonders of the Tower, the probable eccentricities of our modern handmaid.

We returned; night came on; but Pomona was still absent. Jonas did not know where she was, and was very much troubled; and the baby, which had been so skillfully kept in the background by its mother that, so far, it had never annoyed us at all, now began to cry, and would not be comforted. Euphemia, with the assistance of Jonas, prepared the evening meal, and when we had nearly eaten it, Pomona came home. Euphemia asked no questions, although she was burning with curiosity to know where Pomona had been, considering that it was that young woman's duty to inform her without being asked.

When Pomona came in to clear the table, she acted as if she expected to be questioned, and was perfectly willing to answer, but Euphemia stood upon her dignity, and said nothing. At last Pomona could endure it no

longer, and stopping short, with the tablecloth in one hand and a tray in the other, she exclaimed:

"I'm sorry I made you help git the dinner, ma'am, and I wouldn't 'a' done it for anything, but the fact is I've been to see a lord, an' was kep' late."

"What!" cried Euphemia, springing to her feet, "you don't mean that!"

And I was so amazed that I sat and looked at Pomona without saying a word.

"Yes," cried Pomona, her eyes sparkling with excitement, "I've seen a lord, and trod his floors, and I'll tell you all about it. You know I was boun' to do it, and I wanted to go alone, for if Jone was with me he'd be sure to put in some of his queer sayin's an' ten to one hurt the man's feelin's, and cut off the interview. An' as Jone said this afternoon he felt tired, with some small creeps in his back, an' didn't care to go out, I knew my time had come, and said I'd go for a walk. Day before yesterday I went up to a policeman an' I asked him if he could tell me if a lord, or a earl, or a duke lived anywhere near here. First he took me for crazy, an' then he began to ask questions which he thought was funny, but I kep' stiff to the mark, an' I made him tell me where a lord did live,—about five blocks from here. So I fixed things all ready an' to-day I went there."

"You didn't have the assurance to suppose he'd see you," cried Euphemia.

"No, indeed, I hadn't," said Pomona, "at least under common circumstances. You may be sure I racked my brains enough to know what I should do to meet him face to face. It wouldn't do to go in the common way, such as ringin' at the frent-door and askin' for him, an' then offerin' to sell him furniter-polish for his pianner-legs. I knowed well enough that any errand like that would only bring me face to face with his bailiff, or his master of hounds, or something of that kind. So, at last, I got a plan of my own, an' I goes up the steps and rings the bell, an' when the flunkey, with more of an air of gen'ral upliftedness about him than any one I'd seen yit, excep' Nelson on top of his pillar, opened the door an' looked at me, I asked him,

"Is Earl Cobden in?"

"At this the man opened his eyes, an' remarked:

"What uv it if he is?"

"Then I answers, firmly:

"If he's in, I want yer to take him this letter, an' I'll wait here."

"You don't mean to say," cried Euphemia, "that you wrote the earl a letter?"

"Yes, I did," continued Pomona, "and at first the man didn't seem inclined to take it.

But I held it out so steady that he took it an' put it on a little tray, whether nickel-plated or silver I couldn't make out, and carried it up the widest and splendidest pair o' stairs that I ever see in a house jus' intended to be lived in. When he got to the fust landin' he met a gentleman, and give him the letter. When I saw this I was took aback, for I thought it was his lordship a-comin' down, an' I didn't want to have no interview with a earl at his front door. But the second glance I took at him showed me that it wasn't him. He opened it, notwithstanding, an' read it all through from beginnin' to end. When he had done it he looked down at me, and then he went back up-stairs a-follered by the flunk, which last pretty soon came down ag'in an' told me I was to go up. I don't think I ever felt so much like a wringed-out dish-cloth as I did when I went up them palatial stairs. But I tried to think of things that would prop me up. Pr'aps, I thought, my ancient ancestors came to this land with his'n; who knows? An' I might a been switched off on some female line, an' so lost the name an' estates. At any rate, be brave! With such thoughts as these I tried to stiffen my legs, figgeratively speakin'. We went through two or three rooms (I hadn't time to count 'em) an' then I was showed into the lofty presence of the earl. He was standin' by the fire-place, an' the minnit my eyes lit upon him I knowed it was him."

"Why, how was that?" cried Euphemia and myself, almost in the same breath.

"I knowed him by his wax figger," continued Pomona, "which Jone and I see at Madame Tussaud's wax-works. They've got all the head people of these days there now, as well as the old kings and the pizeners. The clothes wasn't exactly the same, though very good on each, an' there was more of an air of shortenin' of the spine in the wax figger than in the other one. But the likeness was awful strikin'.

"Well, my good woman," says he, a-holdin' my open letter in his hand, 'so you want to see a lord, do you?'"

"What on earth did you write to him?" exclaimed Euphemia. "You mustn't go on a bit further until you have told what was in your letter."

"Well," said Pomona, "as near as I can remember, it was like this: '*William, Lord Cobden, Earl of Sorsetshire an' Derry. Dear Sir. Bein' brought up under Republican institutions, in the land of the free—*' I left out '*the home of the brave*' because there wasn't no use crowin' about that jus' then—'*I haven't had no opportunity of meetin' with a individual of lordly blood. Ever since I was*

*a small girl takin' books from the circulatin' libery, an' obliged to read out loud with divided sillerbles, I've drank in every word of the tales of lords and other nobles of high degree, that the little shops where I gen'rally got my books, an' some with the pages out at the most excitin' parts, contained. An' so I asks you now, Sir Lord—* I did put humbly, but I scratched that out, bein' an American woman—*'to do me the favor of a short audience. Then, when I reads about noble earls an' dukes in their brilliant lit halls an' castles, or mounted on their champin' chargers, a-leadin' their trusty hordes to victory amid the glitterin' minarets of fame, I'll know what they looks like.'* An' then I signed my name."

"Yes, sir," says I, in answer to his earlship's question," said Pomona, taking up her story, "'I did want to see one, upon my word.'

"An' now that you have seen him,' says she, 'what do you think of him?'

"Now, I had made up my mind before I entered this ducal pile, or put my foot on one ancestral stone, that I'd be square and honest through the whole business, and not try to come no counterfeit presentiments over the earl. So I says to him,

"The fust thing I thinks is, that you've got on the nicest suit of clothes that I've ever seed yit, not bein' exactly Sunday clothes, and yit fit for company, an' if money can buy 'em—an' men's clothes is cheap enough here, dear only knows—I'm goin' to have a suit jus' like it for Jone, my husband.' It was a kind o' brown mixed stuff, with a little spot of red in it here an' there, an' was about as gay for plain goods, an' as plain for gay goods as anythin' could be, an' 'twas easy enough to see that it was all wool. 'Of course,' says I, 'Jone'll have his coat made different in front, for single-breasted, an' a buttonin' so high up is a'most too stylish for him, 'specially as fashions 'ud change afore the coat was wore out. But I needn't bother your earlship about that.'

"An' so,' says he, an' I imagine I see an air of sadness steal over his features, 'it's my clothes, after all, that interest you?'

"Oh, no,' says I, 'I mention them because they come up fust. There is, no doubt, qualities of mind and body —'

"Well, we wont go into that,' said his earlship, 'an' I want to ask you a question. I suppose you represent the middle class in your country?'

"I don't know 'xactly where society splits with us,' says I, 'but I guess I'm somewhere nigh the crack.'

"Now don't you really believe,' says he, 'that you and the people of your class would be happier, an' feel safer, politically speakin' if they had among 'em a aristocracy to which

they could look up to in times of trouble, as their nat'ral born gardeens? I ask yer this because I want to know for myself what are the reel sentiments of yer people.'

"Well, sir,' says I, 'when your work is done, an' your kitchen cleaned up, an' your lamp lit, a lord or a duke is jus' tip-top to read about, if the type aint too fine an' the paper mean beside, which it often is in the ten cent books; but, further than this, I must say, we aint got no use for 'em.' At that he kind o' steps back, and looks as if he was goin' to say somethin', but I puts in quick: 'But you mustn't think, my earl,' says I, 'that we undervallers you. When we remembers the field of Agincourt; and Chevy Chase; an' the Tower of London, with the block on which three lords was be-headed, with the very cuts in it which the headsman made when he chopped 'em off, as well as two crooked ones a-showin' his bad licks, which little did he think history would preserve forever; an' the old Guildhall, where down in the ancient crypt is a hangin' our Declaration of Independance along with the Roman pots an' kittles dug up in London streets; we can't forgit that if it hadn't a been for your old ancestral lines as roots, we'd never been the flourishin' tree we is.'

"Well,' said his earlship, when I'd got through, an' he kind o' looked as if he didn't know whether to laugh or not, 'if you represent the feelin's of your class in your country, I reckon they're not just ready for a aristocracy yit.'

"An' with that he give me a little nod, an' walked off into another room. It was pretty plain from this that the interview was brought to a close, an' so I come away. The flunk was all ready to show me out, an' he did it so expeditious, though quite polite, that I didn't git no chance to take a good look at the furniter and carpets, which I'd 'a' liked to have done. An' so I've talked to a real earl, an' if not in his ancestral pile at any rate in the gorgeousest house I ever see. An' the brilliantest dream of my youth has come true."

When she had finished I rose and looked upon her.

"Pomona," said I, "we may yet visit many foreign countries. We may see kings, queens, dukes, counts, sheikhs, beys, sultans, khedives, pashas, rajahs, and I don't know what potentates besides, and I wish to say just this one thing to you. If you don't want to get yourself and us into some dreadful scrape, and perhaps bring our journeys to a sudden close, you must put a curb on your longing for communing with beings of noble blood."

"That's true, sir," said Pomona thoughtfully, "an' I made a pretty close shave of it this time, for when I was talkin' to the earl, I was just on the p'int of tellin' him that I had such a high opinion of his kind o' folks that I once named a big black dog after one of 'em, but I jus' remembered in time, an' slipped on to somethin' else. But

I trembled worse than a pea-nut woman with a hackman goin' round the corner to ketch a train an' his hubs just grazin' the legs of her stand. An' so I promise you, sir, that I'll put my heel on all hankerin' after potentates. And so she made her promise. And, knowing Pomona, I felt sure that she would keep it—if she could.

*Frank R. Stockton.*

### A WOMAN'S REASON.

I HAVE a reason now for all I do,  
A reason that's so sweet, so old, so new,—  
Well, if you were not quite so near to-day  
Or if you'd turn your eyes another way—  
And while I let my hand a moment rest  
With clinging touch yet light upon your breast  
I might pretend that it was half a jest,  
I think perhaps—I'd tell you.

'Tis this.—No, turn your eyes another way!  
'Tis easier so when what one has to say  
Is half pretense—yet somehow makes one's heart  
Stir in one's side, with such a soft, quick start,  
'Tis this—the old World has been born again,  
Born with a strange, sweet, bitter throe of pain,  
The sad old World I treated with disdain  
Is new because—I love you!

In time gone by did seasons come and go?  
And was there summer rain and winter snow?  
Perhaps! What matter? Now the violet's blue  
The rose blooms red—and friends are tried and true,  
The blossoms on the boughs are white in Spring,  
The wind is soft, the birds spread joyous wing,  
And soar and wheel in the blue sky—and sing,  
Because—because—I love you.

I scarcely know my own face in the glass,  
It almost seems to mock me as I pass,  
Once of its few poor beauties I was vain  
Now they can only rouse me to disdain,  
I should be twenty thousand times as fair,  
The stars and sun should light my eyes and hair—  
And yet—sometimes I think I only care,  
Because—because—I love you.

I am so changeful and so full of mood,  
Sometimes I would not—and sometimes—I would,  
I'm proud and humble, scornful, thoughtful, light,  
A hundred times between the morn and night,  
I cast you off—I try to draw you near,  
I hold you lightly—and I hold you dear,  
And all the time I know with joy, with fear  
It is—because—I love you!

Will you remember this when I seem cold?  
When what I yearn to tell is all untold—  
When I am wayward, willful, silent, proud,  
When if I dared to think my thoughts aloud

They would repeat my jesting—of to-day.  
 "A woman's reason—and a woman's way,  
 It is—because—I love you!"

There is a reason now for Life and Death,  
 A reason why one's heart beats and one's breath  
 Comes quicker at the light touch of a hand,  
 My reason makes it summer in the land,  
 Once from all pain I longed all earth to free,  
 But now there is a reason Pain should be,  
 Since some day I might bear it patiently  
 Because—because—I love you.

And now—my hand clings closer to your breast,  
 Bend your head lower while I say the rest,  
 The greatest change of all is this—that I  
 Who used to be so cold, so fierce, so shy,  
 In the sweet moment that I feel you near,  
 Forget to be ashamed, and know no fear,  
 Forget that Life is sad and Death is drear,  
 Because—because—I love you!

*Frances Hodgson Burnett.*

#### DESOLATION.

EACH night I at my cottage casement stay,  
 To hear the moaning waters of the Deep  
 Sound through the wind that doth complaining sweep  
 O'er sea and land, upon its wand'ring way.  
 There doth my sorrow, hidden all the day,  
 Come forth to bid me look on it and weep;  
 The trees near by their wailing vigil keep,  
 And I, lamenting with great nature, say  
 To this my heart, which throbs with bitter pain,—  
 O heart, with moaning ocean make thy moan,  
 And sob thy grief unto the sobbing wind!  
 Mourn for lost love. How canst thou love again?  
 Mourn thou thy life. How wilt thou live so lone?  
 Mourn love and life, since life leaves love behind!

*E. C. White.*

#### FARMING FOR FEATHERS.

LOOKING over the primitive brush fence of a South African ostrich camp, and watching these majestic birds so long supposed to be untamable, as they come obedient to the call of the farmer and pick the grain from his hand, one cannot help thinking on what slender threads the prosperity of a nation may hang. For here is a land on which Providence has bestowed vast wealth by means of a trifle light as air, even an ostrich feather!

The ostrich seems to have been known and valued for its feathers from the earliest antiquity. A graphic account of the bird, with special allusion to its feathers, is found in the oldest book in the Bible, the book of Job.

Representations of it have been discovered in the ruins of Theban temples contemporary with Moses. The feathers appear as decorations for robes in the days of Nimrod. Very ancient specimens of the eggs still exist in Chinese and Persian temples, but no hint occurs anywhere that the bird was ever domesticated for purposes of trade. Some reckon the ostrich a very stupid creature, but that the bird should be known and its feathers valued all these ages, and yet no attempt be made to tame it, seems to argue commercial obtuseness, at least, on the part of man.

The first serious proposition with reference

to ostrich farming was made by the late Mr. Kinnear, of Beaufort West, in a letter to the "Cape Argus"; but although he demonstrated the profits of the trade, its practicability did not strike the Cape farmers very forcibly. It was not till about 1862 that the business reached an experimental stage, and in 1865 the government returns showed only eighty tame birds in the colony. During the succeeding ten years, however, the industry became a mania, till in 1875 there were not less than fifty thousand tame ostriches, and since then the number in the Cape has more than doubled, and the business has spread into the Free State, the Transvaal, and Natal. The export of feathers, which in 1875 was worth £400,000, has amounted for the past three years to £1,000,000 per annum.

I will give a brief sketch of the main stages of an ostrich's life. The period of incubation is now ascertained to be forty-two days, or exactly twice that of an ordinary hen. The

THE INCUBATOR.

size and the weight of the eggs do not bear a like proportion, for an ostrich egg is from five to six inches through the long diameter, and four to five inches through the short; and the weight is between three and four pounds. An ordinary ostrich egg is alleged to contain as much meat as twenty-four hen's eggs. The shells of some eggs are about one-sixteenth of an inch thick, and very strong, while others are thin and crack easily; some are thickly pitted, others as smooth as polished ivory. In the process of artificial incubation, which is largely adopted in breeding ostriches, the young chick can be distinctly heard to breathe in its shell about the fortieth or forty-first day. Its kicking and tapping at the shell may also be heard, and its movements perceived (as in the case of hen's eggs) by placing the egg on a table. On finding its way out of the shell—in which it sometimes requires help—the chick sits down on its haunches, and stares about the earth and up

at the sky, as much as to say, "What does it all mean?" And although it soon begins to hobble about a little, at least two days must elapse before it seems to get any definite idea of the connection of things. About the third day it seems to feel the need of food, and picks up bits of its own shell, perhaps, or pebbles, or coarse sand. With this preparation for the work of its young gizzard it swallows bits of grass or tiny insects, until it is able to grapple with lizards and larger reptiles. In the course of a few days the ostrich chick appears quite as large as an ordinary hen, but it is infinitely prettier. Its lovely eyes, deep, dark, and soft; its shapely bill; its broad, intelligent crown and beautiful neck, both of a rich brown or "bay," elegantly mottled or striped with black; and its close thick coat of brownish yellow down, hid upon the back and sides with black, white, and brown spangles of porcupine-like quills, give it a unique appearance among chickens. At the end of a week or two it becomes necessary to remove it from the mother—otherwise it would become very shy and wild—and it is now given over to the care of its keeper, who is commonly called a "herd" boy. The young bird is now fed upon lucerne, or other grass, with a plentiful supply of "mealies" (Indian corn). It grows rapidly, and at the end of a month may be as big as a large turkey. The down is now beginning to grow into rudimentary feathers, which gradually turn to a more decided gray. At six months the feathers and porcupine quills on the back have nearly all disappeared; while the neck, now grown long and more slender in proportion, has nearly lost its beautiful dapples and stripes, which are replaced by an ugly gray down. Its head may now reach the height of an average man. In another six months its neck is uniformly gray, with down thin and hairy; the feathers are then perfect and fit to be clipped. If the bird be a female its plumage will have assumed a dark gray, the tips of the white feathers visible at the end of the wing, and some extending out of the gray feathers of the tail: if a male, his feathers—except the whites on the wing and tail—are black. There are a few cases in the Cape of cock ostriches being white or a light gray, but these are not cases of old age, as some have supposed, but merely an accident of birth or a freak of nature. Contrary to the idea conveyed by most pictures, only a comparatively small tip of these white plumes appears to view unless the bird throws out his wings. The birds are often adults in size at this age, but it is not till they have reached from two and a half to four years that the pairing instinct has fully developed. The male bird's body

will then stand as high as a man's head, the female's about as high, though it is not so bulky; while their heads may reach from nine to ten feet above the ground.

A year or two ago an average chicken just out of the shell was worth five pounds; at a month old seven pounds; at six months old fifteen or twenty pounds; at a year twenty-five or thirty pounds; at two years fifty pounds or more; and, by the time they had begun to prove their breeding qualities, they would bring from seventy-five to as high as one thousand pounds a pair. Now an excellent pair of breeding birds can be got for twenty-five pounds, and young birds in proportion. Pairing may begin at any time of the year, and varies in different places. Although the ostrich ordinarily breeds twice a year, yet where artificial incubation is adopted and the bird is not exhausted with the care of rearing, three or four broods can be had in a year. The grown bird's food consists chiefly of "mealies" or other grain, grass, and the great fleshy leaves of the prickly pear. The latter is a very common food, as it grows wild and only costs the trouble of gathering it, of singeing the prickles off in a fire, and of chopping it into pieces an inch or two square. The average duration of an ostrich's life is still a mystery, and it may take some years of ostrich-farming before it is solved. Some farmers, considering the period from chickenhood to full development as bearing analogy with domestic fowls, place the life of an ostrich at twenty-five years, others at fifty. The latter may prove to be nearer the mark.

During adult life a new crop of feathers would naturally develop to perfection once a year, but the farmers obtain three clippings in two years by cutting them at eight months (after the first year) and pulling out the stumps of quills when they have become dry.

The general method of rearing and treating the birds may now be briefly described. If the chicks—which will average ten to fifteen to a brood—have been hatched naturally they are allowed to remain with the parents till a couple of weeks old. They are then put into a "kraal," camp, or yard, under the care of the "herd." They are allowed to roam about during the day, and in the evening are taken into a shed, or more frequently a room in the farmer's house, where they are put into a box littered with dry straw, and are covered over with a blanket. Under this operation the little things whimper and express their feelings, whether of gratitude or protestation, with a low, piping trill; but are soon off to sleep. After a couple of months' sheltering at

night the chicks may be housed, in moderate weather, in any rough building, and after a time may be allowed to range the "veldt," or unfenced field, returning at night. When a thunder-storm or a hail-storm approaches, however, the farmer will bring in even the most hardy birds; for if the big hailstones of the South African skies should "come down with the rush of the storm," he may find a dozen or more of his birds beaten to death. The herd educates the young ones to domesticity by frequently calling them with a "cool—cool—cool," and rewarding their coming with a few dainty mealies. As they grow older they learn to expect these feeds at certain hours, and respond to the native boy's plaintive call as readily as a cow to the "coboss!" of an English herd. They are thus taught to return to the homestead at night. So tame do the young birds often become that they will gather round the affectionate black boy as if he were a mother. At one house I remember the chicks used to come regularly in the evening to hover under the herd's coat, which he would hang by a string from the roof for that purpose.

Sometimes at two and a half years, but more generally at four, a change comes over the young family. Some young cock in the troop grows proud and pugnacious. He greets the once respected herd with a contemptuous hiss, and perhaps without even that warning deals him such a blow with his foot as will clear the camp effectually. Some hen of the camp, whose scaly legs and bill now bloom with a rosy tint, surpassed only by the vermilion scales and bill of the cock, approves of this valor, and the result is a match.

This couple then becoming jealous, naturally fall to quarreling with all the dear companions of their chickenhood, and after shedding some innocent feathers in fight, they camp by themselves. Sometimes a young cock is most difficult to please in the choice of a mate, and will decline the companionship of every hen in the camp. He may have to be sold to a neighbor before he will make a selection. So with females, some of whom will fight till they die rather than mate with a cock they do not like. Some, and indeed a great proportion, notwithstanding their alleged polygamy, will never take more than one mate; while others will live with three or more. Farmers, however, seldom mate a cock with more than two, and monogamy is the domestic rule. When a cock takes a fancy to a hen who refuses to reciprocate the attachment, the bully kicks her about the camp until he either disfigures her or compels her to acknowledge him lord and master. This

submission once gained, he treats her with constant kindness. A pair of ostriches, however, when separated for any length of time, frequently become estranged till no trace of the former affection remains.

When the feathers are ready to be clipped the birds are either taken singly into a small pen, or a number of them are crowded together so closely in a larger pen that they can do little damage, and the feathers are cut. In the former case the bird is made more docile by taking a small bag, or, what is found more convenient, a toeless stocking, and slipping it over his head. While he is thus blinded and bewildered his plumes are cut, one at a time, about two inches above the root of the quill; these stumps being left to become dry, from two to four months afterward, when the bird is again brought up, they are pulled out with a pair of pincers. Even with these precautions the farmer often comes out of the operation with bleeding hands and torn clothes. Formerly—and it is even yet occasionally done—it was the custom to pluck the plume by hand or with the tweezers, leaving the poor bird bleeding and in pain, vinegar and oil being afterward rubbed on them to alleviate this pain. But a strange retribution followed this cruel process; for, before long, the new feathers grew out distorted and often twisted like a corkscrew, as if every twinge of pain had stamped deformity on the future feather. Out of the cock's wing come a row of twenty-four pure white plumes, sometimes two, three, or even four rows. The first row is known in the trade as "primaries," and from this row forward the color changes by shades into gray and finally to black. The female feathers are not so large or so pure as the male's. The feathers are put away, and sprinkled with pepper or camphor, to keep off insects or moths; but this care usually devolves on the agent who may arrange the feathers for market. At the inland towns of the colony, the feathers are taken to market either by farmer or agent, and are there sold by auction. They are then shipped by rail or wagon to Capetown, or Port Elizabeth, where they are carefully sorted into a dozen or more grades and sold in large quantities in the feather market. Port Elizabeth has the largest market for feathers, and here shrewd buyers or London agents may be seen on a Tuesday or Friday afternoon watching with keen eyes the "run" of the market. The feathers are here sold by auction also, and I have known the transactions of a single afternoon to amount to over thirty-five thousand dollars. Having been packed nicely in boxes, they are then shipped to London or Paris.

It has been commonly made to appear that

ostriches are so stupid or so greedy as to be totally indiscriminate in the matter of food; but this is a mistake. When two kinds of food are placed before them they will prefer the one, and are notably fond of certain kinds, such as mealies and prickly pears. Many of them even show delicate choice. But a hungry bird will eat almost anything. His system requires food in large quantity, but he always prefers the suitable kinds. It is a fact, however, that the ostrich often dies a victim of over-indulgence. On the farms birds also die by the score from apoplexy, brought on by their keepers stuffing them constantly with all they can eat. An incredible number of pebbles are sometimes found in an ostrich's stomach, where they serve the same purpose, in triturating the food, as sand in a pigeon's gizzard. Mr. Tillbrook, a farmer of the Graaff Reinet district, once found a carcass, the gizzard of which contained some nine hundred and thirty stones of sizes varying from that of a pea to that of a walnut. Most of them were bright and hard, and all more or less rounded by constant rubbing. We may see the reason of that instinct which prompts an ostrich to stretch his neck over the fence and pick off a gold stud or a diamond pin from the breast of the unsuspecting visitor, or in default of a jewel so attractive, to attempt to pull a button off his coat.

SEIZING A MEMENTO.

It is worthy of remark that the ostrich in its wild state will seldom attack a man, even in the breeding season, when it is most savage; while on the farms almost every farmer has to be on his guard against some

particular bird, which, whether breeding or not, is liable to attack him. It seems in fact to be almost a rule that the more domesticated the bird, the more vicious and uncertain is its conduct. A farmer informed me that one of his ostriches would attack him on almost any occasion with the utmost ferocity, while his son was never in danger. Another bird on the same farm had always, as it were, a smile for the father and a kick for the son. The word "kick" is used to designate an ostrich's blow, but the word is hardly correct.

When one approaches a vicious bird's camp at the breeding season the cock exalts his head and body, and coming toward the stranger with stately and very deliberate strides, begins to hiss loudly, like a goose or serpent, at the same time erecting all his feathers and spreading his wings till he becomes twice his usual size. When perhaps twenty yards off he drops suddenly on his knees, appearing as it were in a sitting posture. Curving his neck haughtily back over his body, he swings it swaggeringly from side to side, at each movement knocking his head violently against his body. In this performance he partly fills his throat with air, so that every thud is accompanied by a peculiar gurgling sound; while, keeping time to these movements, his great wings swing alternately backward and forward in a boastful manner. This is called the "challenge." It is well named, for there is a bragging, tread-on-the-tail-o'-me-coat air about it that would be irresistibly laughable—if only it could be seen from the safe side of a tall fence, instead of over the low barrier of dried bushes of which most camps are composed. After continuing the challenge from five minutes to a quarter of an hour, the bird leaps up and comes toward you with a jaunty bound, but after a few steps drops down again to repeat the challenge. Thus reaching the fence he paces up and down angrily in his eagerness to get out, or hisses and dances in rage before you, with wings elevated like two enormous fans. He is ever threatening to leap the fence, but, happily for the nervous visitor, he never does it. A very low fence will suffice to keep them within bounds, and unless panic-struck they will seldom jump either fence or ditch. Their movements in getting over a steep ditch are very ludicrous and awkward, showing their unfitness for traversing uneven ground. When a farmer goes into a savage bird's camp he takes with him a thorn pole, with a branch or two of the thorny bush left on the end. This is called a "tuck," and when the tuck is applied to the ostrich's neck or head (his tender points) he is almost invariably subdued, and, after one or two efforts

A DUEL.

to escape, bolts furiously off to the other side of the camp, where he races up and down to vent his baffled rage. If, however, the bird gets near enough to his opponent to give the so-called kick, he lifts his bony leg as high as his body and throws it forward with demoniac grotesqueness, and brings it down with terrible force. His object is to rip the enemy down with his dangerous claw, but in most cases it is the flat bottom of his foot which strikes, and the kick is dangerous as much from its sheer power as from its lacerating effects. It is a movement of terrible velocity and power, at all events. Several instances may be mentioned of herd-boys being thus either wounded, maimed, or killed outright. One case occurred near Graaff Reinet, in which a horse had his back broken by a single blow. In this case the bird had endeavored to kill the rider, but missed him and struck the horse.

Many persons have been set upon by birds when there was no shelter, not even a tree to run to. In such a case, if the pursued were acquainted with struthious tactics, he would lie down flat on the ground, where the bird finds it impossible to strike him. But even this is no light matter, for some birds in their rage at being baffled of their kick, will roll over their prostrate enemy, bellowing with fury and trampling upon him in the most contemptuous fashion. One man who thus attempted the lying-down plan found that every time he attempted to rise the bird would return and stand sentry over him, till

at last, after creeping a distance he got out only by swimming a pond that bounded one side of the camp.

While ostriches frequently attack men during the breeding season, they more frequently fight one another. They have an instinctive pride in the rule of their own homes, and will fight with much greater energy an enemy within their own camp, than when they are themselves the invaders. To one unaccustomed to brutal contests an ostrich fight is really a spectacle of terror; and if the old Romans had only known what terrible creatures they could be made, an ostrich fight would have been a crowning sensation in the gladiatorial arena. After various challenges they come into collision with mad fury, and with their legs deal blows upon each other, first from one side and then from the other, with tremendous force and effect. Having fought a round they retire a space, and then return to the attack till one or the other bolts off beaten. Occasionally where there is no escape the victor kicks his exhausted enemy until he kills him; and often a leg is broken in the fight. Hens are seldom savage under any circumstances, and among the cocks there is an endless diversity of disposition as to viciousness and general character.

The idea which still prevails that the ostrich is invariably a negligent or heartless parent is a great error. It is quite true that the wild birds' eggs are often found in the "veldt," but in the wild state a cock often mates with two or three hens, and as one nest cannot contain all the eggs laid, many are deposited on the ground or thrown out of the nest. They may then become food for the chicks or the parents, or be eaten by wild animals. As the cock does the most important part of the sitting, only one nest can be provided to a family, and the surplus eggs are wasted only because of inability to hatch so many in their natural state. It is true that the parents sometimes neglect their nests, or break off sitting and scatter the eggs, or even eat them all; but it is not the rule. Mr. A. Mitchinson, an experienced West-Coast traveler, informed me that on one occasion he found a chicken, apparently self-hatched, in one of these scattered eggs in the veldt, but it died two or three days after coming out, and it seems certain that in South Africa, at least, none are ever hatched in the sun in that way.

In making a nest some pairs will take a natural depression in the ground or scratch a few handfuls of earth away in the most careless manner, and there do their hatching, but most of them will construct nests with care. The cock may be seen scooping and

raking up the earth industriously, and after he has a capacious hollow like a large saucer scraped out he will call the hen to look at it, and with their heads together they will hold some unreportable conversation over it. When the first eggs are being laid, the hen will finish the structure by scooping up a rim of earth with her bill, thus leaving a trench about it to protect it from possible rains. Having laid, say fourteen eggs, they begin sitting. The cock is the most attentive sitter, and contrary to what has been stated in some books sits always at night. He goes upon the nest at about four or five in the afternoon and remains till about eight or nine in the morning. The hen being already somewhat exhausted by laying, her short term of duty gives her a better chance to keep up her strength. Each pair, however, appear to have their own individual understanding as to the hour of changing guard, and whether it be eight or ten o'clock A. M. or three or five P. M. are usually as regular in attendance as if they knew the hour by the clock. Illustrating this, a farmer relates that one of his birds, on leaving the nest one morning did not find the hen near to take his place. Indignant at his consort's neglect, he sought her out at the other end of the camp and with vigorous kicks drove the dilatory dame down to the nest, where she submissively resumed her duty. The care which even tame birds take to conceal the whereabouts of their nests is interesting to witness. The cock on rising will slowly and gently lift his bony shanks up from among the eggs, and when they have fallen together will step clear and make a bolt away in one direction for a few feet, then suddenly sidle off at an angle, as if jostled rudely, and again swerve abruptly in another direction. These grotesque maneuvers, which make one think the bird may be intoxicated, are evidently intended to deceive a possible spectator as to the direction the bird has come from. The female, after an interval, will come to the nest with equal sleight; grazing aimlessly this way and that, till near the nest, when she swoops down, hovering over it till she disposes her legs among the eggs. After turning the eggs over one by one with her beak, she will sit perhaps for hours with her head stretched flat and snake-like on the ground, and her body as motionless as a mound of earth. Occasionally, in hot days, she may be seen with her body lifted slightly out of the nest to admit a current of air over the eggs; and sometimes she will even leave the nest for two or three hours, till instinct tells her that the lowering temperature requires her return. While sitting the birds may be heard sometimes to whim-

per their solicitude for the forthcoming brood; and when incubation is finished, they often assist the chicks out of the shell. When the young birds have begun to show appetite, the old ones teach them to eat by walking before them and picking at the grass and insects, the cock perhaps striding behind keeping a lookout.

When an enemy in the shape of a hawk or a four-footed animal appears in sight, the old bird gives a peculiar fluttering shake of her wings, and in an instant the whole brood are scattered abroad and lost to sight. Each bird throws itself flat on the ground—under a bush or grass if he can—and there they lie with their little necks flat on the ground, still as a lump of earth. And so much like both earth and grass do they look that even a person long familiar with them might walk among them without seeing them; nor will they stir even at the risk of being trod upon. When the danger has passed, the parent bird, who in the meantime may have gone far away, calls her chicks from their concealment by uttering a plaintive “Whoo! whoo! whoo!” which can be heard a long distance. The worst foes of the ostrich—next to the internal ones of tape-worms—are the wild-cat and jackal. The wild-cat and his fellow foes appear at night, and often worry the poor birds all night long. As long as a bird can keep his nest, the eggs are safe; knowing this, these thievish enemies tantalize and exasperate the bird so as to provoke him into getting off to drive them away. If he does so then one of them leaps in, and the

A HEN'S EGG AND AN OSTRICH'S EGG. [SHOWING COMPARATIVE SIZES.]

moment they are in possession the ostrich in most cases abandons the spot. Cats, wolves, and tigers have been known thus to work in conspiracy. But should they get possession they still find a difficulty, as the eggs are too big to encompass with their teeth. The cunning thieves then roll them away till they reach some rock and there dash them against the stone with their paws till they are broken. The farmer sets baits of poisoned meat in

DRIVING OSTRICHES IN A STORM.

A MALE OSTRICH.

various places around the nests, and in some localities wild-cats are thus destroyed at the rate of one or two a day. The porcupine, too, is a great sneak thief at night, but the ostrich is usually more than a match for him. The hawk is an enemy chiefly to the chicks, but the crow destroys the eggs. This is a large, white-breasted rook, and the statement made by travelers that it destroys eggs by dropping stones into them is no fiction. Mr. J. H. Featherstone, of Mount Stewart, Uitenhage, once saw a crow, which had espied the nest of one of his birds, go to a river-bed some distance off, select a stone from it, and then fly up high in the air with the stone in its claws over a vacant nest. Having secured the perpendicular by some instinctive engineering of his own, the rook let drop the stone. The aim was precise, and down he came to feast on the egg which his missile had broken.

A peculiarity of young ostriches, not the least interesting and amusing, is their waltzing proclivities. On being let out in the morning the young troop dart off, one after another; then, stopping suddenly, they give themselves a whirl about, and proceeding on a few paces, repeat the revolution, each time slightly ducking their heads, a gesture which gives a certain grotesque grace to the movement. When a troop are performing it together their move-

ments are frequently synchronous, and their noddings in perfect time,—a comical caricature on the movements of the human dance. Sometimes a bird will make five or six gyrations in succession, but others only swerve fantastically from side to side, with wings flaunting as they go, like a romping girl's dress. So engrossed do they appear to become and so reckless that they have been known to break a leg in "the giddy whirl." Their weight, and the awkward suddenness with which they halt and swing about, render such an accident quite possible. They sometimes keep the dance up for an hour or more, careering first to one side of the field and then to the other—but they do not go quite to human excesses in the diversion.

There is plenty of evidence to show that the ostrich is not really dull of hearing, as is said; and he is certainly acute of smell and taste as well as of sight. They hear their owner's call or the crack of a whip a long way off, and it is often difficult to get them to take certain kinds of physic, even though it may be carefully concealed in their food. The old notion that the ostrich buries his head in the sand in case of danger proves to be another of the numerous natural history "facts" which are utterly mythical. I am sorry to disturb so venerable a proverb, especially as it points so true and good a moral, but recent observations do not confirm the saying. The ostrich may be very stupid, but he has never attained such achievements of folly. It is true, however, that the wild birds, when run down, are known to tumble to the earth and thrust their necks under a bush, and this may have given rise to the proverb.

But the ostrich is a wonderful paradox, and many proverbs equally useful, with the advantage of being true, may be constructed by the student of the domestic camp. He is capable of scanning the whole horizon and yet falling easily into some hole under his feet; he is both a gourmand and an epicure; he may be kept in bounds by a fence of a single wire, yet when panic-stricken, he will risk a collision with a stone wall, and dash himself to death; he is both blood-thirsty and gentle; bolder than a lion and more timid than a springbok; a polygamist and a celibate; capable of extreme parental tenderness yet sometimes eating his own offspring; at once the stupidest and the most cunning of birds.

As already said, South Africa supplies the great bulk of the ostrich feathers of the world. It sends out feathers to the value of a million pounds sterling, while Egypt exports to the value of only £250,000, and the Barbary states to the value of only about £20,000. The latter classes justly command a higher price, but

not one-twentieth of the feathers sold as Egyptian or Barbary plumes are anything else than Cape feathers, for there are plenty of tricks in the feather trade. The Barbary feathers are shipped chiefly from Tripoli (whence they frequently take that name) through Marseilles or Leghorn to Paris or London; and the Egyptian feathers find the same destination, having come to Cairo by caravan. In each case the feathers before shipment are

care of the birds is becoming so well understood that ostriches of the high and dry regions of the Cape now produce feathers undistinguishable from the best wild ones.

The South African plume in its raw state is characterized by its breadth of barb, and each individual barb has a richer floss, but the barbs not being so close set as those of the North African birds, the plume has a thinner appearance. The shaft, though full as long,

A TROOP OF YOUNG OSTRICHES.

“roped” for the market; which means that in sorting them into grades the choicest are picked out and sold privately at high prices to speculators and others, who retail them to wealthy European ladies at fabulous figures; the poorer qualities are made up in parcels, and classed as the best. The same thing is done with Cape feathers, and thus it is that a really first-class feather can seldom be got from the dealers. One of the arts is to dress up a “barred” feather so that it can be sold for as much as a perfect plume. As the young feather grows out it is covered at the roots with a thin sheathing of skin, which as it develops the bird picks off. If the bird should become unhealthy and listless it may neglect to remove this sheathing, and little rings or bars are formed across the plume. Such feathers bring a poor price among the dealers, but form a feature of the dresser’s profits. There is much nonsense, also, in the talk about specialties in “wild” feathers, for the

is straighter and less graceful than a Barbary bird’s; but it has a compensating advantage in bleaching to a far purer white. Prime white Cape feathers are at first whiter than any bleaching could make them, and often the bleaching is only necessary because of careless handling and exposure. The great point of natural beauty in a feather, in addition to its richness of plumage, is the graceful curve taken by the quill toward the tip. The local influences of climate and soil in producing fine feathers are now becoming better understood. The reputation and value of the dry Karoo lands, which used to be put down on the maps as hopeless deserts, have of late increased. What is of more importance to the Cape farmers is that when the pure Barbary ostrich has become acclimatized, South Africa will export not only the largest quantity, but the finest quality of feathers in the world,—except, perhaps, what may be produced on the plains of Syria.

*E. B. Biggar.*

## THE DEBT OF SCIENCE TO DARWIN.

DARWIN'S STUDY.

THE great man so recently taken from us had achieved an amount of reputation and honor perhaps never before accorded to a contemporary writer on science. His name has given a new word to several languages, and his genius is acknowledged wherever civilization extends. Yet the very greatness of his fame, together with the number, variety, and scientific importance of his works, has caused him to be altogether misapprehended by the bulk of the reading public. Every book of Darwin's has been reviewed or noticed in almost every newspaper and periodical, while his theories have been the subject of so much criticism and so much dispute, that most educated persons have been able to obtain some general notion of his teachings, often without having read a single chapter of his works,—and very few, indeed, except professed students of science, have read the whole series of them. It has been so easy to learn something of the Darwinian theory at second-hand, that few have cared to study it as expounded by its author.

It thus happens that, while Darwin's name and fame are more widely known than in the case of any other modern man of science, the real character and importance of the work he

did are as widely misunderstood. The best scientific authorities rank him far above the greatest names in natural science—above Linnæus and Cuvier, the great teachers of a past generation—above De Candolle and Agassiz, Owen and Huxley, in our own times. Many must feel inclined to ask,—What is the secret of this lofty preëminence so freely accorded to a contemporary by his fellow-workers? What has Darwin done, that even those who most strongly oppose his theories rarely suggest that he is overrated? Why is it universally felt that the only name with which his can be compared in the whole domain of science is that of the illustrious Newton?

It will be my endeavor in the present article to answer these questions, however imperfectly, by giving a connected sketch of the work which Darwin did, the discoveries which he made, the new fields of research which he opened up, the new conceptions of nature which he has given us. Such a sketch may help to clear away some of the obscurity which undoubtedly prevails as to the cause and foundation of Darwin's preëminence.

In order to understand the vast and fundamental change effected by the publication of Darwin's most important volume—"The

DOWN HOUSE, FROM THE GARDEN.

Origin of Species,"—we must take a hasty glance at the progress of the science of natural history during the preceding century.

Almost exactly a hundred years before Darwin, we find Linnæus and his numerous disciples hard at work describing and naming all animals and plants then discovered, and classifying them according to the artificial method of the great master, which is still known as the Linnæan System; and from that time to the present day a large proportion of naturalists are fully occupied with this labor of describing new species and new genera, and in classifying them according to the improved and more natural systems which have been gradually introduced. But another body of students have always been dissatisfied with this superficial mode of study-

ing externals only, and have devoted themselves to a minute examination of the internal structure of animals and plants; and early in this century the great Cuvier showed how this knowledge of anatomy could be applied to the classification of animals according to their whole organization in a far more natural manner than by the easier method of Linnæus. Later on, when improved microscopes and refined optical and chemical tests became available, the study of anatomy was carried beyond the knowledge of the parts and organs of the body—such as bones, muscles, blood-vessels, and nerves—to the investigation of the tissues, fibers, and cells of which these are composed; while the physiologists devoted themselves to an inquiry into the mode of action of this complex machinery, so as to

discover the use of every part, the nature of its functions in health and disease, and, as far as possible, the nature of the forces which keep them all in action.

Down to the middle of the present century the study of nature advanced with giant strides along these separate lines of research, while the vastness and complexity of the subject led to a constantly increasing specialization and division of labor among naturalists, the result being that each group of inquirers came to look upon its own department as more or less independent of all

exists or ever has existed on the globe was known to involve difficulties and contradictions of the most serious nature; although it was seen that many of the facts revealed by comparative anatomy, by embryology, by geographical distribution, and by geological succession, were utterly unmeaning, and even misleading, in view of it; yet, down to the period we have named, it may be fairly stated that nine-tenths of the students of nature unhesitatingly accepted it as literally true, while the other tenth, though hesitating as to the actual independent creation, were none the less

DOWN HOUSE, FROM THE PATHWAY TO THE VILLAGE.

the others: each seemed to think that any addition to its body of facts was an end in itself, and that any bearing these facts might have on other branches of the study or on the various speculations as to the "system of nature" or the "true method of classification" that had at various times been put forth, was an altogether subordinate and unimportant matter. And, in fact, they could hardly think otherwise. For, while there was much talk of the "unity of nature," a dogma pervaded the whole scientific world which rendered hopeless any attempt to discover this supposed unity amid the endless diversity of organic forms and structures, while so much of it as might be detected would necessarily be speculative and unfruitful. This dogma was that of the original diversity and permanent stability of species, a dogma which the rising generation of naturalists must find it hard to believe was actually held, almost universally, by the great men they look up to as masters in their several departments, and held for the most part with an unreasoning tenacity and scornful arrogance more suited to politicians or theologians than to men of science. Although the doctrine of the special and independent creation of every species that now

decided in rejecting utterly and scornfully the views elaborated by Lamarck, by Geoffroy St. Hilaire, and more recently by the anonymous author of the "Vestiges of Creation"—that every living thing had been produced by some modification of ordinary generation from parents more or less closely resembling it. Holding such views of the absolute independence of each species, it almost necessarily followed that the only aspect of nature of which we could hope to acquire complete and satisfactory knowledge was that which regarded the species itself. This we could describe in the minutest detail; we could determine its range in space and in time; we could investigate its embryology from the rudimental germ, or even from the primitive cell, up to the perfect animal or plant; we could learn every point in its internal structure, and we might hope, by patient research and experiment, to comprehend the use, function, and mode of action of every tissue and fiber, and ultimately of each cell and organic unit. All this was real knowledge, was solid fact. But, so soon as we attempted to find out the relations of *distinct species* to each other, we embarked on a sea of speculation. We could, indeed, state *how* one species differed from

another species in every particular of which we had knowledge; but we could draw no sound inferences as to the reason or cause of such differences or resemblances, except by claiming to know the very object and meaning of the Creator in producing such diversity. And, in point of fact, the chief inference that was drawn is now proved to be erroneous. It was generally assumed, as almost self-evident, that the ultimate cause of the differences in the forms, structures, and habits of the organic productions of different countries, was that each species inhabiting a country was specially adapted to the physical conditions that prevailed there, to which it was exactly fitted. Even if this theory had been true, it was an unproductive ultimate fact, for it was never pretended that we could discover any reason for the limitation of humming-birds and cactuses to America, of hippopotami to Africa, or of kangaroos and gum-trees to Australia; and we were obliged to believe either that these countries possessed hidden peculiarities of climate or other conditions, or that this was only one out of many unknown and unknowable causes determining the special action of the creative power. All this was felt to be so unsatisfactory that the majority of naturalists openly declared that their sole business was to accumulate facts, and that any attempt to coördinate these facts and see what inferences could be drawn from them was altogether premature. In this frame of mind, year after year passed away, adding its quota to the vast mass of undigested facts which were accumulating in every branch of the science. The remotest parts of the globe were ransacked to add to the treasures of our museums, and the number of known species became so enormous that students began to confine themselves not merely to single classes, as birds or insects, but to single orders, as beetles or land-shells, or even to smaller groups, as weevils or butterflies. All, too, were so impressed with the belief in the reality and permanence of species, that endless labor was bestowed on the attempt to distinguish them,—a task whose hopelessness may be inferred from the fact that, even in the well-known British flora, one authority describes sixty-two species of brambles and roses, another of equal eminence only ten species of the same groups; and it is by no means uncommon for two, five, or even ten species of one author to be classed as a single species by another. All this time geologists had been so assiduously at work in the discovery of organic remains that the extinct species often equalled, and, in some groups—as the Mollusca—very far exceeded those now living on the earth, and these were all found to belong to the very same classes and orders,

THE GREENHOUSE IN WHICH MR. DARWIN'S EXPERIMENTS AND OBSERVATIONS WERE MADE.

and to form part of one great system. Much attention was now paid to the geological succession of the different groups of animals, which were found to exhibit a progressive advancement from ancient to recent times, while the great breaks in the series between distinct great geological formations were held to show that the older forms of life had been destroyed, and were replaced by a new creation of a more advanced organization suited to the altered conditions of the world.

And thus, perhaps, we might have gone on to this day, ever accumulating fresh masses of fact, while each set of workers became ever more and more occupied in their own departments of study, and, for want of any intelligible theory to connect and harmonize the whole, less and less able to appreciate the labors of their colleagues, had not Charles Darwin made his memorable voyage around the world, and thenceforth devoted himself, as so many had done before him, to a life of patient research in the domain of organic nature. But how different was the result! Others have added greatly to our knowledge of details, or have created a reputation by some important work; he has given us new conceptions of the world of life, and a theory which

DARWIN'S USUAL WALK.

is itself a powerful instrument of research; has shown us how to combine into one consistent whole the facts accumulated by all the separate classes of workers, and has thereby revolutionized the whole study of nature. Let us endeavor to see by what means he arrived at this vast result.

Passing by the ancestry and early life of Darwin, which have been made known to the whole reading public by countless biographical notices, we may begin with the first event to which we can distinctly trace his future greatness—his appointment as naturalist to the *Beagle*, on the recommendation of his friend and natural history teacher, Professor Henslow, of Cambridge University. It was in 1831, when Darwin, then twenty-two years of age, had just taken his B. A., that he left England on his five years' voyage in the Southern Hemisphere. It is probably to this circumstance that the world owes the great revolution in our conception of the organic world so well known as the Darwinian theory. The opportunity of studying nature in new and strange lands; of comparing the productions of one country with those of another; of investigating the physical and biological relations of islands and continents; of watching the struggle for existence in regions where civilization has not disturbed the free action and reaction

of the various groups of animals and plants on each other; and, what is perhaps more important still, the ample leisure to ponder again and again on every phase of the phenomena which presented themselves, free from the attractions of society and the disturbing excitement of daily association with contemporary men of science,—these are the conditions most favorable to the formation of habits of original thought, and the months and years which at first sight appear intellectually wasted in the companionship of uncivilized man, or in the solitary contemplation of nature, are those in which the seed was sown which was destined to produce in after-years the mature fruit of great philosophical conceptions. Let us then first glance over the "Journal of Researches," in which are recorded the main facts and observations which struck the young traveler, and see how far we can detect here the germs of those ideas and problems to the working out of which he devoted a long and laborious life.

The question of the causes which have produced the distribution and the dispersal of organisms seems to have been with him a constant subject of observation and meditation. At an early period of the voyage he collected infusorial dust which fell on the ship when at sea, and he notes the suggestive fact that in sim-

ilar dust collected on a vessel three hundred miles from land he found particles of stone above the thousandth of an inch square, and remarks: "After this fact, one need not be surprised at the diffusion of the far lighter and smaller sporules of cryptogamic plants." He records many instances of insects occurring far out at sea, on one occasion when the nearest land was three hundred and seventy miles distant. He paid special attention to the insects and plants inhabiting the Keeling or Cocos, and other recently formed coralline or volcanic islands; the contrast of these with the peculiar productions of the Galapagos evidently impressed him profoundly; while the remarkable facts presented by this latter group of islands brought out so clearly and strongly the insuperable difficulties of the then accepted theory of the independent origin of species, as to keep this great problem ever present to his mind, and, at a later period, to lead him to devote himself to the patient and laborious inquiries which were the foundation of his immortal work. He again and again remarks on the singular facts presented by these islands. Why, he asks, were the aboriginal inhabitants of the Galapagos created on American types of organization, though the two countries differ totally in geological character and physical conditions? Why are so many of the species peculiar to the separate islands? He "is astonished at the amount of creative force, if such an expression may be used, displayed in these small, barren and rocky islands; and still more so at its diverse, yet analogous action on points so near each other."

The variations which occur in species, as well as the modifications of the same organ in allied species,—subjects which had been much neglected by ordinary naturalists,—were constantly noted and commented on. He remarks on the occasional blindness of the burrowing tucutucu of the pampas as supporting the view of Lamarck on the gradually acquired blindness of the aspalax; on the hard point of the tail of the trigonocephalus, which constantly vibrates and produces a rattling noise by striking against grass and brushwood, as a character varying toward the complete rattle of the rattlesnake; on the small size of the wild horses in the Falkland Islands, as progressing toward a small breed like the Shetland ponies of the north; and on the strange fact of the cattle having increased in size, and having partly separated into two differently colored breeds. While collecting the remains of the great extinct mammals of the pampas, he was much impressed by the fact that, however huge in size or strange in form, they were all allied to living South

American animals, as are those of the cave-deposits of Australia to the marsupials of that country; and he thereon remarks: "This wonderful relationship in the same continent between the dead and the living, will, I do not doubt, hereafter throw more light on the appearance of organic beings on our earth, and their disappearance from it, than any other class of facts."

He also saw, at this early period, the important fact that there is some great and constant check to the increase of wild animals, though most of them breed very rapidly, and, of course, would increase in a geometrical ratio were some such check not in constant action. He traces the comparative rarity of a species to less favorable conditions of existence, and extinction to the normal action of still more unfavorable conditions, and compares the destruction of a species by man and its extinction by its natural enemies as being phenomena of the same essential nature. The various classes of facts here referred to seemed to him "to throw some light on the origin of species—that mystery of mysteries, as it has been called by one of our greatest philosophers"; and he tells us that, soon after his return home in 1837, it occurred to him "that something might perhaps be made out on this question by patiently accumulating and reflecting on all sorts of facts which could possibly have any bearing upon it." We know from his own statement that he had already perceived that no explanation but some form of the derivation or development hypothesis, as it was then termed, would adequately explain the remarkable facts of distribution and geological succession which he had observed during his voyage; yet he tells us that he worked on for five years before he allowed himself to speculate on the subject; and then, having formulated his provisional hypothesis in a definite shape during the next two years, he devoted fifteen years more to continuous observation, experiment, and literary research, before he gave to the astounded scientific world an abstract of his theory in all its wide-embracing scope and vast array of evidence, in his epoch-making volume, "The Origin of Species."

If we add to the periods enumerated above the five years of observation and study during the voyage, we find that this work was the outcome of *twenty-nine* years of continuous thought and labor, by one of the most patient, most truth-loving, and most acute intellects of our age. During all this long period only a very few of his most intimate friends were aware that he had departed from the then beaten track of biological study, while the great body of naturalists only knew him as a

good geologist, as the writer of an interesting book of travels, and the author of an admirable monograph of the arthropoda or barnacles, as well as of a most ingenious explanation of the origin and structure of coral-reefs—a series of volumes which were the direct outcome of his voyage, and which gave him an established reputation. Even when the great work at last appeared, few could appreciate the enormous basis of fact and experiment on which it rested, until, during the succeeding twenty years, there appeared that remarkable succession of works which exhibited a sample (and only a sample) of the exhaustless store of materials and the profound maturity of thought on which his early volume was founded. From these various works, aided by some personal intercourse and a correspondence extending over twenty years, the present writer will endeavor to indicate the nature and extent of Darwin's researches.

ALTHOUGH, as we have said, Darwin had early arrived at the conclusion that allied species had descended from common ancestors by gradual modification, it long remained to him an inexplicable problem how the necessary degree of modification could have been effected, and he adds: "It would thus have remained forever, had I not studied domestic productions, and thus acquired a just idea of the power of selection." These researches, very briefly sketched in the first and parts of the fifth and ninth chapters of the "*Origin of Species*," were published at length (after a delay of nine years, owing to ill health) in two large volumes, with the title "*Animals and Plants under Domestication*;" and no one who has not read these can form an adequate idea of the wide range and thorough character of the investigation on which every statement or suggestion in the former work was founded. The copious references to authorities show us that Darwin must have searched through almost the entire literature of agriculture and horticulture, of horse and cattle breeding, of sporting, of dog, cat, pigeon and fowl fancying, including endless series of reviews, magazines, journals of societies, and newspapers, besides every scientific treatise bearing in any way on the subject, whether published in England, on the Continent, or in America. The facts thus laboriously gathered were supplemented by personal inquiries among zoölogists and botanists, farmers, gardeners, sporting-men, pigeon-fanciers, travelers, and any one who could possibly afford direct personal information on any of the matters he was investigating. Then came his own observation and experiment, to fill

up gaps, to settle doubtful points, or to determine questions the importance of inquiring into which no one had ever suspected; and lastly, there was the power of arrangement and comparison, the originality and depth of thought, which drew out from this vast mass of heterogeneous materials conclusions of the highest value as bearing on the question of the possible change of species, and the means by which it had been brought about.

In order to determine the nature and amount of the variability of domestic productions, he prepared skeletons of all the more important breeds of rabbits, pigeons, fowls, and ducks, as well as of the wild races from which they are known to have been produced, and showed, both by measurements and by accurate drawings, that not only superficial characters, but almost every part of the bony structure varied to such an amount as usually characterizes very distinct species or even distinct genera of wild animals. Another set of experiments was made by crossing the different breeds of pigeons and fowls which were most completely unlike the wild race, with the result that in many cases the offspring were more like the wild ancestor than either of the parents. These experiments, supported by a mass of facts observed by other persons, served to establish the principle of the tendency of crosses to revert to the ancestral form; and this principle enabled him to explain the interesting fact of the frequent appearance of stripes on mules, and occasionally on dun-colored horses, on the hypothesis, supported by a mass of collateral evidence, that the common ancestor of the horse, ass, and zebra tribe was a striped and dun-colored animal.

A number of very important conclusions were deduced from the facts presented by domesticated animals and plants, a few of which may be here referred to. For example, it was proved that the parts most selected or which had already most varied—as the tail in fan-tailed pigeons, which has more tail-feathers than any other of the eight thousand different kinds of living birds,—were most subject to further variation; and this showed that, when once any part had begun to change, variations became more abundant, thus furnishing materials to render still further change in the same direction comparatively easy. This is the secret of the rapid improvement of breeds or races, and is equally applicable to the formation of species by natural selection. Again, it was found that in many cases, when much variation occurred, there was a tendency to a difference in the sexes which had not before existed. This has been observed in sheep,

in fowls, and in pigeons, and it is very interesting as indicating the origin of that wonderful diversity of sex which occurs in several groups of animals. Another curious fact is the correlation of parts which occurs in many animals, such as the tusks and bristles of swine, and the hair and teeth in some dogs, both increasing or becoming lost together; the beaks and feet of pigeons, both increasing or diminishing together; the color and size of the leaves and seeds changing simultaneously in some plants; and numerous other instances which serve to explain some of the peculiar characters of natural objects for which we can discover or imagine no direct use.

The effects of disuse in causing the diminution of an organ was exhibited by careful comparison and measurements of tame and wild birds. The sternum, scapulæ, and furcula to which the muscles used in flight are attached, are found to be diminished in domestic pigeons, as were the wing-bones in domestic fowls, the capacity of the skull in tame rabbits, and the size and strength of the wings in silkworm moths. The evidence afforded by the breeds of pigeons (which have been domesticated for so many centuries and in so many parts of the world) of the process of selection, whether unconscious or methodical, is very clearly set forth, and serves as a typical example with which to compare the various phenomena presented by allied species in a state of nature; and in considering that evidence he thus replies to some objections:

"I have heard it objected that the formation of the several domestic races of the pigeon throws no light on the origin of the wild species of the columbidæ, because their differences are not of the same nature. The domestic races, for instance, do not differ, or hardly at all, in the relative lengths and shapes of the primary wing-feathers, in the relative length of the hind toe, or in habits of life, as in roosting and building on trees. But the above objection shows how completely the principle of selection has been misunderstood. It is not likely that characters selected by the caprice of man should resemble differences preserved under natural conditions, either from being of direct service to each species, or from standing in correlation with other modified and serviceable structures. Until man selects birds differing in the relative length of the wing-feathers or toes, etc., no sensible change in these parts should be expected. \* \* \* With respect to the domestic races not roosting or building in trees, it is obvious that fanciers would never attend to or select such changes in habits."

Still more remarkable, perhaps, is the collection of facts afforded by plants, which can be so much more easily cultivated and

experimented upon than animals, while the general phenomena they present are strikingly accordant in the two kingdoms. As an example of the great mass of facts afforded by horticulture, he records that three hundred distinct varieties were produced, in the course of fifty years, from a single wild rose (*Rosa spinosissima*). We find in these volumes enormous collections of facts on bud-variation, or the occurrence of changes in the flower or leaf-buds of full-grown plants, from which new varieties can be and often are produced; and, after a most full and interesting discussion of the cases, it is shown that some are probably due to reversion to an ancestral form, others to reversion to one parent when the plant has been derived from a cross, and others, again, to that spontaneous variability which seems to be the universal characteristic of all living organisms.

Three very interesting chapters are then devoted to the subject of inheritance, and a host of strange and heretofore inexplicable facts are brought together, compared, and classified, and shown to be in accordance with a few general principles. Then follow five chapters on crossing and hybridism, perhaps the most important in the whole work, since they afford the clue to so much of the varied structure and complex relations of animals and plants. Notwithstanding the enormous mass of facts and observations here given, the portion relating to plants is often but an abstract of the results of his own elaborate experiments, carried on for a long series of years, and given at length in three separate volumes on "The Fertilization of Orchids," on "Cross and Self-Fertilization of Plants," and on "The Forms of Flowers." These works may be said to have revolutionized the science of botany, since, for the first time, they gave a clear and intelligible reason for the existence of that wonderful diversity in the form, colors, and structure of flowers, on the details of which the systematic botanist had founded his generic and specific distinctions, but as to whose meaning or use he was, for the most part, profoundly ignorant. The investigation of the whole subject of crossing and hybridity had shown that, although hybrids between distinct species usually produced sterile offspring, yet crosses between slightly different varieties led to increased fertility; and, during some experiments on this subject, Darwin found that the produce of these crosses were also remarkable for vigor of growth. This led to a long series of experimental researches, the general result of which was to establish the important proposition that cross-fertilization is of the greatest importance to the health, vigor, and fertility

of plants. The fact that the majority of flowers are hermaphrodite, and appear to be adapted for self-fertilization, seemed to be opposed to this view, till it was found that, in almost every case, there were special arrangements for insuring, either constantly or occasionally, the transference of pollen from the flowers of one plant to those of another of the same species. In the case of orchids, it was shown that those strange and beautiful flowers owed their singular and often fantastic forms and exceptional structure to special adaptations for cross-fertilization by insects, without the agency of which most of them would be absolutely sterile. Many of the species are adapted to particular species or groups of insects, and can be fertilized by no others; and careful experiment and much thought was often required to find out the exact way in which this was effected. In some instances the structure of the flowers seemed adapted to prevent fertilization altogether, till it was at length discovered that a particular insect entering the flower in one particular way caused the pollen to stick to some part of its body, which was always the exact part which the insect, on visiting another flower, would bring in contact with the stigma, and thus fertilize it. These investigations explained a host of curious facts which had hitherto been facts only without meaning, such as the twisting of the ovary in most of our wild orchids, which was found to be often necessary to bring the flower into a proper position for fertilization,—the existence of sacs, cups, or spurs, the latter often of enormous length, but shown to be each adapted to the structure of some particular insect, and often serving to prevent other insects from reaching the nectar which they might rob without fertilizing the flower,—the form, size, position, rugosities, or color of the lip, serving as a landing-place for insects and a guide to the nectar-secreting organs,—the varied odors, sometimes emitted by day, and sometimes by night only, according as the fertilizing insect was diurnal or nocturnal, and other characters too numerous to refer to here, so that it became evident that every peculiarity of these wonderful plants, in form or structure, in color or marking, in the smoothness, rugosity, or hairiness of parts of the flower, in their times of opening, their movements, or their odors, had its special purpose, and was, in some way or other, adapted to secure the fertilization of the flower and the preservation of the species.

The next set of observations, on some of our commonest English flowers of apparently simple structure, were not less original and instructive. The cowslip (*Primula veris*) has

two kinds of flowers in nearly equal proportions: in the one the stamens are long and the style short, and in the other the reverse, so that in the one the stamens are visible at the mouth of the tube of the flower, in the other the stigma occupies the same place, while the stamens are half way down the tube. This fact had been known to botanists for seventy years, but had been classed as a case of mere variability, and therefore considered to be of no importance. In 1860 Darwin set to work to find out what it meant, since, according to his views, a definite variation like this *must* have a purpose. After a considerable amount of observation and experiment, he found that bees and moths visited the flowers, and that their probosces became covered with pollen while sucking up the nectar, and further, that the pollen of a long-stamened plant would be most surely deposited on the stigma of the long-styled plants, and *vice versa*. Now followed a long series of experiments, in which cowslips were fertilized either with pollen from the same kind or from a different kind of flower, and the invariable result was that the crosses between the two different kinds of flowers produced more good capsules, and more seeds in each capsule; and as these crosses would be most frequently effected by insects, it was clear that this curious arrangement directly served to increase the fertility of this common plant. The same thing was found to occur in the primrose, and in many other species of Primulaceæ, as well as in flax (*Linum perenne*), lungworts (*Pulmonaria*), and a host of other plants, including the American partridge-berry (*Mitchella repens*). These are called dimorphic heterostyled plants.

Still more extraordinary is the case of the common loosestrife (*Lythrum Salicaria*), which has both stamens and styles of three distinct lengths, each flower having two sets of stamens and one style, all of different lengths, and arranged in three different ways: (1) a short style, with six medium and six long stamens; (2) a medium style, with six short and six long stamens; (3) a long style, with six medium and six short stamens. These flowers can be fertilized in eighteen distinct ways, necessitating a vast number of experiments, the result being, as in the case of the cowslip, that flowers fertilized by the pollen from stamens of the same length as the styles, gave on the average a larger number of capsules and a very much larger number of seeds than in any other case. The exact correspondence in the length of the style of each form with that of one set of stamens in the other forms insures that the pollen attached to any part of the body of an insect shall be applied

to a style of the same length on another plant, and there is thus a triple chance of the maximum of fertility. Some other species of lythrum, of oxalis, and pontederia, were also found to have three-formed stamens and styles; and in the case of the oxalis, experiments were made showing that crosses between flowers with stamens and styles of unequal length were always nearly barren. During these experiments twenty thousand seeds of *Lythrum Salicaria* were counted under the microscope. For several years a further supplementary series of experiments was carried out, showing that the seeds produced by the illegitimate crosses (as he terms them) were not only very few, but, when sown, always produced comparatively weak, small, or unhealthy plants, not likely to exist in competition with the stronger offspring of legitimate crosses. There is thus the clearest proof that these complex arrangements have the important end of securing both a more abundant and more vigorous offspring.

Perhaps no researches in the whole course of the study of nature have been so fertile in results as these. No sooner were they made known than observers set to work in every part of the world to examine familiar plants under this new aspect. With very few exceptions it is now found that every flower presents arrangements for securing cross-fertilization, either constantly or occasionally, sometimes by the agency of the wind, but more frequently through the mediation of insects or birds. Almost all the irregularity and want of symmetry in the forms of flowers, which add so much to their variety and beauty, are found to be due to this cause; the production of nectar and the various nectar-secreting organs are directly due to it, as are the various odors and the various colors and markings of flowers. In many cases flowers which seem so simply constructed that the pollen *must* fall on the stigma and thus produce self-fertilization, are yet surely cross-fertilized, owing to the circumstance of the stigma and the anthers arriving at maturity at slightly different periods, so that, though the pollen may fall on the stigma of its own flower, fertilization does not result; but when insects carry the pollen to another plant the flowers of which are a little more advanced, cross-fertilization is effected. There is literally no end to the subjects of inquiry thus opened up, since every single species, and even many varieties of flowering plants, present slight peculiarities which modify to some extent their mode of fertilization. This is well shown by the remarkable observations of the German botanist Kerner, who points out that a vast number of details in the structure of plants,

hitherto inexplicable, are due to the necessity of keeping away "unbidden guests," such as snails, slugs, ants, and many other kinds of animals, which would destroy the flowers or the pollen before the seeds were produced. When this evident principle is once grasped, it is seen that almost all the peculiarities in the form, size, and clothing of plants are to be thus explained—as the spines or hairs of the stem and branches, or the glutinous secretion which effectually prevents ants from ascending the stem, the drooping of the flowers to keep out rain or to prevent certain insects from entering them, and a thousand other details which are described in Kerner's most instructive volume. This branch of the inquiry was hardly touched upon by Darwin, but it is none the less a direct outcome of his method and his teaching.

But we must pass on from these seductive subjects to give some indication of the numerous branches of inquiry of which we have the results given us in the "Origin of Species," but which have not yet been published in detail. The observations and experiments on the relations of species in a state of nature, on checks to increase and on the struggle for existence,—were probably as numerous and exhaustive as those on domesticated animals and plants. As examples of this we find indications of careful experiments on seedling plants and weeds, to determine what proportion of them were destroyed by enemies before they came to maturity; while another set of observations determined the influence of the more robust in killing out the weaker plants with which they come into competition. This last fact, so simple in itself, yet so much overlooked, affords an explanation of many of the eccentricities of plant distribution, cultivation, and naturalization. Every one who has tried it knows the difficulty or impossibility of getting foreign plants, however hardy, to take care of themselves in a garden as in a state of nature. Wherever we go among the woods, mountains, and meadows of the temperate zone, we find a variety of charming flowers growing luxuriantly amid a dense vegetation of other plants, none of which seem to interfere with each other. By far the larger number of these plants will grow with equal luxuriance in our gardens, showing that peculiarities of soil and climate are not of vital importance; but not one in a thousand of these plants ever runs wild with us, or can be naturalized by the most assiduous trials; and if we attempt to grow them under natural conditions in our gardens, they very soon succumb under the competition of the plants by which they are surrounded. It is only by constant attention, not so much to

them as to their neighbors,—by pruning and weeding close around them so as to allow them to get a due proportion of light, air, and moisture, that they can be got to live. Let any one bring home a square foot of turf from a common or hill-top, containing some choice plant growing and flowering luxuriantly, and place it in his garden, untouched, in the most favorable conditions of light and moisture, and in a year or two it will almost certainly disappear, killed out by the more vigorous growth of other plants. The constancy of this result, even with plants removed only a mile or two, is a most striking illustration of the preponderating influence of organism on organism, that is, of the struggle for existence. The rare and delicate flower which we find in one field or hedge-row, while for miles around there is no trace of it, maintains itself there, not on account of any speciality of soil or aspect, or other physical conditions being directly favorable to itself, but because in that spot only there exists the exact combination of other plants and animals which alone is not incompatible with its well-being, that combination perhaps being determined by local conditions or changes which many years ago allowed a different set of plants and animals to monopolize the soil and thus keep out intruders. Such considerations teach us that the varying combinations of plants characteristic of almost every separate field or bank, or hill-side, or wood throughout our land, is the result of a most complex and delicate balance of organic forces—the final outcome for the time-being of the constant struggle of plants and animals to maintain their existence.

ANOTHER valuable set of experiments and observations are those bearing on the geographical distribution of animals and plants—a branch of natural history which under the old idea of special creations had no scientific existence. It is to Darwin that we owe the establishment of the distinction of oceanic from continental islands, while he first showed us the various modes by which the former class of islands have been stocked with life. By a laborious research in all the accounts of old voyages, he ascertained that none of the islands of the great oceans very remote from land possessed either land mammalia or amphibia when first visited; and on examination it is found that all these islands are either of volcanic origin or consist of coral reefs, and are therefore presumably of comparatively recent independent origin, not portions of submerged continents, as they were formerly supposed to be. Yet these same islands are fairly stocked with plants,

insects, land-shells, birds, and often with reptiles, more particularly lizards, usually of peculiar species, and it thus becomes important to ascertain how these organisms originally reached the islands, and the comparative powers different groups of plants and animals possess of traversing a wide extent of ocean.

With this view Darwin made numerous observations and some ingenious experiments. He endeavored to ascertain how long different kinds of seeds will resist the action of salt water without losing their vitality, and the result showed that a large number of seeds will float a month without injury, while some few survived an immersion of one hundred and thirty-seven days. Now, as ocean currents flow on the average thirty-three miles a day, seeds might easily be carried a thousand miles, and in very exceptional cases even three thousand miles, and still grow. Again, it is known that drift-timber is often carried enormous distances, and some of the inhabitants of the remote coral-islands of the Pacific obtain wood by this means, as well as stones fastened among the roots. Now, Darwin examined torn-up trees, and found that stones are often inclosed by the roots growing around them so as to leave closed cavities containing earth behind; and from a small portion of earth thus completely inclosed, he raised three dicotyledonous plants. Again, the seeds that have passed through the bodies of birds germinate freely, and thus birds may carry plants from island to island. Earth often adheres to the feet of aquatic and wading birds, and these migrate to enormous distances and visit the remotest islands, and from earth thus attached to birds' feet several plants were raised. As showing the importance of this mode of transport, an experiment was made with six and three-fourths ounces of mud taken from the edge of a little pond, and it was found to contain the enormous number of five hundred and thirty-seven seeds of several distinct species! This was proved by keeping the mud under glass and pulling up each plant as it appeared, and at the end of six months the result was as given above. It was also found that small portions of aquatic plants were often entangled in the feet of birds, and to these as well as to the feet themselves mollusks or their eggs were found to be attached, furnishing a mode of distribution for such organisms. Experiments were also made on the power of land-shells to resist the action of sea-water; and we have already referred to the observations on volcanic dust carried far out to sea illustrating the facilities for the wide extension by aerial currents of such plants as have very minute or very light seeds. This series of observa-

tions and experiments, supplemented by those of other observers, has been applied by the writer of this article to explain in some detail the remarkable phenomena presented by the distribution of animals and plants over the chief islands of the globe ("Island Life"). The facts are of a character so anomalous and apparently contradictory that, on the old hypothesis of the special independent creation of each species, no rational explanation of them could be found; and we may fairly claim that the clear and often detailed explanation which can be given by means of the theories and investigations of Darwin lend a powerful support to his views, and go far to complete the demonstration of their correctness.

Our space will not permit us to do more than advert to the numerous ingenious explanations and suggestions with which the "Origin of Species" abounds, such as, for example, the strange fact of so many of the beetles of Madeira being wingless, while the same species, or their near allies on the continent of Europe, have full powers of flight; and that this is not due to any direct action of climate or physical conditions is proved by the equally curious fact that such species of insects as have wings in Madeira have them rather larger than usual. Equally new and important is the Darwinian explanation of the form of the bee's cell, which is shown to be due to a few simple instincts which necessarily lead to the exact hexagonal cell with the base formed of three triangular plates inclined at definite angles, on which so much mathematical learning and misplaced admiration have been expended; and this explanation is no theory, but is the direct outcome of experiments on the bees at work, as original as they were ingenious and convincing.

We must, however, pass on to the great and important work, "The Descent of Man and Selection in Relation to Sex," which abounds in strange facts and suggestive explanations; and for the reader who wishes to understand the character and bearing of Darwin's teachings, this book is the fitting supplement to the "Origin of Species" and the "Domesticated Animals and Plants." To give any adequate account of this most remarkable book and the controversies to which it has given rise, would require an article to itself. We refer to it here in order to point out what is not generally known, that its publication was entirely out of its due course, and was not anticipated by its author three years before. In the introduction to "Domesticated Animals" (published in 1868), after explaining the scope of that work, he told us that, in a second work, he should treat of "Variation Under Nature," giving copious

facts on variation, local and general, on races, sub-species, and species, on geometrical increase, on the struggle for existence, with the results of experiments showing that diversity of forms enables more life to be supported on a given area, while the extermination of less improved forms, the formation of genera and families, and the process of natural selection, would be fully discussed. This work would have given all the facts on which Chapters II. to V. of the "Origin of Species" were founded. In a third work he proposed to show, in detail, how many classes of facts natural selection explains, such as geological succession, geographical distribution, embryology, affinities, classification, rudimentary organs, etc., etc., thus giving the facts and reasonings in full on which the latter part of the "Origin of Species" was founded. Unfortunately, neither of these works has appeared, and thus the symmetry and completeness of the body of facts which Darwin had collected have never been made public. The cause is well known to have been the continued pressure of ill-health. The work on "Domesticated Animals" was thus delayed many years, after which came the labor of bringing out a much enlarged edition of the "Origin of Species." The "Descent of Man" was, apparently, at first intended to be a comparatively small book, but a difficulty connected with the origin of the distinctive peculiarities of the two sexes led to an investigation of this subject throughout the animal kingdom. This was found to be of such extreme interest, and to have such important applications, that its development with the completeness characteristic of all the writer's work led to the production of two bulky volumes, followed by another volume on the "Expression of the Emotions in Man and Animals," not less instructive. None of Darwin's works has excited greater interest or more bitter controversy than that on man; and the correction of the numerous reprints, and of a final enlarged edition in 1874, was found to be so laborious a task as to convince him that any such extensive literary works as those projected and announced six years previously must be finally abandoned. This, however, by no means implied cessation from work. Observation and experiment were the delight and relaxation of Darwin's life, and he now continued and supplemented those numerous researches on plants we have already referred to. A new edition of an earlier work on the "Movements of Climbing Plants" appeared in 1875; a thick volume on "Insectivorous Plants" in the same year; "Cross and Self-Fertilization" in 1876; the "Forms of Flowers" in 1877; the "Movements of Plants,"

embodying much original research, in 1880; and his remarkable little book on "Earthworms" in 1881. This last work is highly characteristic of the author. In 1837 he had contributed to the Geological Society a short paper on the formation of vegetable mold by the agency of worms. For more than forty years this subject of his early studies was kept in view; experiments were made, in one case involving the keeping a field untouched for thirty years,—and every opportunity was taken of collecting facts and making fresh observations, the final result being to elevate one of the humblest and most despised of the animal creation to the position of an important agent in the preparation of the earth for the use of the higher animals and of man.

The sketch now given of Darwin's work is in many respects imperfect, since it has given no account of those earlier important labors which would alone have made the reputation of a lesser man. None but the greatest geologists have produced more instructive works than the two volumes of "Geological Observations" and the profound and original essay "On the Structure and Distribution of Coral Reefs"; while the numerous researches on the fertilization and structure of flowers and the movements of plants would alone place him in the rank of a profound and original investigator in botanical science; the most distinguished zoölogists and anatomists might be proud of the elaborate "Monograph of the Cerripedia," of which a competent judge says:

"The prodigious number and minute accuracy of his dissections, the exhaustive detail with which he worked out every branch of his subject—sparing no pains in procuring every species that it was possible to procure, in collecting all the known facts relating to the geographical and geological distribution of the group, in tracing all the complicated history of the metamorphoses presented by the individuals of the sundry species, in disentangling the problem of the homologies of these perplexing animals, etc.—all combine to show that, had Mr. Darwin chosen to devote himself to a life of morphological work, his name would probably have been second to none in that department of biology." ["Nature," Vol. 26, p. 99.]

Yet these works, great as is each of them separately, and, taken altogether, amazing as the production of one man, sink into insignificance as compared with the vast body of research and of thought of which the "Origin of Species" is the brief epitome, and with which alone the name of Darwin is associated by the mass of educated men. I have here endeavored, however imperfectly, to enable non-specialists to judge of the character and extent of this work, and of the vast revolution it has effected in our conception of nature,—a revolution altogether independent of the

question whether the theory of "natural selection" is or is not as important a factor in bringing about changes of animal and vegetable forms, as its author maintained. Let us consider for a moment the state of mind induced by the new theory and that which preceded it. So long as men believed that every species was the immediate handiwork of the Creator, and was therefore absolutely perfect, they remained altogether blind to the meaning of the countless variations and adaptations of the parts and organs of plants and animals. They who were always repeating, parrot-like, that every organism was exactly adapted to its conditions and surroundings by an all-wise being, were apparently dulled or incapacitated by this belief from any inquiry into the inner meaning of what they saw around them, and were content to pass over whole classes of facts as inexplicable, and to ignore countless details of structure under vague notions of a "general plan," or of variety and beauty being "ends in themselves"; while he whose teachings were at first stigmatized as degrading or even atheistical, by devoting to the varied phenomena of living things the loving, patient, and reverent study of one who really had *faith* in the beauty and harmony and perfection of creation, was enabled to bring to light innumerable hidden adaptations, and to prove that the most insignificant parts of the meanest living things had a use and a purpose, were worthy of our earnest study, and fitted to excite our highest and most intelligent admiration.

That he has done this is the sufficient answer to his critics and to his few detractors. However much our knowledge of nature may advance in the future, it will certainly be by following in the pathways he has made clear for us, and for long years to come the name of Darwin will stand for the typical example of what the student of nature ought to be. And if we glance back over the whole domain of science, we shall find none to stand beside him as equals; for in him we find a patient observation and collection of facts, as in Tycho Brahe; the power of using those facts in the determination of laws, as in Kepler; combined with the inspirational genius of a Newton, through which he was enabled to grasp fundamental principles, and so apply them as to bring order out of chaos, and illuminate the world of life as Newton illuminated the material universe. Paraphrasing the eulogistic words of the poet, we may say, with perhaps a greater approximation to truth:

"Nature and Nature's laws lay hid in night;  
God said, 'Let Darwin be,' and all was light."

Alfred R. Wallace.

## PARADISE REGAINED.

THE circling hills of woods and clouds snow-white  
Held, in the golden hour of eventide,  
The lake by which I walked, and seemed to hide  
From view a world yet lovelier, whose light  
Streamed up behind their heights and made them glow,  
As wrapped in purest flame, and flung on high  
Bright flakes of glory 'gainst the pale blue sky  
Which bridged with paths of light the lake below.  
I felt sweet music, that I could not hear,  
I saw a poem that I could not read,  
"What place is this," I cried! Lo, at my need,  
Two lovers passed,—'Twas *Paradise*! for clear  
I saw it shining in his happy eyes,  
I heard it murmur'd in her low replies.

Maria W. Jones.

## A LOOK INTO HAWTHORNE'S WORKSHOP.

BEING NOTES FOR A POSTHUMOUS ROMANCE,

BY NATHANIEL HAWTHORNE.

In the preparation of "Dr. Grimshawe's Secret,"—a novel by Nathaniel Hawthorne, which his son is about to make public,—Mr. Hawthorne seems to have written, in the way of notes and preliminary studies, enough matter to cover about sixty magazine pages, or in the neighborhood of one hundred and eighty pages of an ordinary book. He would then appear to have written out, or sketched out, more fully the main work,—but even the latter evidently failed to meet with his own complete approbation. How far the notes and preliminary studies were embodied in, or in any way used in, the main novel, we cannot tell, for we have not yet seen the latter.

The preliminary notes and studies for "Dr. Grimshawe" are in two different groups, of very different character. One group (in the possession of Mrs. Rose Hawthorne Lathrop, and now appearing in "The Atlantic Monthly") seems to consist of passages written out in narrative and dialogue form. Another group, of about equal length, consists of notes only. These last have been placed in our hands by Mr. Julian Hawthorne, with the privilege of using here a large part of the material. Beginning with the first of the notes, as he has copied them out, and going on to the end, we see the idea of an extremely striking and eminently characteristic romance growing to full proportions from the earliest and slightest suggestions. We not only see this, but we see it with an intimacy

that is fairly startling. These notes for "Dr. Grimshawe" furnish an actual vision of the minutest workings of Hawthorne's mind while engaged in the preparation of this book. It is as if the modern processes of instantaneous photography had been at that time fully perfected and brought to bear upon the very brain of the great romancer, while it was in its most rapid, at times even most furious action. It is a record of *everything* that was passing through his mind at the instant,—of deepest thoughts, of thoughts the most trifling and superficial. His most serious, and his lightest mood are chronicled with the same exact fidelity.

The record is of unique and incalculable value, because it is a complete revelation of the artistic principles and methods of one of the subtlest artists that ever lived. It is, in fact, a full and clear recipe for the making of a Hawthorne romance. "Something high and noble must be put into the man, together with morbidness and poison"—(that is a Shakspearean touch!). "Gather all sorts of picturesqueness about these characters and circumstances, and mystify about the old man and his spider." The Lord of Braithwaite Hall "must have picturesque characteristics, of course; something that fixes strange and incongruous necessities upon him, making him most miserable under a show of all possible glory and splendor and grace and gayety." "He might, as one characteristic, have an ice-cold right hand; but this should be only emblem-

atic of something else." "Do not stick at any strangeness or preternaturality. It can be softened down to any extent, however wild in its first conception."

In reading this unconscious record we are once more impressed by what we may call the mastery of Hawthorne over the situation,—with his deep ethical insight and the healthy cheerfulness of his mind while dealing with the most tragic and painful themes. He knows the artistic effect of the somber, but it must not be *too* somber. Elsie must glimmer "through the story, and illuminate it with a healthy, natural light."

The story is to open in America—in Charter street, Salem. Living together in the same house are the old doctor, with his gigantic and venomous spider, the boy Etheredge, who is to connect the American with the English part of the story, and the girl Elsie. In England there are the Lord of Braithwaite Hall, who is the Italian-English successor to the title, the old pensioner, who is the true heir, Etheredge grown to manhood, and others. In an early part of the notes, Hawthorne writes: "The great gist of the story ought to be the natural hatred of men and the particular hatred of Americans to an aristocracy; and, at the same time, doing a good degree of justice to the aristocratic system by depicting its grand, beautiful, and noble characteristics." Again: "It must be shown, I think, throughout, that there is an essential difference between English and American character, and that the former must assimilate itself to the latter, if there is to be any union."

We leave untouched the very interesting first half of the notes (except for the few words quoted in the preceding paragraph), and, beginning about the middle, give our readers (with two slight omissions) all of the last half of the series.

*Editor of The Century Magazine.*

THIS wretched old pensioner keeps recurring to me, insisting that I have not sufficiently provided for him, nor given him motive enough—or any, indeed. At present, therefore, the stubborn old devil will not move. Take him at his death-hour, and work backward from that. He has been smitten with death in the old manor-house, surrounded by Etheredge, Elsie, the Warden, the Italian-Englishman, and other personages of the drama. The scene takes place in the stately hall of the mansion, surrounded by antique associations of arms or furniture, carvings, etc. The old man, as his last moment draws on, becomes invested with a strange aspect and port of dignity and majesty. At the same

time the development of the plot is taking place. Up to this hour, the probabilities have seemed to strengthen that Etheredge is the heir of the estate and name; but, at the very last, a slight circumstance shall be counter-changed, which shall at once make it evident that the old pensioner is the true heir, and the spirit of his ancestors shall display itself. \* \* \* He may be a sort of reformer, whose principles are entirely against hereditary distinction. The object of the book, to find the treasure-chest, which the silver key found in the grave-yard will suit. This at last turns out to be the coffin of a young lady, which, being opened, it proves to be filled with golden locks of her hair. But this quest must be merely incidental. Under the hair, or upon it, is a roll of obliterated writing. This nonsense must be kept subordinate, however. 'Twont do. Crambo, Mary Mumpson, Cunk, Miss Blagden, Miss Ingersoll, Mr. Roberts, Marshall Rynders, President Buchanan of this United States. \* \* \*

Take the old man from his earliest original: the family name had been changed in America; his ancestor was the second son of the old family, and was thrust out of the paternal mansion; there are conflicting testimonies wherefor. One account says that he was a wild and bloody religionist, and, with his own [hand], beheaded the king, and got the bloody footstep by treading in a pool of his blood on the scaffold. Another account bears that he was a Quaker, or somebody on the George Fox principle; and that his bloody footstep came from his being violently and wounded thrust from his paternal home. Others say it was of much earlier time. Well, this race turns up in America with some vague traditions among themselves of their descent; they are not Quakers; at least, have ceased to be so long before the epoch of this story; but still something of the spirit of their peaceful ancestor has remained in them throughout this length of time. They keep up their traditions. At length there is born an imaginative one, who marries early in life, and loses his wife; his affections being thus balked, he leaves his son under the charge of a friend (the Doctor), and goes to England to enter upon a quest into his lineage. He becomes slightly insane, and, getting more and more engaged in this delusive enterprise, he remains abroad all the rest of his life, in poverty, in solitude; meanwhile his son has grown up, married, and left a daughter, whom the Doctor has taken charge of. On the Doctor's death, he divides his property between the girl and Etheredge; and the girl, as soon as she is at her own disposal, comes

abroad in quest of her grandfather, to whom the Doctor's papers have given her a clew.

The Doctor, an old, humorous bachelor, had likewise adopted another child, a boy, who struck his fancy in an alms-house, whither he had come, attended by an old woman. He does this partly because the name is that of the family to which his friend really belonged. This boy is really the descendant of the third son of the old family, but he imagines himself to be the descendant of the old bloody footstep man, in respect to whom he adopts the wicked version of the story. He also has inherited traditions of noble descent, together with certain documents, which carry proofs of his birth far upward to the original emigrant, who really came over in quest of his lost brother, because he is penitent for his treatment of him, or because, from some family arrangement, it was necessary to find him. But he met with impediments, such as being carried away by the Indians, etc., and ultimately settled in Virginia, whence the family emigrated to New England. Before he goes to England (the present representative I mean), he gets his pedigree authenticated, showing, through all vicissitudes, that he is descended from the second brother. This he holds in his possession, and is ready to display it on occasion.

Meanwhile, the family in England is represented by a descendant of the youngest brother. There have been traditions of other heirs; and messengers, at various times, have been sent over to America in quest of them, and in hope to find that there were none now existing. Also, by the [ ] of the family, there is an old custom of keeping a place at the family board, and a bed-chamber ready.

The old man? Yes! I cannot consent to such a degradation of his character as is implied in his seeking the estate and title. He must all along have been conscious that it was his right; but a peculiar philosophy has taught him that he must not take it. No, there must be some specific cause; a curse, for instance, imposed upon his race if they ever assert their right. Why? Something that should have made his rank and station hateful to him—that might be; but how might that hate-feeling be continued to his descendants? So that they should prefer poverty and obscurity to name and high position. True. This pensioner is the first one, for two centuries, who has known of his descent; the knowledge of it came to him through the Doctor's researches, and he went to England to investigate it, with a desire to know his relatives and hereditary seat, but not to claim them. The Doctor must have a great agency in these doings, both of the pensioner and

Etheredge, making tissues of cobweb out of men's life-threads; he must have the air, in the romance, of a sort of magician, without being called so; and even after his death, his influence must still be felt. Hold on to this. A dark, subtle manager, for the love of managing—like a spider sitting in the center of his web, which stretches far to east and west. Who is he then? What interest had he in this? Some speculative and philosophical interest, if any, and he dies before it is gratified. I doubt whether 'twill do, but his enterprises go on after his death, and produce strange effects without him to control them. He shall have stretched out his hand to England, and be operating there, making people his puppets who little think they are so. He must have traveled over England in his youth, and there have fallen in love and been jilted by a lady of this family; hence his spite against the family, and his determination to ruin it. He shall have sought out, with all his might, an heir, and educated Etheredge for that purpose. There may be a germ in this—I don't know. Perhaps the Doctor himself might be an English misanthrope, who had a spite against this family. He must be somebody who knows all about the English part of the family; and he has some plot against them in full concoction, calculated to take effect years hence, when he suddenly dies (perhaps of the poison of his great spider), and leaves his plot to operate as it may, by itself. Make his character very weird indeed, and develop it in dread and mystery, with as much of the grotesque as can be wrought into it. He may himself be a member of the family—possibly the heir. He shall have meant Etheredge as his tool, certainly; but, in the end, he shall prove to have no ancestry,—an American son of nobody, evolving the moral that we are to give up all those prejudices of birth and blood which have been so powerful in past ages; at any rate, there shall be but vague reasons to believe that Etheredge is of that descent, and it shall be a rebuke to him for giving up the noble principle that a man ought to depend on his own individuality, instead of deriving anything from his ancestors. The pauper must be the true heir. Then why should not the Doctor have made him out to be so? True. He shall have made a mistake, owing to his lack of acquaintance with the traditions of this pauper, with whom they shall have been a family secret; but his interest and imagination shall have been awakened by what the Doctor said, so that he shall have gone to England to investigate the matter. It is a snarled skein, truly; but I half fancy there is a way to unravel the threads, by dint of breaking one or two.

The lady whom the Doctor loved shall have died; the Doctor shall have treasured up a single lock of golden hair, which Etheredge, from some fanciful reason or other, brings with him to England. On opening a coffin with the silver key, it shall prove to be quite full of these golden locks, with the same peculiarity as this. The owner of the estate shall have betrayed the Doctor, and won his lady's love from him; so he, brooding along, shall have resolved to avenge himself in this way. The coffin, full of golden locks, shall be a symbol that there was nothing in this woman—nothing of her but her golden hair and other external beauty, and that a wise man threw himself away for that emptiness. He may himself (the Doctor) have been the proprietor of the estate. How?—why?—what sense? He shall have been at deadly enmity with the holder of it, and, being a wicked man and unscrupulous, shall have contemplated these means of avenging himself. Long after his death, Etheredge shall have found the papers which seem to him to prove his claim.

The great spider shall be an emblem of the Doctor himself; it shall be his craft and wickedness coming into this shape outside of him; and his demon; and I think a great deal may be made out of it. This shall be his venom, which has been gathering and swelling for thirty years; for, in all that time, those who knew the spider and the Doctor earlier, shall have seen the one was growing more swollen with spite, and the other with venom. It must be an unsuccessful and ill-treated passion that first caused this: he having loved the woman whom Braithwaite won from him and married. He shall have known the family tradition that there was an heir of the estate and title extant in America, and shall set out with the purpose of finding him. Then, when he cannot find out this heir, he bethinks himself that it will be yet sweeter revenge to substitute some nameless child for this long-descended heir; and looking about (being an unscrupulous man), he finds this boy, three or four years old, in the alms-house, without parents, of untraceable origin. Him he takes, educates, and the love that there is in him grows to this child and expends itself all on him.

Now, as for the girl? Shall she also be a *filia nullius*? or his own daughter? or a granddaughter of the pensioner? We must have her, and she must have a right in the book. Shall she be a niece of his? Well, she need not be very rigidly accounted for, but may have been consigned to his care, as the last remnant of his own family, the child of a younger sister. So he shall have taken her, perhaps not loving her as his wayward nature does the boy, whom he will feel as if he had

made with his own art and skill,—but still tolerating her in his house.

Now, the pensioner. He may have been, originally, a New England minister, or a religionist of some sort, who had an early dream of founding a sect of his own, deeming himself to have had a revelation. Or, being of a religious nature, he may have had a tradition in his early days, of a person in his family, long ago, who was of a most pious nature; his life and footsteps he shall have sought out, and this search shall lead him in the track of the bloody footstep; following which, he shall be led across the sea, and to the old mansion-house. There shall be a peculiar odor of sanctity for him in the spot where this saint and martyr was born and bred, and so he shall haunt around it, knowing of his claims, but entirely above asserting them,—at least, aside from them. All along he shall have in his possession the one thing that can prove his descent. What can that be? Some traditionary secret that explains a mystery which has been mysterious for two centuries. The unlocking of some door that had been locked for centuries. Some coffer? Could it not be contrived to have some antique, highly ornamented coffer treasured up in the old house, under the idea that it contained something of fatal importance to the family? It shall have two locks; one the pensioner shall have, transmitted from his ancestors; the other shall be the one that Etheredge found by the grave. On opening the coffer, it shall prove to be full of golden hair; for it was the coffin of a beautiful lady, who, by that strange process, has turned all to that feature by which she lives in the family legend. The New England Government shall have prosecuted the first emigrant, as being a non-conformist to their creed; possibly, they may have hanged him, though I hardly think so. Yet, if it will produce any good effect, hanged he shall be. What can he have had to do with the key of the lady's coffin? She must have been murdered then? It shall have been supposed in the family that she disappeared with him, as she disappeared about the same juncture. Well, this mystery might be left to conjecture, without being definitely solved. It shall explain why the lady never appeared again, certainly. The lady had been beloved by two brothers, and had loved the bloody footstep man; the other one had murdered her, and deposited her in this antique coffer, which was deposited in a secret chamber. At any rate, somehow or other, she shall be repositied in an antique coffer, or, it may be, in an old stone coffin; I think the former, because of the silver key. The lady being murdered, the

elder brother, in horror, shall flee. No; perhaps the brother shall mean to murder him, and shall thrust him out of the mansion with that purpose,—he, and the younger brother,—and shall leave him for dead; but he shall be conveyed away. The place where his body shall be thrown shall be the very one where Etheredge was shot down on his first arrival; and he shall afterward dreamily recognize it by a description in the Doctor's story. There must be discrepant traditions about all these things; the pensioner having one side of the matter, and the Doctor, as derived from the family in England, the other. Perhaps it is after the death of the lady that he turns religionist, gives up his rank, disappears from England, taking the key of the coffer with him, and leaving the dead body repositied there. He may have killed the lady out of jealousy, and gone off, taking their child, a boy, with him, and have spent the rest of his life in penitence and humble strivings for heaven; dying by the executioner in New England, not for his crime, but for his religion. The ensuing tradition in his family shall have turned aside the truth of his bloody footstep, which shall have been dyed in the blood of his wife. They shall think that he took his wife with him. Here is reason enough for his deserting his home, extinguishing his name, and becoming a wild religionist. But there shall have been kept in the family an ancient document, in his writing, telling of these things, in some of them—telling of his birth; yes, telling of all, by which the pensioner shall know it; and shall know of the coffer, and shall have one of the keys of it, the other being the one that Etheredge has brought. Hammond, the agent of the old Doctor, shall be the one to discover, from his intimacy with the Doctor, the truth that Etheredge is not one of the old family, but a son of nobody, with all the world for his ancestry.

To-morrow, arrange the chain of events.

Open in the old house in Charter street; describe it and its surroundings in a somber, grotesque kind of way. The old gentleman in his study, amid his spiders, must be first touched upon; especially the gigantic spider, to which (quietly and without telling the reader so) ascribe demoniac qualities. Relieve the gloom by resting a little upon the beautiful boy and the cheerful girl. An old woman (Hannah Lord, perhaps) must be the only other member of the household. Perhaps, however, an English man-servant. The old gentleman is known as the Doctor by the town, although he never practices physic; only he is thought to be learned and scientific, and he has this theory about cobwebs—which it shall be uncertain whether he is not

laughing at the world in it. Tell how he has found the boy in the almshouse; for some reason has adopted him—which reason seems to be that he knows him to be the heir of an old family in England. Without directly telling the boy that he is the heir, he shall be in the habit of telling him stories about this family. He educates him in all gentlemanly qualities, teaches him fencing, gives him thorough classical teaching. He must be represented as acquiring a vast affection for the boy,—passionate, engrossing, more than if he were his own son; because of the peculiarity in the way of acquiring this child, it shall seem as if he had made him—he shall combine himself (the boy shall) with his intellectual purpose. Something high and noble must be put into the man, together with morbidness and poison. The boy shall get good and evil from him; growing up proud, ambitious, passionate; the girl shall be the redeeming character, and a gentle light in the house,—yet not too gentle either. She is a relative of the Doctor, who was brought to him a child of three years old, by an Englishman, who departed immediately—perhaps by somebody who died, and lies buried near the house. Early in the romance, introduce the story of the bloody footstep. Gather all sorts of picturesqueness about these characters and circumstances, and mystify about the old man and his spider. The reader must see reason to doubt very early, or to be puzzled, whether or no the boy is the heir; and his mysterious origin must be so handled as to leave it uncertain whether the devil has not something to do with him. The girl's character must be imbued with natural sunshine, which will [seem] queer from its being natural.

When the romance is fully imbued with all this, introduce the visit of the Englishman. He must be an agent and old friend of the Doctor's,—a man of business, an attorney, I think. He must still further mystify the matter. He shall talk about the fears and expectations in the English family of an heir; the rumors they have heard; and of some old document that has been discovered, about something that was hidden in the grave of the first emigrant, that contains something necessary to the development. So there shall be the scene of opening the grave, in the winter-time, as before. His demeanor toward the boy, and some words that fall from him, shall stealthily indicate, yet leave in doubt, the Doctor's whole doings in this matter. Some light, too, should be thrown on the Doctor's wrongs, which have induced this curious project of revenge.

Something must be brought to the reader's notice, even earlier than this, about the old

pensioner, though I do not see how. Perchance a religious character shall see the boy and girl together, and bless them, and make some allusion to the family history, being incited to this by the name which the old Doctor has given the boy. Something in this man's presence—something holy and beautiful, apostolic, religiously noble—shall touch the boy, and remain in his memory through life. Perhaps the old Doctor should be present, and take some part in the conversation; he shall not know the religionist, but something shall pass which shall indicate that the apostle knows something about the family history, though he and the Doctor shall not understand one another.

Matters being sufficiently in train, the Doctor dies unsuddenly, and, it is suspected, by the bite of his great spider, who, being the devil, has probably got his soul. His death-scene shall make it appear that he had something on his mind which he had half a mind to reveal; but yet he could not bear to give up a revengeful purpose of many years; neither, at the moment of death, can he do what remains needful toward carrying it into execution. There is, therefore, a portentous struggle and uncertainty, which shall much increase the mystification of the plot. It shall be mentioned, however, that his will makes Etheredge inherit an amount of property sufficient to educate and establish him in America; there is likewise provision for the girl; and here ensues an interval of perhaps fifteen years. There are among his papers much that seems to indicate Etheredge's heirships, pedigrees, genealogies, coats-of-arms, what seem to be authenticated proofs of American descent, but nothing absolutely proved.

The curtain next rises in England. It should be added to the last preceding part that more than one messenger came from England making inquiries which seemed to have reference to the heirship of the estate; for the branch of the family heretofore in possession had died [out], and a new heir had to be looked for, both for the estate and a dormant title. This heir shall have been found in a branch which had emigrated with the Stuarts, and become Italianized. This man, somehow or other—it need [not] be exactly indicated how—had got notice of Etheredge's arrival in England, and shall suppose it is to assert his rights. He procures him to be dogged in his wanderings, and, finding that he comes to the estate, he hires (Italian fashion) an assassin to murder him on the precincts of the estate, in some place that shall have been described by the Doctor in his story. The old pensioner rescues him or finds him bleeding, conveys him to his apartments, where Eth-

eredge vaguely recognizes the holy presence that has never quite died out of his memory. Much suggestive conversation may ensue between them, at various times, mystifying, enlightening. Then the Warden is introduced, and Etheredge is taken into his house, as before. From the antiquarian and genealogical disclosures of the Warden, the books in his library, and a variety of ingeniously arranged circumstances, Etheredge is more and more confirmed in the idea that he is the heir. Yet various recollections of something ambiguous in the old Doctor's conduct, and of his dying scene, shall make him hesitate to assert himself, and so shall his democratic education and pride. He shall meditate making a confidant of the Warden, but shall hesitate, on account of the latter's position in respect to the family. Hammond, the Doctor's old agent, appears, and his demeanor shall throw Etheredge into still greater perplexity; although it is possible that Hammond must more than strongly suspect the Doctor's fraud. Possibly he may hint that money is necessary. He must startle Etheredge with the dread of something dishonorable.

There must be various interviews with the girl, who has come back to England, and is living in respectability on what the Doctor left, in a poor way,—perhaps as governess, or lady's gentlewoman. Perhaps the Italian heir is in love with her.

Then ensues the Warden's grand dinner, where Etheredge (now made an ambassador) is the principal guest; and here he meets the Italian heir, who recognizes him as perhaps a relative (from his name), and invites him to the hall. Etheredge accepts the invitation and goes thither; and here ensues, in the romance, much description and talk about old English dwellings, and the difference between English and American social life; how we have given up certain delightful possibilities forever, and must content ourselves with other things.

Meanwhile the Italian shall have made a plot to poison Etheredge, believing him to be truly the heir; for perhaps Hammond may have played him false and betrayed his project, and it will be policy to murder him before he takes any public steps. Just at that time poison was as fashionable in England as it had ever been in Italy. This somehow comes to the knowledge of the girl, who tells it to the old pensioner, who interferes to prevent it. He comes to the Hall and is admitted, he being known to the heir as one who has much knowledge of the genealogy; then he takes state upon himself, announces himself as the American heir, so long expected [and], produces his proofs. At the same

time Hammond appears with his evidence of the Doctor's revengeful purpose, and Etheredge finds himself at once deprived of all kindred, and left in a truly American condition. The pensioner declines to take advantage of his rights. The Italian is rejected by the girl; she is left [to] be the consolation of Etheredge. Something more tragical than this must be contrived; the death of the Italian, I think. He cannot comprehend the generosity of the pensioner, and drinks off the poison which he has prepared for Etheredge; so that the pensioner shall be a lord in spite of himself, which he must take very quietly.

I think, before this denouement, the owner and Etheredge might be strolling through the house, and come to the great black coffer, about which there must have been traditions. He opens it with the silver key, and finds there the hair. This the more confirms the Italian in the belief that Etheredge is the heir.

The girl, I think, shall have a sense of something false and wrong in Etheredge's claim to the estate, etc., and shall endeavor to persuade him to relinquish it. Some great misfortune shall impress her as having to be the result. The shadow of the old Doctor must be so contrived as to fall over all the subsequent part of the romance, after his death; so that he shall still seem to darkly live and act, though his revenge is balked.

We must begin at the source. What was the motive of the original emigrant in leaving his inheritance, coming to America, and secluding his identity from the knowledge of anybody? Well, thus: before the civil war, this personage was living in great happiness with his young wife, in his ancestral mansion; but, being incited to jealousy (whether truly or falsely, need not appear), he is supposed to have killed his wife and reposed her in a very curious old coffer, in a hiding-place of the mansion. He retains one lock of her golden hair to remember her by. He takes his boy with him, and goes forth from his mansion, leaving the blood-track on the threshold. He goes to New England, and there lives in seclusion, yet must provide in some way for the ascertaining of his identity after two hundred years. How? He leaves a narrative in a paper, which is preserved, and gets into the hands of the old Doctor. Meanwhile, the family in England do not know the truth of the story, nor what became of either husband, wife, or boy; though, in some inscrutable way, a legend is propagated that they fled to America, and that there is left behind a coffer full of gold, buried somewhere about the house.

One of the legends about this first emigrant shall be that adopted by the English family,

and related in the Doctor's legend of the bloody footstep. This shall represent him as a blood-thirsty man, whose foot has been wet by his king's blood.

Another shall be that of the pensioner, representing him as a saint. This shall have so much of truth in it, that he did, in New England, become a wild religionist, found a sect, and suffer death for non-conformity. The pensioner shall have taken up his religion, and become a preacher of it; but, it having been adapted to another state of the world, he has no success, and finally comes to the hospital. There has been handed down to him a tradition that he belongs to this family, and, out of a pious reverence for his ancestor, he has sought out the proofs of his descent, and has them with him. The name has been changed; but there shall be an authentic certificate of old date, as to this change of name, which saves the old pauper's rights.

Etheredge, on the other hand, must have a series of seeming proofs, contrived by the Doctor, for the purposes of revenge; they should seem to strengthen at every step, and become indubitable; but, at the very last moment, most unexpectedly, they should crumble into nothings. Etheredge must discover, by means of Elsie, that the Doctor had contrived this plan. He had revealed this on his death-bed, and given her a paper, signed and certified, which she was to produce on occasion; but he could not bring himself to blacken his memory with Etheredge, whom he loved so well, by revealing it sooner. He was in hopes that Etheredge would never really take up the claim. At the last moment Elsie delivers the paper, of which she herself does not know the contents. It produces a violent effect on Etheredge, but he honorably resolves (when the prize seems actually within his grasp) to relinquish it.

The Doctor shall have supposed the genuine race to be extinct, and, under this idea, shall have no hesitation in availing himself of proofs of descent which really belong to the pensioner. But Etheredge shall see reason to suppose that he is the real man; and shall declare it, and assign over to him the proofs that he has heretofore thought made out his own claim. The old man must have no suspicion, I think, of the truth. The Warden shall have communicated to Etheredge, perhaps, the nature of the proof which the old man has made out in order to entitle him to the benefit of the hospital; up to a certain point, it makes out his claim, and then the old Doctor's proof joins on to it, and shows him to be the heir. One branch of the American descent had become extinct; this the old

Doctor finds out, but is not aware that another branch is represented by the old pensioner.

THE life is not yet breathed into this plot, after all my galvanic efforts. Not a spark of passion as yet. How shall it be attained? The Lord of Braithwaite Hall shall be a wretched, dissipated, dishonorable fellow; the estate shall be involved by his debts, and shall be all but done up. He shall (perhaps) be in love with Elsie. Up to his death he must feel as if this American had come to thwart him and ruin him in everything, and shall hate him accordingly, and think he is doing well to kill him, if possible. This wont do; some marked character must be given to this fellow, as if he were a fiend, a man sold to the devil, a magician, a poison-breather, a thug, a pirate, a pickpocket; something that will look strange and outré in that high position; it must have picturesque characteristics, of course; something that fixes strange and incongruous necessities upon him, making him most miserable under a show of all possible glory, and splendor, and grace, and gayety. Could I but achieve this, I should feel as if the book were plotted otherwise, not. Something monstrous he must be, yet within nature and romantic probability—hard conditions! A murderer—'t wont do at all. A Mahometan—pish! If I could only hit right here, he would be the center of interest. It will not do to have him a mere lay-figure: there might be good and evil in him. Something most abhorrent to the English he might be—as, for instance, a partaker in the massacres of India, a man bedaubed all over with the blood of his own countrymen. A moral of the strange things that happen when the accident of birth puts people into places for which they are most unfit. Nothing mean must he be, but as wicked as you please. Shall he be preternatural? Not without a plausible explanation. What natural horror is there? A monkey? A Frankenstein? A man of straw? A man without a heart, made by machinery?—one who has to wind himself in order to go through the day? Wicked as he must be, there shall still be relations between him and the pauper saint. What? Shall there be an influence in the house which is said to make everybody wicked who inherits it? Nonsense! Remorse it must not be. A resurrection-man? What? what? what? A worshiper of the sun? A cannibal? a ghoul? a vampire? a man who lives by sucking the blood of the young and beautiful? He has something to do with the old Doctor's spider-theory; the great spider has got him into his web.

The Doctor, before he left England, had contrived a plot of which this man is the victim. How? He has been poisoned by a Bologna sausage, and is being gnawed away by an atom at a time. He shall need a young life every five years, to renew his own, and he shall have fixed upon Elsie for his next victim. Now for it! How? At any rate, he must have dreadful designs on Elsie—dreadful! dreadful! dreadful! May it not be that the revenge of the Doctor has fallen on him? No, no! Let the real difference between him and other people be very small, but pile up upon it! Ye Heavens! A man with a mortal disease?—a leprosy?—a eunuch?—a cork leg?—a golden touch?—a dead hand?—a false nose?—a glass eye? The rumors of his devilish attributes may be very great; but the circumstance itself may be comparatively trifling. Some damn'd thing is the matter. The last survivor and inheritor of an otherwise extinct society of crime. He was initiated in Italy; all his companions have died by the executioner, and he alone escaped. A Rosicrucian. A Cagliostro?

This wretched man! A crossing-sweeper?—a boot-black? He comes of a race that is degenerate in a certain way; rotten, yet retaining a brave outside. How? It should be from some cause that had existed in the family for hundreds of years. It can't be. Some irremediable misfortune has got possession of this poor devil, and makes him an object of pity as well as horror. He has yielded to some great temptation, which particularly besets the members of his family. The unpardonable sin. He has looked into a Blue-Beard chamber. He had murdered, by slow poison, the former possessor of the estate; he had buried him in a niche. 'T wont do. His forefather emigrated to the continent with King James, and settled in Italy, where he lost entirely his nationality, and gave origin to a race of nondescripts. Upon this race was engrafted something that is proper enough to Italians, but becomes monstrous in Englishmen. Some one trait there must be that produces this terrible and weird effect. He might, as one characteristic, have an ice-cold right hand; but this should be only emblematic of something else. He is in the habit of doing something horrible every day, which his previous life has made necessary to him. He might have a scar, which, in circumstances of desperation, grew blood-red. He may have done something, in this generation, which his ancestor had done in a former one. What? This is a very hard pinch. His icy hand—what it may betoken? That, on some occasion, he has done a deed with that

right hand which has driven the genial warmth out of it. The English shall hate this man, apparently because of his foreign birth and peculiarities; but really there must be something repulsive about him. What? The stench of a crime? The silent influence of hateful qualities? What habit can he have? Perhaps that of having a young child, fricasseed, served up to him for breakfast every morning. Some strange East Indian habit he may have adopted; and his unpopularity shall be an example of English prejudice. Do not stick at any strangeness, or preternatural-ity; it can be softened down to any extent, however wild in its first conception. He may have had a taste of blood, and now feel a necessity for it—having poisoned people, or stabbed them with a poisoned dagger. His crime gives him an atmosphere disagreeable to other people; but he himself does not suffer from it, except as it has made a necessity for him to have the luxury of committing crime still. In his Italian poverty he was reduced to great extremities, and found it needful to consort with certain great criminals, amongst whom he had a taste of crime, and found it racier and more ravishing than anything that virtue could supply. He was a member of Italian banditti. He was an executioner, being of a cruel nature, so that he served an apprenticeship to Calcraft, or was an amateur assistant of him. He has been reduced to the dregs of life; had lived in a cellar, on offals. Alas me! Virtuous, beautifully behaved, he may be in all respects except one, which shall throw a devilish aspect over him, and make the whole romance wild and weird. How? how? how? The key of the romance ought to be here, in this one little peculiarity; so it must have reference to the past. It must be something that he can't help doing; some one trait of insanity. He drinks blood. He has a person concealed. No, it must be a great trait in his nature, coming from the past, in his blood. Pshaw!

This wretched man, still. A great pride of birth he must have, at bottom, vile varlet as he is; and yet he has been raked from the very kennels of dirty crime. In Italy, he has lived upon olives, figs, cheese; has wrapped his cloak about him in those keen Roman winds; has wept, has grieved, has suffered, through all that sordidness, till suddenly raised to this delightful position. Once he had a great temptation to do a horrible thing. Of course he yielded. Agreeable, brilliant, witty, but heartless and worthless—a man of the world. All this amounts to just nothing. I don't advance a step. He lives a solitary life. They avoid him. Why? Partly because they don't like him. Yet he should have companions,

methinks. No, only now and then a fellow as questionable as himself. He is one of those characters that only opportunity draws out, like the monsters that came to the surface of society during the French Revolution; else hidden through the quiet centuries. What monsters of men have there been? Raised to this high seat, there must be some vile peculiarity which he has brought with him, and cannot keep down entirely. It will, once in a while, have its gratification, though, as a general thing, his manners are unexceptionable. It might be derived from his Italian blood. If he could only get rid of this propensity, he would be a perfectly unexceptionable man. He struggles for it, but in vain. Elsie, perhaps, is in his secret, and wishes to help him. He fails; she fails. A propensity for drink? A tendency to feed on horse-flesh? A love of toads? A badge of the mud that has clung to him in the depths of social degradation in which he has been plunged? Surely, there is some possible monster who would precisely fit into this vacant niche. The girl must, somehow, have a close relationship with him. He shall love her; be capable of being redeemed by her. She knows this, and hesitates to let him fall. Finally, she is compelled to do so by the wild surge of his wickedness. Amen! The thing? The thing? Something derived from old times this peculiarity ought to be, carried to Italy, there fostered into something monstrous, and brought back to England. What? The old bloody footstep business? No, that wont do. But there must be something definite—no vague assemblage of characteristics. Widen the sweep of the net a little. Shall he be an impostor? No! What fantastic, yet real-seeming peculiarity can he have? Supposing him to have once tasted blood, and got an appetite for it—how? But that is vulgar. I think the family history must take hold of his evil imagination, and invite him to crime by the pestilence and contagion of a crime long past, which is dug up again and pollutes the moral air, as did the bodies dead long ago of the plague pollute it physically. 'T wont do. The union of British brutality with Italian subtlety has produced a refinement of wickedness. Emblemized, how? and how made picturesque? This is despair, sure enough. Miss Mackintosh. McIntosh. James McIntosh, Esq. I can't see it. Nobody knows what his former life had been, though there were dark hints about it; that it had gone very low—into the kennel, even. But, if so, nothing of it was perceptible in his manner. His mother was a low Italian woman. She was now dead, though he was still young. He had come forward without

any vouchers for his former character, though with ample proofs of his being the heir of the family. He shall have inherited from his mother the old art of poisoning, and shall be in the habit of poisoning people for his private amusement, and experimentally. 'T wont do, of course. His character must be evinced in the course he takes with Etheredge, after getting him into the house.

HERE I come to a stand-still! What does he mean to do with Etheredge, having now got him into his house? To poison him? 'T wont do. To produce some effect on his mind, by means of spiders, and bookworms, and works of natural magic? I don't see the *modus operandi*. There might be an auction in the house, or preparations for one; and then there should be a general rummage. Or there might be repairs going on, because parts of the house are ruinous and leaky. In either of these ways, the old cabinet may be found out. Or the priest and he, forming a friendship together (which may be cordial and sincere, or otherwise), the former, who is in all his lordship's secrets and has discovered some for himself, lets him into one which he has discovered in his own apartment. It is a secret repository adjoining his room, in which is the cabinet. No; the old pensioner is, on some occasion, brought to the house, where he tells, behind a panel in this room is a secret place, which he points out, and within it is this coffer, made of oak, or bronze, or what not. Well, all that nonsense might be easily enough arranged; but what is his lordship, and what is he to do? He is a member of a secret society in Italy, who have a hold upon him, which they strenuously assert; and he thereby becomes most miserable. 'T wont do. He has a secret ulcer. Bah! What does he do? He makes a soup for Etheredge out of the bones of his long dead ancestors, spiced with the embalming out of the bowels of one of them, and he himself partakes. Very well. Oh, heavens! I have not the least notion how to get on. I never was in such a sad predicament before. The old family, as far as refers to his lordship's ancestors, was effete; then came a vein of wickedness in, making him cunning and crafty, which he is beyond the depth of most men. There has been a spider's web woven of old which inwreathes all who come near it; and the great spider is the emblem of the person who did it. How can this be? The priest finds the spider and takes up the plot. The spider's web must be a sort of chorus to the drama that is going on, reflecting it—a new spoke and complication of the web, continually corresponding with every new devel-

opment. From a life of petty meannesses and shifts, he has come into this high position. And he brings one thing with him—one chain attached—which threatens to throttle him, being about his neck. Oh, fie!

Now, here. The old Doctor's spider's web must, of course, have a signification. It signifies a plot in which his art has involved the story and every individual actor. He has caught them all, like so many flies; nor are they set at liberty by the death of the magician who originally intralled them. This is good as an unshaped idea; but how is it to be particularized and put in action? Thus, for instance: it must be an ancient story, certainly; something coming down from the days of the bloody footstep—some business which was left unsettled by the sudden disappearance of the original emigrant to America. It must relate to property, because nothing else survives in this world. Love grows cold and dies; hatred is pacified by annihilation. It might, indeed, have reference to the title. Perhaps it may. Could there be a document, a secret, somewhere in the old house, which each succeeding heir reads, and is immediately smitten with [the] insane [purpose] to achieve or obtain something there written and proposed? What? It refers to a treasure of the family, buried in a certain spot. That'll not do. No; we must get out of this idea. It awakens an unhallowed ambition and madness of lust for something that ought not to be—cannot be possessed. It speaks of a great beauty to be won, and she is found in the old coffer. It must be a mere delusion.

The Doctor must then have an agent in England. This is Mountford, who has been taken possession of by the subtlety and force of the Doctor's character, and continues to do his will even after he has been dead twenty years, for he had laid a command upon him. He has, therefore, a constant agency in all that takes place, or is hereafter to occur, in the English scene. Mountford must be an attorney in the vicinity of the Manor House. He is crafty and ingenious, but has not strength of mind, and has been subjected of old to the power of this old man, who knew some peccadillo of his, and took advantage of it thoroughly to subdue him. The Doctor had a deep purpose of revenge to subserve, it being, in part, to substitute another heir in place of the one then in possession. Mountford was to be his coadjutor in this. This man, deeply read in the secrets and history of the family, plays off all the different possessors of the property. Dying, the Doctor leaves this man to be an uncontrolled agent of the mischief which he himself had set on foot. Yet it shall turn out in

the end that Mountford had unwittingly made a victim of himself as well as the other personages. The representatives of this ancient and noble family had each been led to do some most unworthy thing. Could there be, through all these times, some person hidden in the old house? Could the old Doctor himself be hidden there, being only supposed to be dead? I don't see this at present. The Doctor, by his subtlety, had saved this Mountford from the gallows. He held him in the bonds of love and fear. He had laid his commands on him, before leaving the country, to do continually some one act the constant repetition of which produces the strangest consequences. He has hidden some person, whom he wished to keep from the knowledge of the world, in a secret place of the old house, and has commanded this old fellow to feed and nourish and supply him with books, but never to let him out; and, after the old man has been doing it for a few years, of course it is impossible that he should do otherwise. Who is the prisoner? The true heir of the estate? He might have disappeared suddenly, and been supposed to be murdered. On coming into the property and title, the present possessor shall have been made aware of this dreadful secret, and shall have adopted the guilt as his own. There shall be no cruelty in the treatment of the person, except just the solitary confinement. He might have committed some crime by which he shall be justly condemned to this punishment, had it been by a competent jurisdiction. There must be much talk about this person in the romance; doubts whether he be dead, whether he may not have gone to America, so that the reproduction of him shall not strike the reader altogether unexpectedly. But the absurd impossibility of the thing? Why so? Should it be man or woman? The woman whom the Doctor loved, and who was false to him? This would be too shocking? It should be the man who wronged him, if anybody. The Doctor, by some of his chemical contrivances, had taken from him the power of speech, had paralyzed him in some way, and hidden him here; and he himself goes to America to find out the true heir. This Mountford remains in the house. He is a sort of upper servant. An old priest's chamber readily enough supplies the prison-place. This ghastly thing, without people's well knowing why, has made the house horrible. The Doctor might have meant to poison him, but only succeeded in paralyzing him to a certain extent. There seems to be something in this ugly idea which may eventually answer the purpose; but not as I see it now.

One great point must be the power of the old Doctor's character, operating, long years after his death, just as when he was alive. The prisoner should have been very wicked, and worthy of his doom: seducing the Doctor's young wife, and taking her home into his mansion; the wife may have committed suicide, and been deposited in the old coffer, and have there turned to golden hair. The old Doctor was a man of wonderful scientific skill. He had preserved a man that had been hanged, and thus got him in complete subjection to him; the man had been unjustly accused of crime, but he was of a nature strongly impressible by another's force of character. The Doctor had made him, as it were,—created him anew,—and he never could dream of being released from his authority. This man, by his recommendation, had been received into the Braithwaite family, with which the man of science was intimate. The Doctor had a beautiful wife, who was seduced by Mr. (or Lord) Braithwaite, and was taken by him to the old mansion. The Doctor finds them there; the wife kills herself, and is buried in the coffer. The man is paralyzed, and kept in confinement, under the guardianship of the half-hanged worthy. The Doctor goes abroad, leaving matters in this state. There has been such an arrangement of incidents, that it appears as if the heir had gone abroad with the Doctor's wife, instead of coming home; that had been his intention, and he had arranged matters with his stewards and agents as if for a long absence. He stays away a long, long time, indeed; nothing is heard of him; he has vanished; and by and by another heir possesses the estate, after it has gone through a course of law and been assigned to him. It was at this period, perhaps, that the legal gentleman comes from London, to search for the grave. All these things being presupposed, the first part of the romance may stand pretty much as before shadowed out, with such deepening and darkening of the effect as will come from such presupposition; but the lights must be made brighter in proportion.

Then in England: Etheredge arrives, and takes up his abode in the hospital pretty much as now. The Doctor's adherent must be pretty speedily brought forward, and must feel a strong interest in Etheredge, and be greatly moved on knowing (which he may soon know) that the American had known and been the protégé of the Doctor. He must be a very strange person in his habits and manners. The possessor of the estate must be described: an Italian, as already arranged. Since his accession, he has become

noted for strange and secluded habits. There must have been an heir previous to this one, who shall have died mad. He was a needy young man, suddenly exalted from the depths of poverty to this station. The old Doctor himself was mad. The warden must convey to Etheredge (perhaps in the form of a story) the aspect and fortunes of the family since the Doctor left England, now some thirty years ago.

A striking point may be made, in respect to the simple and kindly and upright, loyal, obedient nature of the Doctor's adherent.

The possessor of the estate shall have learned, somehow, of the probability that an American heir was coming, with proofs that would oust him. He has gone through so much, that he is not inclined to stop at any crime now; so he endeavors to murder him on his first arrival. Afterward he invites him to his house, with indefinite purposes; for sometimes he thinks of giving up the estate and the secret into his keeping, and be himself thus disburdened. He rather thinks he will poison him, or perhaps give the prisoner a companion.

In the Doctor's legend the existence of this secret chamber must be disclosed. The old pensioner must also speak of it, and perhaps tell a story about it.

Elsie glimmers through the story, and illuminates it with a healthy, natural light.

TRY back again. Raise the curtain as before, and discover the Doctor's study in the old house at the corner of the Charter street burial-ground; the Doctor is there, with two children. He himself is a mystery to his neighbors and the gossips of the town; but he appears to be an Englishman of learning and science, and is held in much account by those who know him, and believed to be a physician of London. Of studious and retired habits, frequenting only the public library; not going to church or chapel; sometimes walking on the sea-shore or in the country with the two children. The spider's to be much emphasized; and, very soon, the analogy of a plot to be suggested by the web of the great spider. Indications are early given of a troubled spirit, of a passionate grief, or sense of wrong, cherished and fondled deep within his consciousness, and perhaps affecting his reason. The beauty of the boy, the innocent gayety and native tenderness of the girl, are much dwelt upon; the fact of the boy's having been taken by the Doctor from the alms-house, and being [impressed] by him with the idea that he comes of high English blood. Letters are mentioned as being some-

times received from England, and the idea must be conveyed that the Doctor is connected with some train of events going on there. Early the old pensioner is introduced, preaching or praying in the street, and taking some sort of notice of the two children, and possibly of the old Doctor. The visit of an Englishman occurs, and the search in the burial-ground, where the boy finds a key. Finally, the death of the Doctor, who, at his demise, appears troubled in mind, and to be in doubt whether or no to tell the boy some secret, but dies without doing so—leaving to the boy some property which he possessed here in America, and to the girl some hereditary property in England.

Now, what has been the motive for this man's leaving England and coming hither, and what was indicated by the spider's web? He had saved an imperfectly-hanged person, and made him morally a slave: so far, good; and he thus has an instrument ready to assist him in perpetrate[ing] any monstrosity. But what? Then he has been deeply wronged by a gentleman in his neighborhood, a man of wealth and rank, against whom he vows and executes a dire revenge. How? He must somehow subjugate that man, and make him a prisoner and a slave in spite of his rank, and in spite of being himself an inhabitant of another country. In what way? Some continual operation on his mind; some constantly repeated impression, that makes him withdraw himself from society, and give himself up to one morbid way of life. What? He broods over a coffin, in which his beloved's ashes are inclosed? Pish! He has her con-cocted into a ring, which pinches his finger, giving him exquisite torment! Ah! somehow, he is thoroughly blighted by this Doctor's means. Certainly! This half-hanged villain serves him as faithfully as man may, obeying all his orders, except in just one apparently unimportant thing—in that one thing he obeys the Doctor. Very well! He daily, in obedience to the Doctor's instructions, pours a drop of a certain liquid into his wine. Indeed! He subserves some wicked design of his, to his eternal ruin. Very right! Any rich man may have such an attendant. He does not imprison his foe, but induces him to imprison himself. Lackaday! Let it be with his own consent that he inhabits the secret chamber of the old mansion, and sometimes prowls about the neighborhood. Vastly probable! It should be some contrivance by which this man of wealth becomes powerless in his enemy's hands, and for thirty years is constantly tortured, until torture becomes the necessity of his life. So easily said—so impossible to do! Try back! What had this gentleman.

done? He had seduced the young wife of this man? I don't like that. Or his daughter or sister? Not much better, though the sister a little. Or, by his faithlessness, he had brought to the grave the young sister, the only thing in life that this abstracted man of science valued. That might do passably well for the offense. Then he turns all the resources of his art and ingenuity to avenge himself on this man and his whole race. How easy to say such things! This man, whom he saved from hanging, the gentleman thinks him altogether devoted to himself, but in reality he is doing the bidding of the Doctor. The death and ruin of this girl shall, by the Doctor's contrivance, prove his misery, temporal and eternal. What shall I do? He might have embalmed a member of the family in some new way, so that he shall appear life-like—to what good end? The devil knows. I don't. The girl continues to live with him; no, she is dead. Some secret knowledge of the family he must have, by dint of which he counteracts all their prospects for good, and brings about their utter destruction. Pshaw! It ought to be a knowledge of the history of the family, and the character of its successive representatives, that the Doctor perpetrates his mischief. Somehow or other, a representative, long supposed dead, should be discovered to be still alive, either in confinement or strict voluntary seclusion. Etheredge should discover him, as he does now, and be present at his death. The family has been Catholic, and this should be imposed on him—or he may have imposed it on himself—as a penalty for some crime. What crime? It won't do! The Doctor has left his slave here to do mischief—one peculiar kind of mischief—what? Is the secret chamber affair too absurd? I fear it is: not only impossible, but, in a manner, flat and commonplace. Some old family trait must be prolonged into the present day—nothing else. The man whom the Doctor leaves behind must act the part of a household demon to the successive heirs; and it may be quite in character for him to do it, as he is a hanged criminal. He is intensely evil, with nothing good in him except his entire devotion to the Doctor; and even that, by the facilities of wickedness which it offers the latter, may be intended to wile him onward to hell. Well; then the Doctor has left an exceedingly wicked man to be the confidential servant of the family. This man must represent a demon. He fosters all wickedness in the young, and facilitates it in the old. When the Doctor went abroad he took measures to get this man into the service of Braithwaite, in order to do all the mischief he could, under the Doctor's guidance, and there must have

been one peculiar mode of evil which he specially had in view. What? Or perhaps he only meant him to be a household demon, with general aptitude for any mischief—he it murder or what not. I do not see the practicability of this. But this had better be the man's character: he shall be as wicked as possible, and dominated by a perception of greater wickedness in the Doctor. He leaves him with a general understanding that he is to do all possible mischief, and a special injunction to keep doing one particular thing. Well; specify—I can't; the unparticular things I may, or might, could, would, or should. Having always an agent of mischief at hand, there is (a) good deal of it done. All the evil desires of their hearts become deeds, by aid of an obsequious demon. So far, good. There might even be a suspicion of absolute demonism on the part of the servant. Let there be a chapter devoted to the introduction of this important character, in which his qualities shall be mystified, exaggerated, idealized; brought as near the preternatural as may be, and then quietly withdrawn almost within the limits of commonplace. The general features of the old English serving-man must be preserved, but he [must] be converted into a devil; a butler he should be—or steward? butler, I think. Boteler. A model of faithful service, too. A panderer for the young heir, etc., etc., etc. A great deal of grotesque fancy must be used in drawing this character. Oh, certainly! *Eheu, jam satis est*. I can't possibly make this out, though it keeps glimmering before me. But he has grown old in the house, with a sort of wicked fidelity difficult to describe—or to imagine. The moral of this might be—that if a man could have all the desires of his heart executed, there could be no way so sure of bringing him to hell. A man of great skill and resource. Come on! Conceive such a man, established in the family, and wholly devoted to the Doctor, who has sworn eternal vengeance against the family. What is wanted to consummate that revenge? Materials, and an opportunity. The material must be some long-standing trouble or hereditary predicament of the family. What? A crime which is bequeathed to each generation, and of which this servant becomes the instrument. It would do magnificently, if it were not an absurdity. What is the crime? Each son murders his father at a certain age; or does each father try to accomplish the impossibility of murdering his successor? This is not the right tack. One of the family to disappear of his own will, and to remain in seclusion: the story of "Wakefield" might afford some hint of it. He might do it from jealousy, for there should be an ostensible motive. He wishes to watch

his beloved and suspected one. This old servant might be in the secret, and it should be done by the Doctor's contrivance. So he should remain till the American came back and found him. He secludes himself from a morbid impulse, and finds himself caught, and can never get back again into society; so that he has given up all the opportunities of life by that one act. The Doctor promotes it in the first instance, and makes it next to impossible for him to return into the world, in the next. The old servant is the agent who makes it impossible for him to get back, by the easiness of his keeping there. Is not this a glimpse? There must be a motive, in the first place, strong enough to keep him secluded a week; then, let him get out if he can. The fact would show that a strange repulsion—as well as a strong attraction—exists among human beings. If we get off, it is almost impossible to get back again. There is a vein of morbid singularity in this old family, of which the Doctor is aware. It is a very common thing—this fact of a man's being caught and made prisoner by himself. When Etheredge comes, he should be led to the chamber, perhaps, by his acquaintance with the chamber as derived from the Doctor. But there must be a strong, original motive; else, however natural, it will appear outrageously absurd. Now, what can be the motive? He has fallen in love with, and tried to seduce, the Doctor's young sister; possibly he has seduced her, and she has died. There is a strong popular feeling on this point, and he is forced to seclude himself. Or he may, in the riot of his youthful blood, have committed an offense against the laws, for which it is convenient for him to go into temporary hiding, and he naturally betakes himself to the secret chamber of his own old mansion. The Doctor facilitates this, and makes it easy for him to stay, difficult for him to come forth. So there he is; and he goes to America, leaving him in charge of this devoted servant. By and by he comes to dread the face of man, and to dread being seen by them; and so he grows from youth to age. I think it should be vengeance for a crime. The seduction and death of the Doctor's sister; the Doctor, a terrible man, threatens vengeance. The Doctor contrives that a dead body shall be found, and taken to be that of Braithwaite. The crime alleged should be that of murder of the girl, but he shall not have meditated anything worse than a vicious connection. Each successive inheritor of the estate shall be duly taken into the secret, as before, and made wretched and guilty by it. It shall be something rather affecting the sanity of the old family; and the moral shall be, these old families become insane.

He might have seduced or broken the heart (which would be better) of the Doctor's sister. A quarrel ensues, in which he has reason to suppose that he has killed the Doctor, and that the law will be wreaked on him. He takes refuge in the secret chamber of the mansion, confiding himself to the care of the half-hanged man; who, being a devoted adherent of the Doctor, acts according to his instructions, and so makes him a life-long prisoner. The Doctor, his family being disgraced, his affections outraged, chooses to vanish from life, and departs from America, leaving no record behind him—no knowledge of where he is—except with the servant. He goes abroad with the purpose of pursuing his revenge upon the whole race of his enemy; with this view, knowing the family history, he determines to rake up a false heir, who shall oust the present possessors.

In the Romance, after the first two or three chapters, describing the Doctor and his surroundings, there must be introduced one in which this self-imprisoned man must be described—still young, cherishing purposes of coming out into the world, but deferring it till another day. Various tokens must be shown of what and whereabouts he is, and what his situation, but so as to rouse conjecture, not to satisfy it; and a connection must be intimated between him and the plot signified by the Doctor's spider's web. The reader, like the prisoner himself, may see no reason to suppose that he will not be at liberty at any moment; indeed, the situation must be so imperfectly defined, that he shall seem at liberty now.

Again, at an after-period, just before the Doctor's death, or possibly just after his death (or his death should be noticed, and an effect of it suggested), and before the opening of the scene in England, the prisoner must be introduced, now some years older; the effect of these imprisoned years must be developed; his growing horror of the world, yet sometimes a passionate yearning to get back into it. Then again, in order to fill up the gap between the two parts of the story, remove the prisoner forward again ten years more. Show him with the marks of coming age, and his faculties growing torpid through disuse. Still have allusions to the Doctor and the spiders, etc. It must not be indicated, as yet, where the prisoner is, nor, perhaps, must it yet be quite certain that he is only self-confined.

Again, after Etheredge has arrived in England, there must be another chapter, showing the prisoner as he now is. There may be strong indications, now, that the prisoner is confined in the mansion-house; and perhaps

one of the *Warder's* stories may have led the reader to conjecture that it is a former possessor of the house. It must be so managed as to make the house awful.

Finally, at whatever expense of absurdity, *Etheredge* must meet the man in his prison, as already seen. The surprise, disturbance, fear of man that has grown upon him, probably strike the life out of the poor old cuss, after thirty years of confinement. His mind, I think, should at all times be full of the Doctor—haunted by some impression of him; but, except in this one part of his self-confinement, there must be no intensity. He may be a young man of an exceedingly sensitive nature, who has fallen into one fault, sin, crime; yet he might have been the flower of all the race, under happier circumstances. A poetic nature, able to console himself with imaginative reveries. Sometimes, a dreadful glimpse of the way in which he is spending life. A lack of animal spirits, of native energy. He has books and writing materials. Possibly there might be two motives for seclusion: one, disappointed love, a passion hopeless, wrecked; the other, a sense of crime. The girl [———] whom his shy nature ever loved, is dead; he thinks that he has murdered her brother. So he secludes himself, at once afraid and weary of the world. The devil becomes the turnkey at the prison-gate, and he is inevitably shut in, except for one brief time, when he goes forth. Throughout life, still a purpose to emerge.

This runs through the Romance, like the vertebræ of the backbone. There should be a reference to it in everything, grave or gay. Now the girl. She has been sent out from England by the servant. Can that be the daughter of the Doctor's sister? That would make her too old. Well, merely a female relative, the only one of his race. Or could she belong to the old pensioner—a niece of his? Only, in that case, how came she ever to be under the Doctor's charge? True. Might she be the daughter of this sister? or might this be left in doubt, and only suggested by the fact of his taking charge of her, and feeling evidently a great interest in her? \* \* This seems best. What is her situation when *Etheredge* finds her in England? Can she have been brought back by the pensioner? Or, can she have come back to the protection of a person who had taken care of her until she was sent over to the Doctor in America? The old servant is the only person who has heretofore had anything to do with her. The Doctor has left her sufficient for her support, in a moderate way; only she wants a position, it seems to me. Could she pos-

sibly be made a resident of the house? I think not; for it is requisite to give her a certain respectability of external position. An actress? A rope-dancer? An appurtenance of a wandering show? It must be kept in mind that *Etheredge* is to marry her, which he can hardly do if she sinks below the level of respectability. She must be an artist, or may. A school-mistress; a seamstress? None of these. It is so desirable to connect her with the pensioner, that I don't well see how to do anything else. He had met with her in America, and taken a great interest in her, she being still a child; and when he came to England, had brought her with him; or had come for that very purpose, among others. Perhaps he had had an interview with the old Doctor, shortly before the death of the latter, in which interesting matters had past; and perhaps it was what he had learnt in this interview that the Doctor was ineffectually moved to communicate to *Etheredge* in his last moments. The pensioner might have satisfied the Doctor that he was the representative of the elder line. He confides her to him, and he takes charge of her. But, of course, the Doctor did not leave her dependent on the pensioner, while he was making *Etheredge* independent of the world? But, somehow, the pensioner took charge of her, and brought her to England, and she was to him as a daughter. Her property had been embezzled, perhaps, and she was left to support herself as she could; and the New England air had quickened her capacity in this respect. She has some peculiar little hand-work which enables her to get a living; something that she had learnt in America. Indian manufactures, with beads? No. She sells Indian meal, done up in neat packages, for washing hands. Oh! the devil. It shall not be told, at the close of the American part, that the girl is taken charge of by the pensioner; but so it shall prove to be. Well, she can be received in England by an old maiden relative, where she may live in a narrow way, sketching and otherwise idly employing herself, and longing for the wide sphere that America opens to women. The owner of *Braithwaite Hall* has seen her and fallen in love with her, and, perchance, tried to ruin her; but she rejects him. She comes often to see the pensioner at the hospital, and must be mixed up somehow with the story. The *Braithwaite* man might even have sought her for a wife, and it might be his jealousy that partly prompts to murder *Etheredge*, as he intends, though the fidelity of the serving man to the old Doctor induces him only to administer a sleeping potion, and so introduce him to the hidden inhabitant of the

Hall. This girl must be cheerful, natural, reasonable, beautiful, spirited, to make up for the deficiencies of almost everybody else. Something of wildness in her, intimating an origin not exactly normal, but yet nothing extravagant or unwomanly. The Indian bead-work may do.

Now for the old pensioner—his origin, pursuit, biography. He is the descendant of the eldest branch of the family and its representative. According to his theory [of] matters, early in the King's troubles with Parliament, his ancestor, being of a religious temperament, became a preacher of a reformed doctrine, very much like those of George Fox. On this account the family, who were then Catholics, rejected him and thrust him violently forth, some say wounded, so that the track of a Bloody Footstep was left behind him on the threshold. He disappears, going to America, where again he is persecuted by the Puritans, but founds a race who keep up his own faith, some of his traditions, his unworldliness. The name was changed (perhaps for that of his mother) on his first being thrust out from his father's family.

On the other hand, showing the unreliability of tradition, the family at home have a legend that this person was a fierce and violent religionist, that he fought outrageously against the king, and was even so devilishly inimical that he was the masqued executioner who beheaded him. Always, afterward, his foot was liable to make a bloody track, as was evidenced, among other things, by the extant bloody foot-print on the threshold, when he was thrust forth from his father's house by his horror-stricken family. They also say that he emigrated to America and made bloody tracks on the forest-leaves.

Rumors of his existence, and of a family springing from him, remain in England almost to the present day. Messengers, from age to age, are sent in quest of him: for, if he left a still surviving race, they would now be at the head of the family, with claims to the estate and an ancient barony that has since fallen in; for the [line] of the eldest son is extinct, though there is a lineage through two younger sons. This has given rise to the Doctor's substitution of Etheredge.

Well, the Pensioner inherits the religious spirit of his ancestor—a mild, gentle, sweet unyieldingness of character which has always distinguished this branch of the family: an apostolic character. The spirit of his fathers blossoms out in him more strenuously than in several preceding generations, and he is moved to preach; but his doctrines have not enough quackery and humbug about them to make any mark in the world, for he merely

preaches the purest Christianity. So he is not successful; rather feeble, he may be pronounced by his auditors. At this period he encounters the Doctor and the two children. The Doctor is interested in him, asks him to his house, and talks with him. He reappears a little before the Doctor's death. On his first visit to the Doctor he shall betray a knowledge of some of the traditions of the family.

He has made no impression on the world, being of too mild and meek a spirit, though he has the possibility of a martyr in him, as his forefather had. Perhaps his forefather was hanged by the Puritans; I think so. At last, the little girl being committed to his charge, he takes her back to England, and, finding the hospital there, and being in a position to prove his claims, he takes up residence there. He knows his rights to represent the family; but, being unworldly, having modeled himself on the character of his martyred ancestor, he will not accept worldly honors. Besides, there is a certain want of the practical in his nature that hinders such claims on his part, and he has no family motives to induce him. Perhaps he sometimes goes out preaching in England, though this is probably frowned upon by the Warden. Take the character of Cowper for this man: melancholic, gentle, shy, conscientious, censorious, therefore not acceptable to his neighbors, though amiable. These little traits will give verisimilitude to the character. Weak, ineffectual, with bursts of great force at need; a want of the practical element in his nature.

He shall be conscious of something strange existent in the mansion-house. A delicacy of nature, coming from his former life, shall have taught him this. Possibly the wicked servant may have made some communications to him, knowing that he has been in communication with the Doctor, and reverencing, too, the holiness of his character. It is possible he may have met the self-imprisoned once, when he was straying abroad; but I think not. There ought to be some scene contrived in which his conscientiousness should be very severely tested. Perchance he discovers the secret, and Braithwaite tries to frighten him into silence by threats of death; or the unhangd villain might do it, but should finally let him go with the secret in his possession, influenced by [the] holiness of his character making itself felt. The scene might take place in the woods. This is worth working out. He might be a Fifth-Heavenly man; that is to say, obedient to the higher law within himself and rejecting human law when it interfered. In figure, Mr. Alcott.

## THROUGH ONE ADMINISTRATION.\*

BY FRANCES HODGSON BURNETT,

Author of "That Lass o' Lowrie's," "Haworth's," "Louisiana," "A Fair Barbarian," etc., etc.

### CHAPTER XXVI.

MRS. SYLVESTRE did not leave town early. The weather was reasonably cool, the house on Lafayette Square was comfortable, and Washington in spring is at its loveliest. She liked the lull after the season, and enjoyed it to its utmost, wisely refusing all invitations to fitful after-Lent gayeties. She held no more receptions, but saw her more intimate acquaintances in the evening, when they made their informal calls. With each week that passed, her home gave her greater pleasure and grew prettier.

"I never lose interest in it," she said to Arbuthnot. "It is a continued delight to me. I find that I think of it a great deal, and am fond of it almost as if it was a friend I had found. I think I must have been intended for a housewife."

Mrs. Merriam's liking for Lawrence Arbuthnot having increased as their acquaintance progressed, his intimacy in the household became more and more an established fact.

"One should always number, among one's acquaintance," the clever dowager remarked, "an agreeable, well-bred, and reliable man-friend. A man one can ask to do things, if unforeseen occasions arise. He must be agreeable, since one must be intimate with him, and for the same reason he must be well-bred. Notwithstanding our large circle, we are a rather lonely pair, my dear."

Gradually Mrs. Sylvestre herself had found a slight change taking place in her manner toward Arbuthnot. She became conscious of liking him better, and of giving him more mental attention, as she saw him more familiarly. The idea dawned by slow degrees upon her that the triviality of which she accused him was of an unusual order; that it was accompanied by qualities and peculiarities which did not seem to belong to it. She had discovered that he could deny himself pleasures he desired, that he was secretly thoughtful for others, that he was—also secretly—determined, and that he had his serious moments, however persistently he endeavored to conceal them. Perhaps the Professor had given her more information con-

cerning him than she could have gained by observation in any comparatively short space of time. "This frivolous fellow," he said to her one night, laying an affectionate hand on Arbuthnot's arm, as they were on the point of leaving the house together, after having spent the evening there, "this frivolous fellow is the friend of my old age. I wonder why."

"So do I," said Arbuthnot. "I assure you that you could not find a reason, Professor."

"There is a kind of reason," returned the Professor, "though it is scarcely worthy of the name. This frivolous fellow is not such a trifler as he seems, and it interests me to see his seriousness continually getting the better of him when he fancies he has got it under and trodden it beneath his feet."

Arbuthnot laughed again—the full, careless laugh which was so excellent an answer to everything.

"He maligns me, this dissector of the emotions," he said. "He desires artfully to give you the impression that I am not serious by nature. I am, in fact, seriousness itself. It is the wicked world which gets the better of me."

Which statement Mrs. Sylvestre might have chosen to place some reliance in as being a plausible one, if she had not seen the Professor at other times, when he spoke of this friendship of his. It was certainly a warm one, and, then feeling that there must be reason for it, she began to see these reasons for herself, and appreciate something of their significance and value.

The change which finally revealed itself in her manner was so subtle in its character that Arbuthnot himself could not be sure when he had first felt it; sometimes he fancied it had been at one time, and again at another, and even now it was not easy for him to explain to himself why he knew that they were better friends.

But there was an incident in their acquaintance which he always remembered as a landmark.

This incident occurred at the close of the season. One bright moonlight night, having a fancy for making a call upon Bertha, who was not well enough to go out for several days, Mrs. Sylvestre made the visit on foot,

\* Copyright, 1881, by Frances Hodgson Burnett. All rights reserved.

accompanied by her maid. The night was so pleasant that they were walking rather slowly under the trees near Lafayette Park, when their attention was attracted by the sound of suppressed sobbing, which came from one of two figures standing in the shadow, near the railings, a few yards ahead of them. The figures were those of a man and a young woman, and the instant she saw the man, who was well-dressed, Agnes Sylvestre felt her heart leap in her side, for she recognized Lawrence Arbuthnot. He stood quite near the woman, and seemed trying to console or control her, while she—less a woman than a girl, and revealing in her childish face and figure all that is most pathetic in youth and helplessness—wept and wrung her hands.

"You must be quiet and have more confidence in——" Agnes heard Arbuthnot say; and then, prompted by some desperate desire to hear no more and to avoid being seen, she spoke to her maid.

"Marie," she said, "we will cross the street."

But, when they had crossed the street, some chill in the night air seemed to have struck her, and she began to shiver so that Marie looked at her in some affright.

"Madame is cold," she said. "Is it possible that Madame has a chill?"

"I am afraid so," her mistress replied, turning about hurriedly. "I will not make the visit. I will return home."

A few minutes later, Mrs. Merriam, who had settled her small figure comfortably in a large arm-chair by the fire, and had prepared to spend the rest of the evening with a new book, looked up from its first chapter in amazement as her niece entered the room.

"Agnes!" she exclaimed. "What has happened? Are you ill? Why, child! you are as white as a lily."

It was true that Mrs. Sylvestre's fair face had lost all trace of its always delicate color, and that her hands trembled as she drew off her gloves.

"I began—suddenly—to feel so cold," she said, "that I thought it better to come back."

Mrs. Merriam rose anxiously.

"I hope it is not malaria after all," she said. "I shall begin to think the place is as bad as Rome. You must have some hot wine."

"Send it upstairs, if you please," said Agnes. "I am going to my room: there is a large fire there."

And she went out as suddenly as she had appeared.

"I really believe she does not wish me to follow her," said Mrs. Merriam to herself.

"Is this malaria?" And having pondered upon this question, while she gave orders that the wine should be heated, she returned to her book after doing it, with the decision "No, it is not."

Agnes drank very little of the wine when it was brought. She sat by the fire in her room and did not regain her color. The cold which had struck her, had struck very deep; she felt as if she could not soon get warm again. Her eyes had a stern look as they rested on the fire; her delicate mouth was set into a curve of hopeless, bitter scorn; the quiet which settled upon her was even a little terrible, in some mysterious way. She heard a ring at the door-bell, but did not move, though she knew a caller was allowed to go to Mrs. Merriam. She was not in the mood to see callers; she could see nobody; she wished to be left alone. But, in about half an hour, a servant came to her room.

"Mr. Arbuthnot is down-stairs, and Mrs. Merriam wishes to know if Mrs. Sylvestre is better."

Mrs. Sylvestre hesitated a second before she replied.

"Say to Mrs. Merriam that I am better, and will join her."

She was as white as ever when she rose, even a shade whiter, and she felt like marble, though she no longer trembled.

"I will go down," she said, mechanically. "Yes, I will go down."

What she meant to say or do when she entered the room below, perhaps she had not clearly decided herself. As she came in, and Arbuthnot rose to receive her, he felt a startled thrill of apprehension and surprise.

"I am afraid you are not really better," he said. "Perhaps I should not have asked to be allowed to see you."

He had suddenly an absurd feeling that there was such distance between them—that something inexplicable had set them so far apart that it might almost be necessary to raise his voice to make her hear him.

"Thank you," she replied. "I was not really ill," and passed the chair he offered her, as if not seeing it, taking another one which placed the table between them.

Arbuthnot gave her a steady glance and sat down himself. Resolving in a moment's time that something incomprehensible had happened, he gathered himself together with another resolve which did equal credit to his intelligence and presence of mind. This resolution was that he would not permit himself to be overborne by the mystery until he understood what it was, and that he would understand what it was before he left the house, if such a thing were possible. He had

the coolness and courage to refuse to be misunderstood.

"I should not have hoped to see you," he said, in a quiet, level tone, still watching her, "but Mrs. Merriam was so kind as to think you would be interested in something I came to tell her."

"Of course she will be interested," said Mrs. Merriam. "Such a story would interest any woman. Tell it to her at once."

"I wish you would do it for me," said Arbuthnot, with a rather reluctant accession of gravity. "It is really out of my line. You will make it touching—women see things so differently. I'll confess to you that I only see the miserable, sordid, forlorn side of it, and don't know what to do with the pathos. When that poor, little wretch cried at me and wrung her hands, I had not the remotest idea what I ought to say to stop her—and heaven knows I wanted her to stop. I could only make the mistaken remark that she must have confidence in me, and I would do my best for the childish, irresponsible pair of them—though why they should have confidence in me I can only say 'heaven knows,' again."

After she had seated herself, Agnes had lightly rested her head upon her hand as if to shade her eyes somewhat. When Arbuthnot began to speak she had stirred, dropping her hand a moment later and leaning forward; at this juncture she rose from her chair, and came forward with a swift, unconscious-looking movement. She stood up before Arbuthnot, and spoke to him.

"I wish to hear the story very much," she said, with a thrill of appeal in her sweet voice. "I wish you to tell it to me. You will tell it as—as we should hear it."

Nothing but a prolonged and severe course of training could have enabled Arbuthnot to preserve at this moment his outward composure. Indeed, he was by no means sure that it was preserved intact; he was afraid that his blonde countenance flushed a little, and that his eyes were not entirely steady. He felt it necessary to assume a lightness of demeanor entirely out of keeping with his mental condition.

"I appreciate your confidence in me," he answered, "all the more because I feel my entire inadequacy to the situation. The person who could tell it as you ought to hear it is the young woman who waylaid me with tears near Lafayette Park about half an hour ago. She is a very young woman, in fact, an infant, who is legally united in marriage to another infant, who has been in the employ of the Government, in the building I adorn with my presence. Why they felt it incumbent upon themselves to marry on an income of seventy-five dollars a month they do not

explain in any manner at all satisfactory to the worldly mind. They did so, however, and lived together for several months in what is described as a state of bliss. They had two small rooms, and the female infant wore calico gowns, and did her own ridiculous, sordid, inferior housework, and rejoiced in the society of the male infant when a grateful nation released him from his daily labors."

Agnes quietly slipped into the chair he had first placed for her. She did it with a gentle yielding movement, to which he was so little blind that he paused a second and looked at the fire, and made a point of resuming his story with a lighter air than before.

"They could not have been either happy or content under such absurd circumstances," he said, "but they thought they were. I used to see the male infant beaming over his labors in a manner to infuriate you. His wife used to come down to bear him from the office to the two rooms in a sort of triumphal procession. She had round eyes and dimples in her cheeks, and a little, round head with curls. Her husband, whose tastes were simple, regarded her as a beauty, and was given to confiding his opinion of her to his fellow clerks. There was no objection to him but his youth and innocence. I am told he worked with undue enthusiasm in the hope of keeping his position, or even getting a better one, and had guileless, frenzied dreams of being able in the course of the ensuing century to purchase a small house 'on time.' I don't ask you to believe me when I tell you that the pair actually had such a house in their imbecile young minds, and had saved out of their starvation income a few dollars toward making their first payment on it. I didn't believe the man who told me, and I assure you he is a far more reliable fellow than I am."

He paused a second more. Was it possible that he found himself obliged to do so?

"They said," he added, "they said they 'wanted a home.'"

He heard a soft, little sound at his side—a soft, emotional little sound. It came from Mrs. Sylvestre. She sat with her slender hands clasped upon her knee, and as the little sound broke from her lips, she clasped them more closely.

"Ah!" she said. "Ah! poor children!"

Arbuthnot went on.

"Ought I to blush to admit that I watched these two young candidates for Saint Elizabeth, and the poor-house, with interest? They assisted me to beguile away some weary hours in speculation. I wondered when they would begin to be tired of each other; when they would find out their mistake, and loathe

the paltriness of their surroundings; when the female infant would discover that her dimples might have been better invested, and that calico gowns were unworthy of her charms? I *do* blush to confess that I scraped an acquaintance with the male infant, with a view to drawing forth his views on matrimony and life as a whole. He had been wont to smoke inferior cigarettes in the days of his gay and untrammelled bachelorhood, but had given up the luxurious habit on engaging himself to the object of his affections. He remarked to me that 'a man ought to have principle enough to deny himself things when he had something to deny himself for, and when a man had a wife and a home he *had* something to deny himself for, and if he was a man he'd do it.' He was very ingenuous, and very fond of enlarging confidently upon domestic topics and virtues and joys, and being encouraged could be relied upon so to enlarge—always innocently and with inoffensive youthful enthusiasm—until deftly headed off by the soulless worldling. I gave him cigars, and an order of attention, which seemed to please him. He remarked to his fellow-clerks that I was a man who had 'principles' and 'feelings,' consequently I felt grateful to him. He had great confidence in 'principles.' The bold thought had presented itself to him that if we were more governed by 'principles,' as a nation, we should thrive better, and there would be less difficulty in steering the ship of state; but he advanced the opinion hesitantly, as fearing injustice to his country in the suggestion."

"You are making him very attractive," said Mrs. Merriam. "There is something touching about it all."

"He was attractive to me," returned Lawrence, "and he was touching at times. He was crude, and by no means brilliant, but there wasn't an evil spot in him, and his beliefs were of a strength and magnitude to bring a blush to the cheek of the most hardened. He recalled the dreams of youth, and even in his most unintelligently ardent moments appealed to one. Taking all these things into consideration, you will probably see that it was likely to be something of a blow to him to find himself suddenly thrown out upon the world without any resource whatever."

"Ah!" exclaimed Mrs. Sylvestre, earnestly. "Surely you are not going to tell us——?"

"That he lost his office," said Lawrence. "Yes. Thrown out. Reason—place wanted for some one else. I shouldn't call it a good reason myself. I find others who would not call it a good reason; but what are you going to do?"

"What did he do?" asked Agnes.

"He came into my room one day," answered Lawrence, "just as I was leaving it. He was white, and his lips trembled in a boyish way that struck me at the moment as being rather awful. He looked as if he had been knocked down. He said to me, 'Mr. Arbuthnot, I've lost my place,' and then, after staring at me a few seconds, he added, 'Mr. Arbuthnot, what would you do?'"

"It is very cruel," said Agnes. "It is very hard."

"It is as cruel as Death!" said Arbuthnot. "It is as hard as Life! That such a thing is possible—that the bread and home and hopes of any honest human creature should be used as the small change of power above him, and trafficked with to sustain that power and fix it in its place to make the most of itself and its greed, is the burning shame and burden which is slung around our necks, and will keep us from standing with heads erect until we are lightened of it."

He discovered that he was in earnest, and recklessly allowed himself to continue in earnest until he had said his say. He knew the self-indulgence was indiscreet, and felt the indiscretion all the more when he ended and found himself confronted by Mrs. Sylvestre's eyes. They were fixed upon him, and wore an expression he had never had the pleasure of seeing in them before. It was an expression full of charming emotion, and the color was coming and going in her cheek.

"Go on," she said, rather tremulously, "if you please."

"I did not go on," he replied. "I regret to say I couldn't. I was unable to tell him what I should do."

"But you tried to comfort him?" said Agnes. "I am sure you did what you could."

"It was very little," said Lawrence. "I let him talk, and led him on a little to—well to talking about his wife. It seemed the only thing at the moment. I found it possible to recall to his mind one or two things he had told me of her,—probably doing it in the most inefficient manner,—but he appeared to appreciate the effort. The idea presented itself to me that it would be well to brace him up and give him a less deathly look before he went home to her, as she was not very well, and a childish creature at best. I probably encouraged him unduly, but I had an absurd sense of being somehow responsible for the preservation of the two rooms and the peace of mind of the female infant, and the truth is I have felt it ever since, and so has she."

He was extremely conscious of Mrs. Sylvestre's soft and earnest eyes.

"That was the reason she called to see me to-night, and finding I had just left the house, followed me. Tom is ill—his name is Tom Bosworth. It is nearly two months since he lost his place, and he has walked himself to a shadow in making efforts to gain another. He has written letters and presented letters; he has stood outside doors until he was faint with hunger; he has interviewed members of congress, senators, heads of departments, officials great and small. He has hoped and longed and waited, and taken buffetings meekly. He is not a strong fellow, and it has broken him up. He has had several chills, and is thin and nervous and excitable. Kitty—his wife's name is Kitty—is pale and thin too. She has lost her dimples, and her eyes look like a sad little owl's, and always have tears in them which she manages to keep from falling so long as Tom is within sight. To-night she wanted to ask me if I knew any ladies who would give her sewing. She thinks she might sew until Tom gets a place again."

"I will give her sewing," exclaimed Agnes. "I can do something for them if they will let me! Oh, I am very glad that I can."

"I felt sure you would be," said Arbuthnot. "I thought of you at once, and wished you could see her as I saw her."

She answered him a little hurriedly, and he wondered why her voice faltered.

"I will see her to-morrow," she said, "if you will give me the address."

"I have naturally wondered if it was possible that anything could be done for the husband," he said. "If you could use your influence in any way—you see how inevitably we come to that—it always becomes a question of influence—our very charities are of the nature of schemes; it is in the air we breathe."

"I will do what I can," she replied. "I will do anything—anything you think would be best."

Mrs. Merriam checked herself on the very verge of looking up, but though by an effort she confined herself to apparently giving all her attention to her knitting-needles for a few moments, she lost the effect of neither words nor voice. "No," she made mental comment, "it was *not* malaria."

Arbuthnot had never passed such an evening in the house as this one proved to be, and he had spent many agreeable evenings there. To-night there was a difference. Some barrier had melted or suddenly broken down. Mrs. Sylvestre was more beautiful than he had ever seen her. It thrilled his very soul to hear her speak to him and to look at her. While still entirely ignorant of the cause of her displeasure against him, he knew that it was re-

moved; that in some mysterious way she had recognized the injustice of it, and was impelled by a sweet, generous penitence to endeavor to make atonement. There was something almost like the humility of appeal in her voice and eyes. She did not leave him to Mrs. Merriam, but talked to him herself. When he went away, after he left her at the parlor door, she lingered a moment upon the threshold, then crossed it, and followed him into the hall. They had been speaking of the Bosworths, and he fancied she was going to ask some last question. But she did not; she simply paused a short distance from where he stood and looked at him. He had often observed it in her, that she possessed the inestimable gift of being able to stand still and remain silent with perfect grace, in such a manner that speech and movement seemed unnecessary; but he felt that she had something to say now and scarcely knew how best to say it, and it occurred to him that he might, perhaps, help her.

"You are very much better than you were when I came in," he said.

She put out her hand with a gentle, almost grateful gesture.

"Yes, I am much better," she said. "I was not well then—or happy. I thought that I had met with a misfortune; but it was a mistake."

"I am glad that it was a mistake," he answered. "I hope such things will always prove so."

And a quick flush rising to his face, he bent and touched with his lips the slim, white fingers lying upon his palm.

The flush had not died away when he found himself in the street; he felt its glow with a sense of anger and impatience.

"I might have known better than to do such a thing," he said. "I *did* know better. I am a fool yet, it seems—a fool!"

But, notwithstanding this, the evening was a landmark. From that time forward Mrs. Merriam looked upon their intimacy with renewed interest. She found Agnes very attractive in the new attitude she assumed toward their acquaintance. She indulged no longer in her old habit of depreciating him delicately when she spoke of him—which was rarely; her tone suggested to her relative that she was desirous of atoning to herself for her past coldness and injustice. There was a delicious hint of this in her manner toward him, quiet as it was; once or twice Mrs. Merriam had seen her defer to him, and display a disposition to adapt herself to his opinions, which caused a smile to flicker across her discreet countenance. Their mutual interest in their *protégés* was a tie between them, and devel-

oped a degree of intimacy which had never before existed. The day after hearing their story, Agnes had paid the young people a visit. The two rooms in the third story of a boarding-house presented their modest household goods to her very touchingly. The very bridal newness of the cheap furniture struck her as being pathetic, and the unsophisticated adornments in the form of chromos and bright tidies—the last Kitty's own handiwork—expressed to her mind their innocent sentiment. Kitty looked new herself, as she sat sewing in a little rocking-chair drawn near to the sofa on which Tom lay, flushed and bright-eyed, after his chill, but there were premonitory signs of wear on her pretty, childish face. She rose, evidently terribly nervous and very much frightened at the prospect of receiving her visitor, when Mrs. Sylvestre entered, and though reassured somewhat by the mention of Arbutnot's name, glanced timorously at Tom in appeal for assistance from him. Tom gave it. His ingenuous mind knew very little fear. He tried to stagger to his feet, smiling, but was so dizzy that he made an ignominious failure, and sat down again at Agnes's earnest request.

"Thank you," he said. "I will if you don't mind. It's one of my bad days, and the fever makes my head go round. Don't look so down-hearted, Kitty. Mrs. Sylvestre knows chills don't count for much. You see"—he said to Agnes, with an effort at buoyancy of manner—"they knock a man over a little, and it frightens her."

Agnes took a seat beside the little rocking-chair, and there was something in the very gentleness of her movements which somewhat calmed Kitty's tremor.

"It is very natural that she should feel anxious, even when there is only slight cause," Mrs. Sylvestre said, in her low, sweet voice. "Of course, the cause is slight in your case. It is only necessary that you should be a little careful."

"That's all," responded Tom. "And I'm going to be careful. A man with a wife and home can't be too careful. He's got others to think of besides himself."

But, notwithstanding his cheerfulness and his bright eyes, he was plainly weaker than he realized, and was rather glad to lie down again, though he did it apologetically.

"Mr. Arbutnot came in this morning and told us you were coming," he said. "You know him pretty well, I suppose."

"I see him rather frequently," answered Agnes; "but perhaps I do not know him very well."

"Ah!" said Tom. "You've got to know him very well to find out what sort of fellow

he is; you've got to know him as I know him—as *we* know him. Eh! Kitty?"

"Yes," responded Kitty, a little startled by finding herself referred to, "only you know him best, Tom. You see, you're a man—"

"Yes," said Tom, with innocent complacency, "of course it's easier for men to understand each other. You see—" to Agnes, though with a fond glance at Kitty—"Kitty was a little afraid of him. She's shy, and hasn't seen much of the world, and he's such a swell, in a quiet way, and when she used to come to the office for me, and caught a glimpse of him, she thought he was always making fun of everything."

"I thought he *looked* as if he was," put in Kitty. "And his voice sounded that way when he spoke to you, Tom. I even used to think, sometimes, that he was laughing a little at *you*—and I didn't like it."

"Bless you!" responded Tom, "he wasn't thinking of such a thing. He's got too much principle to make friends with a fellow and then laugh at him. What I've always liked in him was his principle."

"I think there are a great many things to like in him," said Mrs. Sylvestre.

"There's everything to like in him," said Tom, "though, you see, I didn't find that out at first. The truth is, I thought he was rather too much of a swell for his means. I've told him so since we've been more intimate, and he said that I was not mistaken, that he was too much of a swell for his means, but that was the fault of his means, and the Government ought to attend to it, as a sacred duty. You see the trouble is he hasn't a family. If he was married, and had some one to take care of, it would be different. And what a fellow he would be to take care of a woman! I told him that, too, once, and he threw back his head and laughed; but he didn't laugh long. It seemed to me that it set him off thinking, he was so still after it."

"He'd be very good to his wife," said Kitty, timidly. "He's very kind to me."

"Yes," Tom went on, rejoicing in himself, "he sees things that men don't see, generally. Think of his noticing that you weren't wrapped up enough that cold day we met him and going into his place to get a shawl from his landlady, and making me put it on!"

"And don't you remember," said Kitty, "the day he made me so ashamed, because he said my basket was too heavy, and would carry it all the way home for me?"

Tom laughed triumphantly.

"He would have carried a stove-pipe, just the same way," he said, "and have looked just as cool about it. You'd no need to be ashamed; *he* wasn't. And it's not only that:

see how he asks me about you, and cheers me up, and helps me along, by talking to me about you when I'm knocked over, and says that you mustn't be troubled, and I must bear up, because I've got you to take care of, and that when two people are as fond of each other as we are, they've got something to hold on to that will help them to let the world go by and endure anything that don't part them."

"He said that to me, too, Tom," said Kitty, the ready tears starting to her eyes. "He said it last night when I met him on the street and couldn't help crying because you were ill. He said I must bear up for you—and he was so nice that I forgot to be afraid of him at all. When I began to cry it frightened me, because I thought he wouldn't like it, and that made it so much worse that I couldn't stop, and he just put my hand on his arm, and took me into Lafayette Park, where there was a seat in a dark corner under the trees. And he made me sit down and said, 'Don't be afraid to cry. It will do you good, and you had better do it before me than before Tom. Cry as much as you like. I will walk away a few steps until you are better.' And he did, and I cried until I was quiet, and then he came back to me, and told me about Mrs. Sylvestre."

"He's got feelings," said Tom, a trifle brokenly, "he's got feelings and—and principles. It makes a man think better of the world, even when he's discouraged and it's dealt hard with him."

Mrs. Sylvestre looked out of the nearest window; there was a very feminine tremor in her throat, and something seemed to be melting before her eyes; she was full of the pain of regret and repentance; there rose in her mind a picture of herself as she had sat before the fire in her silent room; she could not endure the memory of her own bitter contempt and scorn; she wished she might do something to make up for that half hour; she wished that it were possible that she might drive down to the Treasury and present herself at a certain door, and appeal for pardon with downcast eyes and broken voice. She was glad to remember the light touch upon her hand, even though it had been so very light, and he had left her after it so hurriedly.

"I am glad he spoke to you of me," she said. "I—I am grateful to him. I think I can help you. I hope you will let me. I know a great many people, and I might ask for their influence. I will do anything—anything Mr. Arbutnot thinks best."

Tom gave her a warmly grateful glance, his susceptible heart greatly moved by the sweetness and tremor of her voice. She was just the woman, it seemed to him, to be the

friend of such a man as his hero; only a woman as beautiful, as sympathetic, and having that delicate, undefinable air of belonging to the great enchanted world, in which he confidently believed Arbutnot figured with unrivaled effect, could be worthy of him. It was characteristic of his simple nature that he should admire immensely his friend's social popularity and acquirements, and dwell upon their unbounded splendor with affectionate reverence.

"He's a society fellow," he had said to Kitty in his first description of him. "A regular society fellow! Always dressed just so, you know—sort of quiet style, but exactly up to the mark. He knows everybody and gets invited everywhere, though he makes believe he only gets taken in because he can dance and wait in the supper room. He's out somewhere every night, bless you, and spends half his salary on kid gloves and flowers. He says people ought to supply them to fellows like him, as they supply gloves and hat-bands at English funerals. He doesn't save anything; you know, he can't, and he knows it's a mistake, but you see when a fellow is what he is, it's not easy to break off with everything. These society people want such fellows, and they *will* have them."

It had been this liberal description of his exalted position and elegant habits, which had caused Kitty to stand greatly in awe of him, at the outset, and to feel that her bearing would never stand the test of criticism by so proficient an expert, and she had trembled before him accordingly and felt herself unworthy of his condescending notice, until having, on one or two occasions, seen something in his manner which did not exactly coincide with her conception of him as a luxurious and haughty worldling, she had gained a little courage. She had been greatly alarmed at the sight of Mrs. Sylvestre, feeling vaguely that she, also, was a part of these mysterious splendors; but after she heard the soft break in the tone in which she said, with such gentle simplicity, "I will do anything—anything—Mr. Arbutnot thinks best," she felt timorous no more, and allowed herself to be led into telling her little story, with a girlish pathos which would have melted Agnes Sylvestre's heart, if it had not been melted already. It might, perhaps, better have been called Tom's story than her own, as it was all about Tom—Tom's struggles, Tom's disappointments, Tom's hopes, which all seemed prostrated; the little house Tom had been thinking of buying and making nice for her; the member of Congress who had snubbed Tom; the Senator who had been rough with him; the cold he had taken; the chills and

fevers which had resulted; the pain in his side. "We have used all our money," she ended, with a touching little catch of her breath,— "if it had not been for Mr. Arbuthnot—Mr. Arbuthnot—"

"Yes," said Tom, wofully, "he'll have to go without a pair or so of gloves this month and smoke fewer cigars; and I couldn't have believed that there was a man living I could have borne to take money from, but, somehow, he made it seem almost as if he owed it me."

When Mrs. Sylvestre went away she left hope and comfort behind her. Kitty followed her into the passage with new light in her eyes.

"If I have the sewing," she said, clasping her hands, "it will be *such* a load off Tom's mind to know that we have a little money, that he will get better. And he knows I like sewing, so, perhaps, he will not mind it so much. I am so thankful to you! If Tom will only

get well," she exclaimed in a broken whisper, "if Tom will only get well!" And, suddenly, in response to some look on Agnes's face, and a quick, caressing gesture, she leaned forward and was folded in her arms.

It is very natural to most women to resort to the simple feminine device of tears, but it was not often Mrs. Sylvestre so indulged herself, and there were tears in her eyes and in her voice, too, as she held the gentle, childish creature to her breast. She had felt a great deal, during the last twenty-four hours, and the momentary display of emotion was a relief to her. "He will get better," she said, with almost maternal tenderness, "and you must help him by taking care of yourself and giving him no cause for anxiety. You must let me help to take care of you. We will do all we can—" and there was something akin to fresh relief to her in the mere use of the little word "we."

(To be continued.)

## A MOLE, A LAMPREY, AND A FAIRY.

### A MOLE.

WALKING through the fields one May morning, I surprised a mole above ground,—a very large specimen, one of the giants of his kind. It was an unwonted spectacle, something I had never seen before; this purblind, shovel-footed, subterranean dweller, this metaphysician of the earth, groping his way along in the open daylight. Had he grown tired then of the darkness, of the endless burrowings that lead nowhither, of undermining the paths and the garden, and cutting off the tender rootlets of the plants? He was ill equipped for traveling above ground; he was like a stranded fish; the soil was his element, and he knew it as well as I did. The moment I disturbed him he began to go into the ground as a diver into the water. When he moved, his tendency was downward, like a plow. It was amusing to see his broad, naked, muscular front feet, which turned outward and upward instead of downward, shovel their way through the grass into the turf. In less than half a minute he would nearly bury himself from view. Then by the tail I would draw him forth, and see him repeat the attempt. He did not look or feel about for a hole or for a soft place, but assaulted the turf wherever he touched it, his slender, sensitive nose feeling the way, and his huge, fleshy hands opening the passage. He was indeed a giant in these members;

they were to him what the wings of a bird are to the bird; all his powers and speed lay here; his hind legs were small and feeble, and often trailed behind him as if helpless or broken. Fancy a race of savages by some peculiar manual occupation developing an enormous hand, a hand as long and broad as a scoop shovel, usurping the wrist and the forearm, with the legs and feet proportionately small, and you have a type of this mole. This creature was a cripple at the surface, but a most successful traveler a few inches below. His fur was like silk plush, finer and softer than that of any creature known to me, excepting, perhaps, the bat. Why should these creatures of darkness have such delicate vestments? Probably because they *are* creatures of darkness. The owl is softer clad than the hawk, the hare than the squirrel, the moth than the butterfly.

I looked in vain for the mole's eyes. I blew open the fur, and explored the place with the point of a pin, but no eyes or semblance to eyes could I find, and I began to think that Aristotle was right in saying the mole is blind. Then I dispatched him, and stripped off his skin, and the eyes were revealed: two minute, black specks, that adhered to the tissues of the head after the skin was removed. It was only by the aid of a pocket glass that I was able to determine that they really were eyes. There was no eye-

socket, and I wondered that they had not come away with the skin. Probably the only use the mole has for eyes is to distinguish daylight from darkness, and for this purpose these microscopic dots may suffice, but as regards any other and more specific visual powers, he is practically blind.

#### A LAMPREY'S NEST.

ONE day late in spring as I was passing over a bridge I chanced to see two lampreys, or "lamper-eels," as they are usually called, engaged in building their nest in the creek below me. It was one of the most curious spectacles I ever saw in our stream. They were a few yards below the bridge, just where the water breaks from the still pool beneath it, and flows with a rapid current over its roughly paved bottom. They were distinguishable from the yellowish brown and black stones and pebbles amid which they were working only by their motions. They were tugging away at the small movable stones with great persistence. I went down to the water's edge where they were within reach of my staff, the better to observe them. They would run up to the edge of the still water and seize upon the stones with their suction mouth and drag them back with the current and drop them upon their nest. I understood at once why their nests, which I had often observed before, were always placed at the beginning of a rift; it is that the fish may avail themselves of the current in building them. The water sweeps them back with the pebble in their mouth, their only effort being in stemming the current to seize it. They are thus enabled to move stones which they could not stir in still water.

The stones varied in size from a walnut to a goose egg. When one of them was tugging away at a stone too heavy for it, I would lend a helping hand with my staff; I would move the stone along gently, and the lamprey seemed entirely unconscious of the fact that it was being helped; it would drop the burden at the proper point, and run up for another. Indeed my aid and presence did not disturb them at all. From time to time, the larger of the two, which was the female, would thrust her tail with great violence down among the pebbles at the bottom of the creek and loosen them up, and set free the mud which the current quickly carried away. The new material thus plowed up was carried to the nest. Twice in the course of the half-hour that I observed them, the act of spawning took place.

Besides helping move the larger stones with my staff, I several times plowed up the

bottom with its point, thus relieving the female of that duty. The fish took it all as a matter of course, and seized upon the pebbles I had loosened with great alacrity. When I thrust my cane beneath them and tried to lift them out of the water, they would suck fast to the stones and prevent me; but they did not manifest any alarm. The lampreys become much exhausted with the spawning and nest building, and large numbers of them die when it is over. In June it is not unusual to find their dead bodies in the streams they inhabit.

#### A LIVE FAIRY.

WHEN one makes long journeys, or penetrates remote and difficult places, he naturally expects to find strange and curious things, but one of the keenest pleasures the walker has, is in discovering, under his very nose, beside his familiar paths, and in ground that he thought he knew as he knows his own chimney corner, some creature, the like of which he has never before heard of, and which his neighbors and friends have never seen or heard of, yet which has disported itself there year after year, and which science has long known and has put old Rome under contribution to name. Such was my experience when, one April day, as I was peering into a little pool where I had peered a hundred times before, I suddenly discovered a creature—not one, but scores of them, disporting themselves in the clear water—creatures that were as new to me as a veritable nymph would have been. They were partly fish-shaped, from an inch to an inch and a half long, semi-transparent, with a dark brownish line visible the entire length of them (apparently the thread upon which the life of the animal hung, and by which its all but impalpable frame was held together), and suspending themselves in the water, or impelling themselves swiftly forward by means of a double row of fine, waving, hair-like appendages, that arose from what appeared to be the back, a kind of undulating, pappus-like wings. What was it? I did not know. None of my friends or scientific acquaintances knew. I wrote to a learned man, a great authority upon fish, describing the creature as well as I could. He replied that it was only a familiar species of phyllopodous crustacean, known as *eubranchipus vernalis*.

I remember that our guide in the Maine woods, seeing I had names of my own for some of the plants, would often ask me the name of this and that flower for which he had no word; and that when I could recall the full Latin term, it seemed overwhelmingly convincing and satisfying to him. It was evi-

dently a relief to know that these obscure plants of his native heath had been found worthy of a learned name, and that the Maine woods were not so uncivil and outlandish as they might at first seem: it was a comfort to him to know that he did not live beyond the reach of botany. In like manner I found satisfaction in knowing that my novel fish had been recognized and worthily named; the title conferred a new dignity at once; but when the learned man added that it was familiarly called the "fairy shrimp," I felt a deeper pleasure. Fairy-like it certainly was, in its ærial, unsubstantial look, and in its delicate, down-like means of locomotion; but the large head, with its curious folds, and its eyes standing out in relief, as if on the heads of two pins, were gnome-like. Probably the fairy wore a

mask, and wanted to appear terrible to human eyes. Then the creatures had sprung out of the earth as by magic. I found some in a furrow in a plowed field that had encroached upon a swamp. In the fall the plow had been there, and had turned up only the moist earth; now a little water was standing there, from which the April sunbeams had invoked these airy creatures. They belong to the crustaceans, but apparently no creature has so thin or impalpable a crust; you can almost see through them; certainly you can see what they have had for dinner, if they have eaten substantial food.

Crabs travel backward, and these phyllopods show the family trait by swimming on their backs; the position of the fish is reversed; mud is their mother, yet they turn their backs on it, and face the light and air above.

*John Burroughs.*

### THE DECLINE OF FAITH.

As in some half-burned forest, one by one,  
We catch far echoes on the dreary breeze,  
Born of the downfall of its ruined trees,—  
While even through those that stand slow shudderings run,  
As if Fate's hand were sternly laid thereon:—  
Thus, in a world smitten by foul disease—  
That Pest called Doubt—we mark by sad degrees,  
The fall of lordliest faiths that wooed the sun:  
Some, with low sigh of parted bough and leaf,  
Strain, quivering downward to the abhorred ground;  
Some totter feebly, groaning, toward their doom;  
While some, broad-centuried growths of old Belief,  
Sapped as by fire, defeatured, charred, discrowned,  
Fall with loud crash and long, reverberant boom!

Thus, fated hour by hour, more gaunt and bare,  
Gloom the wan spaces, whence—a Power to bless—  
Upbourgeoned once, in grace or stateliness,  
Some creed divine, offspring of light and air:  
What then? Ah! must we yield to bleak despair,  
Beholding God Himself wax less and less,  
Paled in the skeptical flame-cloud's whirl and stress,  
Till lost to love and reverence, hope and prayer?  
O Man! When trust is blind, and reason reels  
Before some fiery, fierce Iconoclast,  
Turn to thy Heart that reasons not, but feels;  
Creeds fall, shrines perish! "Still" (her Instinct saith),—  
"Still the soul lives; the soul must conquer Death!  
Hold fast to God, and God shall hold thee fast!"

*Paul Hamilton Hayne.*

## TOPICS OF THE TIME.

### The "Revolution" in American Politics.

IN referring to the recent elections, we wish to call attention first to a few special points :

1. It is usual, in all free countries, for reactionary tides to set in and sweep away a party which has been long in power ; but it is seldom that such reactions take place against an actual administration in times of great prosperity. It is true that the reaction in England against Beaconsfield was a moral and political movement ; at the same time, there is considerable truth in the assertion that the endless and damaging autumn rains had well-nigh as much to do with the Liberal success as did the damaging and endless speeches of Gladstone. But the reaction of the late American elections was entirely a moral one ; if the country farmer and city merchant thought it was "about time for a change," this opinion was not the unconscious effect of sordid or meteorological considerations.

2. So far as newspapers had to do with the result—and they had, of course, greatly to do with it—it is evident that the Republican party was beaten by Republican newspapers, no less than by Republican votes.
